

Moving between each stage

We undertake planning, collection of feedback, analysis and evaluation throughout each stage of transmission line routing. This cycle can be repeated until a final preferred route is determined.

Planning

- Consider opportunities and constraints.

Feedback and analysis

- Gather and review feedback from the engagement process and from specialists.
- Analyze information.

Comparative evaluation

- Compare routes based on criteria and feedback.
- Consider built, natural, and engineering perspective.

Selection

- Select preferred route or subset of routes.
