MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

LETTER OF APPLICATION

IN THE MATTER OF: *The Crown Corporations Public Review & Accountability Act* (Manitoba)

IN THE MATTER OF: An Application by Manitoba Hydro for an Order of the Public Utilities Board Approving Increases to Electricity Rates

TO: The Executive Director of the
Public Utilities Board of Manitoba
Winnipeg, Manitoba

1. Manitoba Hydro hereby applies to the Public Utilities Board of Manitoba ("PUB") for an Order pursuant to *The Crown Corporations Public Review & Accountability Act* for the following:

   a) Approval, on an interim basis, of rate schedules incorporating an across-the-board 3.95% rate increase to all components of the rates for all customer classes effective April 1, 2015, sufficient to generate additional revenues of $57 million in 2015/16;

   b) Approval of a further 3.95% across-the-board rate increase to all components of the rates for all customer classes effective April 1, 2016, sufficient to generate additional revenues of $60 million in 2016/17;

   c) Final approval of Orders 49/14 and 51/14 which approved, on an interim basis, a 2.75% rate increase effective May 1, 2014 applied on an across-the-board basis, and final approval of any other interim rate Orders issued subsequent to the filing of the Application and prior to conclusion of this proceeding;

   d) Final approval of the Light Emitting Diode ("LED") rates for the Area and Roadway Lighting class approved on an interim basis in Order 79/14;

e) Approval to implement Time-of-Use Rates for the General Service Large customer class served at greater than 30 kilovolts ("kV"), effective April 1, 2016, including the change in the definition of billing demand to be the highest measured on-peak demand in the month, 50% of contract demand or 50% of the highest on-peak demand in the previous 12 months;

f) Confirmation that the PUB accepts the rate approval process given proposed modifications to the Terms and Conditions of Option 1 of the Surplus Energy Program ("SEP") as outlined in Tab 6 of this Application, that were approved on an interim basis in Order 43/13;

g) Confirmation that the PUB accepts the rate approval process given proposed modifications to the Curtailable Rate Program ("CRP"), as outlined in Tab 6 of this Application, that were approved on an interim basis in Order 43/13;

h) Final approval of all SEP interim *ex parte* rate Orders as set forth in Tab 10 of this Application, as well as any additional SEP *ex parte* Orders issued subsequent to the filing of this Application and prior to the PUB's Order in this matter;

i) Final approval of CRP *ex parte* Order 46/14 as well as any additional *ex parte* Orders in respect of the CRP issued subsequent to the filing of this Application and prior to the PUB's Order in this matter;

j) Final approval of Orders 116/12 and 117/12 that approved, on an interim basis, a 6.5% rate increase to the full cost portion of the General Service and Government rates in the four remote communities served by diesel generation effective September 1, 2012, and final approval of diesel zone interim Orders 17/04, 46/04, 159/04, 176/06, 1/10, 134/10, 1/11 and 148/11, subject to confirmation that MKO has provided the parties to the agreement with the required affidavits from representatives of signatories to the agreement; and,

k) Approval to rescind the Demand Side Management deferral account established pursuant to Order 43/13 for the 2012/13 and 2013/14 fiscal years and on a go-forward basis.

2. Manitoba Hydro last filed a General Rate Application with the PUB on June 15, 2012 for the 2012/13 & 2013/14 fiscal years, which resulted in Order 43/13. This Order approved a 3.5% across-the-board general rate increase effective May 1, 2013, and directed that the revenues from a 1.5% portion of the increase accrue to an account to be utilized to mitigate the anticipated rate impacts when Bipole III is placed into service. Order 43/13 also provided final approval for Manitoba Hydro to maintain in its rates and revenues the 1% rate change that was previously approved by the PUB on an interim basis and subsequently rolled back in Order 5/12, final approval of the 2.0% interim rate increase granted in Orders 32/12 and 34/12 for April 1, 2012,

and final approval of the 2.4% interim rate increase granted in Orders 116/12 and 117/12 for September 1, 2012.

3. Subsequent to Order 43/13, Manitoba Hydro applied to the PUB for approval of an interim rate increase of 3.95% effective April 1, 2014, applied on an across-the-board basis to all customer classes. On May 5, 2014, the PUB issued Order 49/14 approving, on an interim basis, a 2.75% across-the-board general rate increase effective May 1, 2014, and directed that the revenues from a 0.75% portion of the increase accrue to the Bipole III deferral account established in Order 43/13. Subsequent to the issuance of Order 49/14, Manitoba Hydro filed a letter requesting the PUB to consider implementation of new LED rates for the Area and Roadway Lighting class on an interim basis effective August 1, 2014. This request was approved in Order 79/14.

4. By this Application, Manitoba Hydro is seeking approval, on an interim basis, of a 3.95% across-the-board general rate increase effective April 1, 2015 sufficient to generate additional revenue of $57 million in 2015/16, and a further across-the-board general rate increase of 3.95% effective April 1, 2016, sufficient to generate additional revenue of $60 million in 2016/17. The April 1, 2015 rate increase, if approved, would result in a $3.20 increase in the monthly bill of a residential customer without electric space heat using 1,000 kilowatt-hours ("kWh") per month, and a $6.11 increase in the monthly bill for a residential customer with electric space heat using 2,000 kWh per month. The April 1, 2016 rate increases, if approved, would result in a $3.33 increase in the monthly bill of a residential customer without electric space heat and a $6.36 increase in the monthly bill for a residential customer using electricity for space heat. For rates effective April 1, 2016, Manitoba Hydro is also requesting approval to implement TOU rates for the General Service Large customer class served at greater than 30 kV.

5. This Application provides prima facie support to provide the rate relief requested in this Application effective April 1, 2015. The subsequent regulatory process and public hearing will allow the PUB to confirm the interim rate increase and review the request for a further rate increase effective April 1, 2016. Approval of the rate increases proposed in this Application is required to maintain net income and financial ratios for 2015/16 and 2016/17 at acceptable levels. Absent the requested rate increases, Manitoba Hydro is projecting that over the 2015/16 and 2016/17 fiscal years, there would be no cumulative contribution to financial reserves and that financial ratios would deteriorate below acceptable levels. In making this Application, Manitoba Hydro has considered customer sensitivity to rate increases as well as the financial position of the Corporation, and believes the proposed rate increases are the minimum necessary in order to promote rate stability for customers and ensure the financial integrity of the Corporation.

6. The circumstances giving rise to the rate increases will be discussed in Tab 2 of the Application. Further information in support of the Application will be provided in Tab 3 to Tab 9 of the Application. In addition, Manitoba Hydro will address the responses to a number of PUB directives in Tab 10 of the Application.

Communication related to this Application should be addressed to Manitoba Hydro in the following fashion:

MANITOBA HYDRO

2015/16 & 2016/17 GENERAL RATE APPLICATION

OVERVIEW & REASONS FOR APPLICATION

INDEX

Appendices

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

OVERVIEW & REASONS FOR APPLICATION

2.0 OVERVIEW

The purpose of Tab 2 is to provide an overview of Manitoba Hydro's 2015/16 & 2016/17 General Rate Application and summary of the reasons for the Application.

Manitoba Hydro has a long history of providing safe, clean, reliable energy to Manitoba communities, households and businesses; energy that has fueled prosperity and economic growth in the province.

Manitoba Hydro also takes great pride in providing Manitobans with reliable service and some of the lowest electricity rates in North America. Manitoba Hydro has maintained stable rates through careful management of its assets, prudent spending on capital projects, and by managing its operating and administrative costs.

Today, Manitoba Hydro must invest in the system that has served customers for decades to ensure that it can continue to deliver safe, clean, reliable energy to Manitobans for generations to come. This required investment will mean that rates will need to increase gradually over the next decade to pay for these investments, and Manitoba Hydro believes that the rate increases proposed in this General Rate Application carefully balances the need for investment with the need to provide ratepayers with steady, predictable rates.

The key reasons for the Application are:

1. Manitoba Hydro is entering a period of extensive capital investment to meet the growing energy requirements of Manitoba, to replace aging utility assets and address increased capacity needs on the system.

2. While a portion of the required investments will be funded by cash flow from operations, the majority will be funded through unprecedented levels of debt financing.

3. The requirement for the proposed rate increases are primarily being driven by the required investments, which are expected to double the asset base and carrying costs (finance expense, depreciation and amortization expense and capital taxes) of Electric operations in the next 10 years.

4. Rate stability for customers is dependent on Manitoba Hydro maintaining its financial strength. The required investment in assets will place pressure on Manitoba Hydro's financial strength by deteriorating the financial results and key financial ratios.

5. The following significant risks are associated with rate increases lower than 3.95%:
    i. Increased risk to customers of rate instability and rate shock;
    ii. Increased risk to customers of decreases in service and reliability;
    iii. Increased borrowing requirements and associated financing costs, which will ultimately be recovered from customers;
    iv. Potential negative implications to the Provincial credit rating and Manitoba Hydro's borrowing costs.

6. Manitoba Hydro is committed to effectively controlling its OM&A costs and managing these costs below inflationary levels (excluding accounting changes that impact OM&A), during a time of significant and increasing cost pressures. This will assist in maintaining the 3.95% proposed rate increases.

7. The proposed 3.95% rate increases are the minimum that are required to maintain:
    i. A reliable energy supply to Manitobans, to which they are accustomed, and fund Power Smart Programs to assist customers in meeting their energy needs.
    ii. Rate stability and manage the deterioration in the Corporation's financial strength during the period of extensive capital investments.
    iii. Manitoba Hydro's 2015/16 and 2016/17 net income and financial ratios at acceptable levels.

2.1 MANITOBA HYDRO'S CORPORATE PROFILE & STRATEGIC DIRECTION

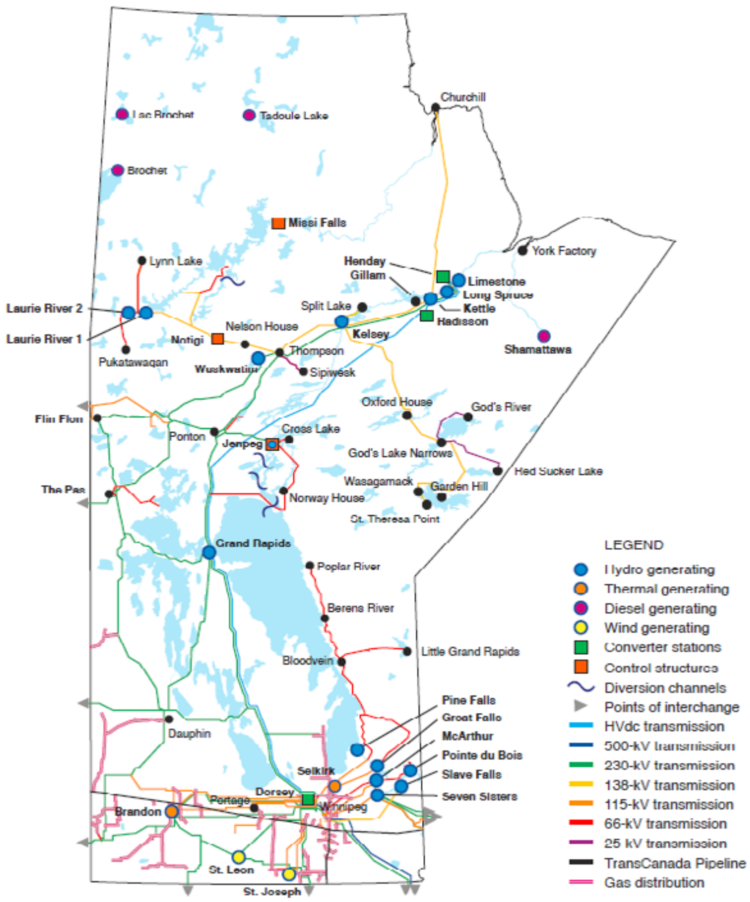
2.1.1 Corporate Profile

Manitoba Hydro is a provincial Crown Corporation governed by the Manitoba Hydro-Electric Board, whose members are appointed by the Lieutenant-Governor in Council. With over $16 billion in assets at historic cost, Manitoba Hydro is one of the largest integrated electricity and natural gas distribution utilities in Canada, with 5,725 megawatts of installed capacity. Manitoba Hydro serves over 555,000 electricity customers across Manitoba and 272,000 natural gas customers in the southern part of the province.

Manitoba Hydro has a long history of providing reliable energy to communities, households and businesses in Manitoba and operating one of the cleanest, most sustainable power systems in North America. Nearly all of the electricity Manitoba Hydro typically produces each year (approximately 98% on an energy basis) is clean, renewable water power generated at 15 hydro-electric generating stations. As part of it electrical system, Manitoba Hydro operates and maintains 13,000 kilometers of electric transmission lines, and 76,000 kilometers of electric distribution lines throughout the Province. Manitoba Hydro also maintains two thermal generating stations to back up its hydro-electric system and purchases electricity from two independent wind farms.

The following figure depicts Manitoba Hydro's major electrical and gas facilities.

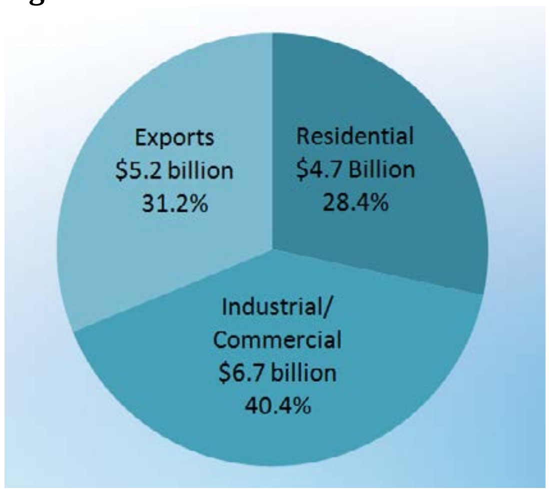
Figure 2.1: Major Electrical and Natural Gas Facilities



Manitoba Hydro's ongoing operations and future projects represent a major contributing factor to the provincial economy, translating to employment and business opportunities for thousands, especially in the northern regions where much of the new development is taking place.

In addition to providing electricity to Manitobans, Manitoba Hydro exports surplus electricity to utilities within three wholesale markets in the Midwestern U.S. and Canada. In the last decade, export sales have contributed $5.2 billion in revenues to Manitoba Hydro. These revenues are used to keep rates low for Manitobans.

Figure 2.2: Share of Total Electric Revenue 2005-2014



2.1.2 Corporate Strategic Plan

Manitoba Hydro's Corporate Strategic Plan ("CSP") is summarized in the following figure and sets out the Corporation's vision and mission, and outlines key objectives focused on meeting Manitobans' long-term energy needs and achieving operational excellence in electric and gas operations.

Figure 2.3: Manitoba Hydro Vision, Mission and Key Areas of Focus

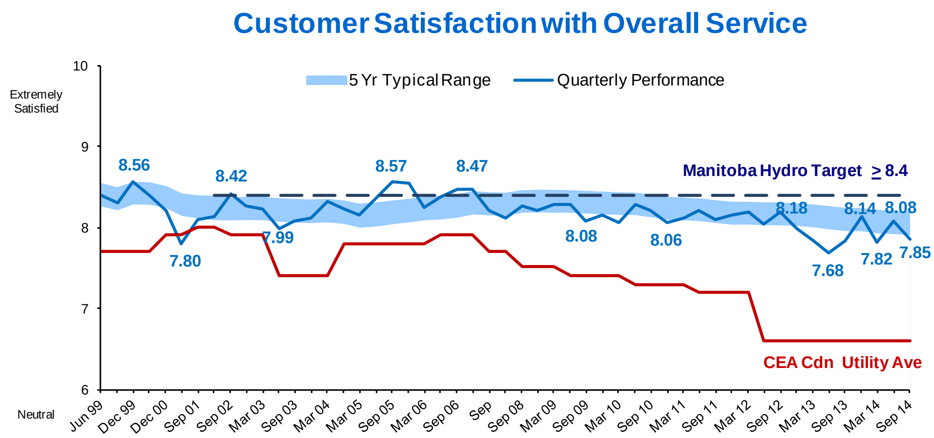
A full copy of Manitoba Hydro's current CSP is provided as Appendix 2.1 to this Tab.

Using the CSP as a guide, Manitoba Hydro's business units develop supporting business objectives that establish priorities, and outline strategies and measures designed to contribute towards achieving overall corporate objectives. To accomplish these objectives, Manitoba Hydro is organized into 10 business units. A description of each Business Unit and Manitoba Hydro's current Organizational Chart is provided in Appendix 2.2.

2.1.3 Manitoba Hydro is a Leader in Customer Satisfaction

An industry leader in customer satisfaction, Manitoba Hydro is committed to providing high system reliability, excellent customer service and affordable rates. Manitoba Hydro continues to receive satisfaction ratings for customer service, corporate citizenship and corporate image components that are consistently higher than the national average for Canadian electric utilities. Manitoba Hydro's customer satisfaction results compared to the CEA Canadian Average are shown in the following figure.

Figure 2.4: Customer Satisfaction with Overall Service



2.1.4 Manitoba Hydro Provides High System Reliability

Electricity is essential to the lives and livelihoods of Manitobans and is a contributor to the prosperity of Manitoba's economy. The investment in electric infrastructure that Manitoba Hydro has made over decades has resulted in one of the most reliable, sustainable and affordable power systems in Canada. The following figures show that Manitoba Hydro has historically been in the first quartile of CEA member utilities as it relates to the System Average Interruption Frequency Index ("SAIFI") and the System Average Interruption Duration Index ("SAIDI") reliability indicators, on a calendar year basis. The SAIFI indicator measures the average number of interruptions that a customer has experienced, and the SAIDI indicator measures the average outage duration experienced by customers.

Figure 2.5: Manitoba Hydro SAIFI Indicator Compared to CEA Member Utilities

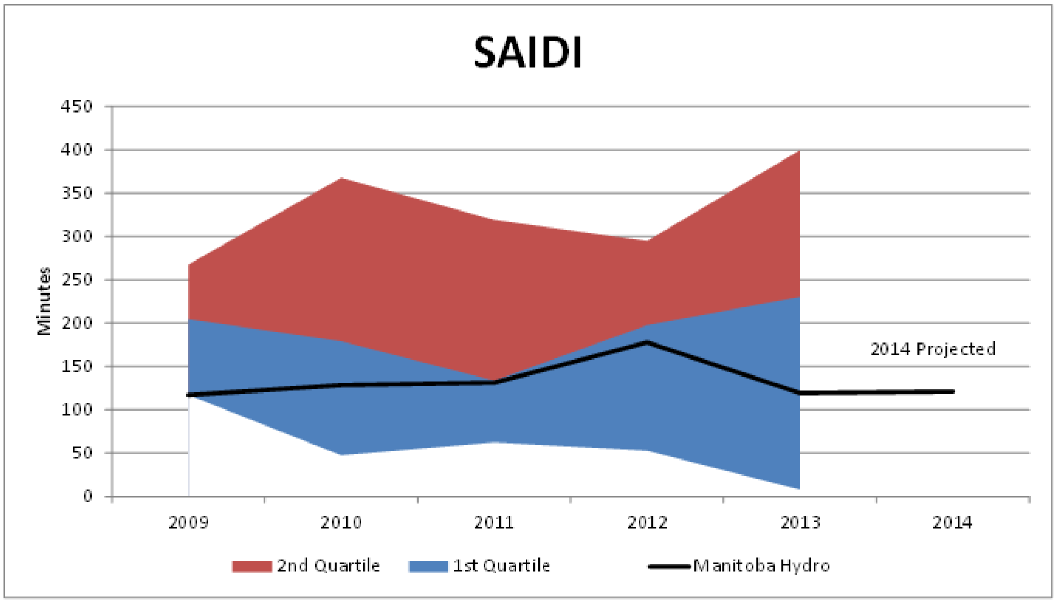


Figure 2.6: Manitoba Hydro SAIDI Indicator Compared to CEA Member Utilities

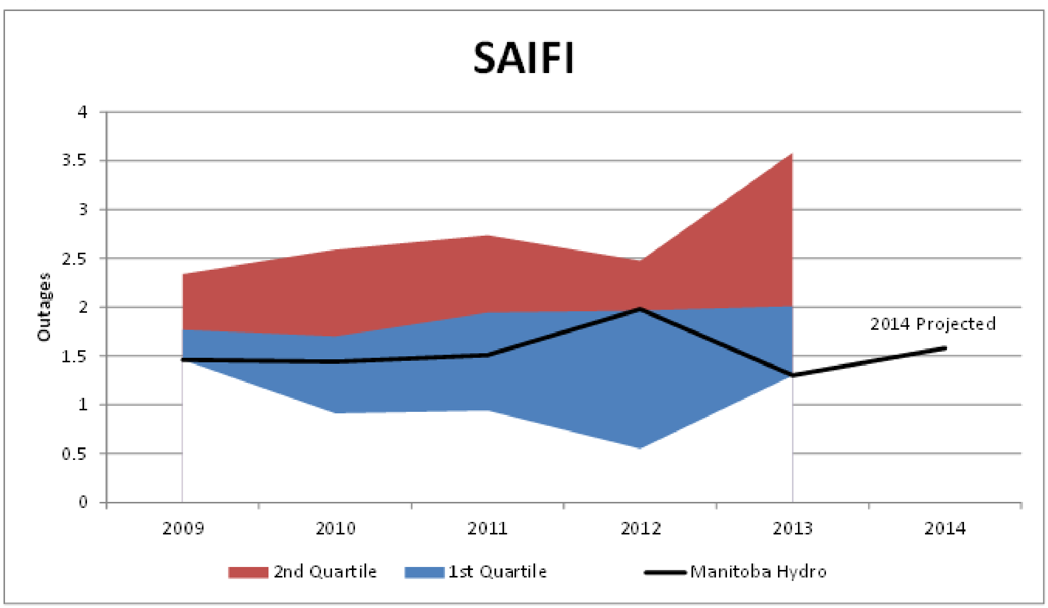
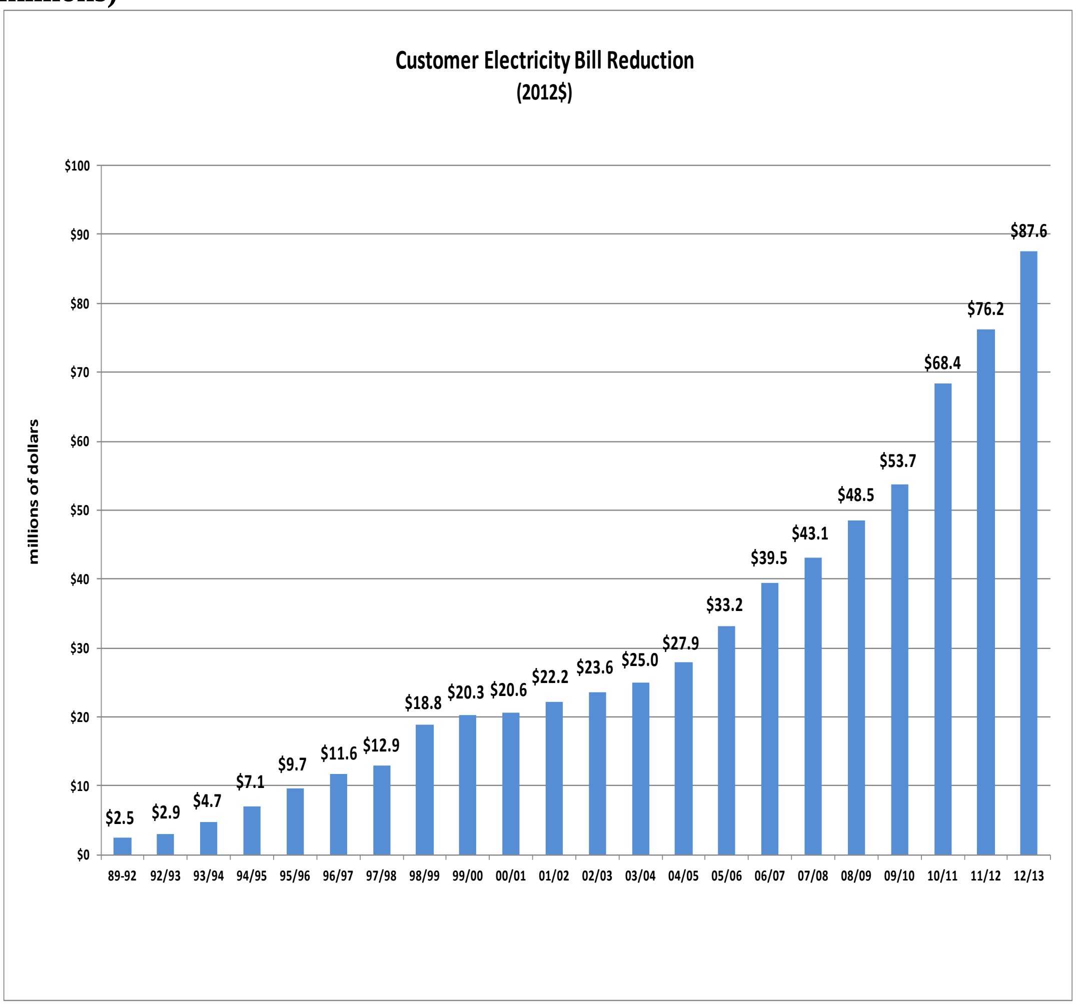


2.1.5 Manitoba Hydro is a Leader in Offering Power Smart Programs

Manitoba Hydro's Power Smart Programs have been and continue to be very successful at reducing customers' energy bills while contributing to a sustainable energy supply in Manitoba. As demonstrated in the following figure, Power Smart electrical savings translate into a growing annual reduction in customer electricity bills with a total of $660 million cumulative reduction to 2012/13. In addition, Power Smart has led to reductions in indirect greenhouse gas emission reductions of approximately 1,532,000 tonnes of carbon dioxide equivalent emissions in 2012/13.

Figure 2.7: Annual Power Smart Savings—Customer Electricity Bill Reduction ($ millions)

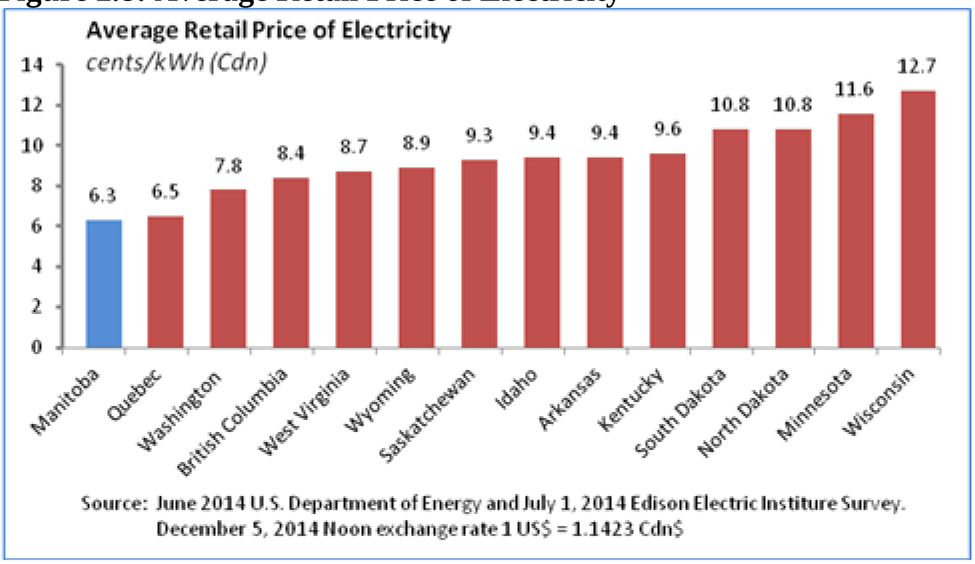


2.1.6 Manitoba Hydro Offers Affordable and Competitive Rates to Customers

Manitoba Hydro's domestic electric rates are affordable for Manitoba families and support the competitiveness of Manitoba businesses. The following figure shows

Manitoba Hydro's current weighted-average retail electricity price for all customer classes (as compared to other low-cost jurisdictions and neighbouring utilities), and demonstrates that Manitoba Hydro has among the lowest average retail electricity rates in North America.

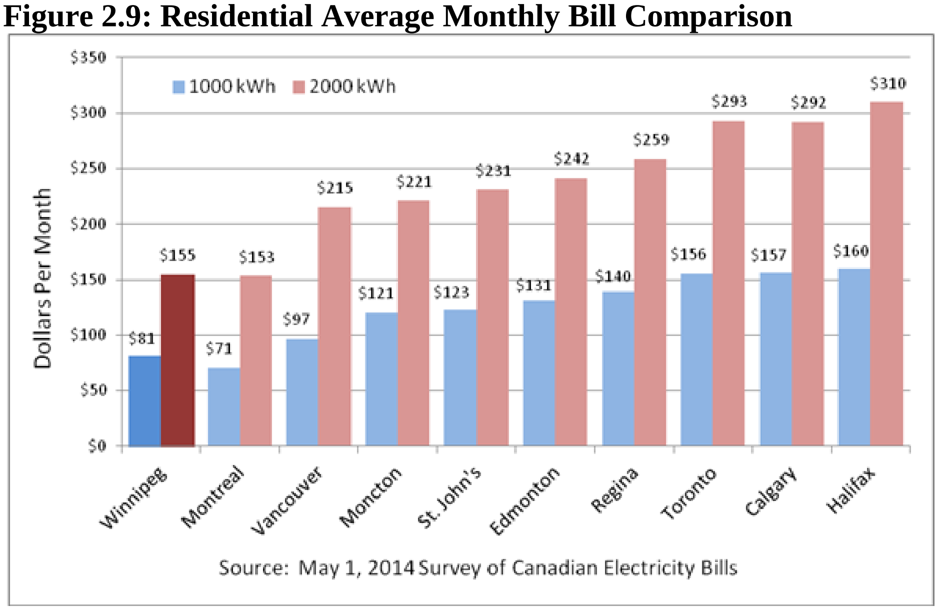
Figure 2.8: Average Retail Price of Electricity



Source: June 2014 U.S. Department of Energy and July 1, 2014 Edison Electric Institute Survey.
December 5, 2014 Noon exchange rate 1 US$ = 1.1423 Cdn$

As is demonstrated in the following figure, Manitoba enjoys a distinct advantage over most of the Canadian jurisdictions with respect to the average monthly bills of residential customers.

Figure 2.9: Residential Average Monthly Bill Comparison



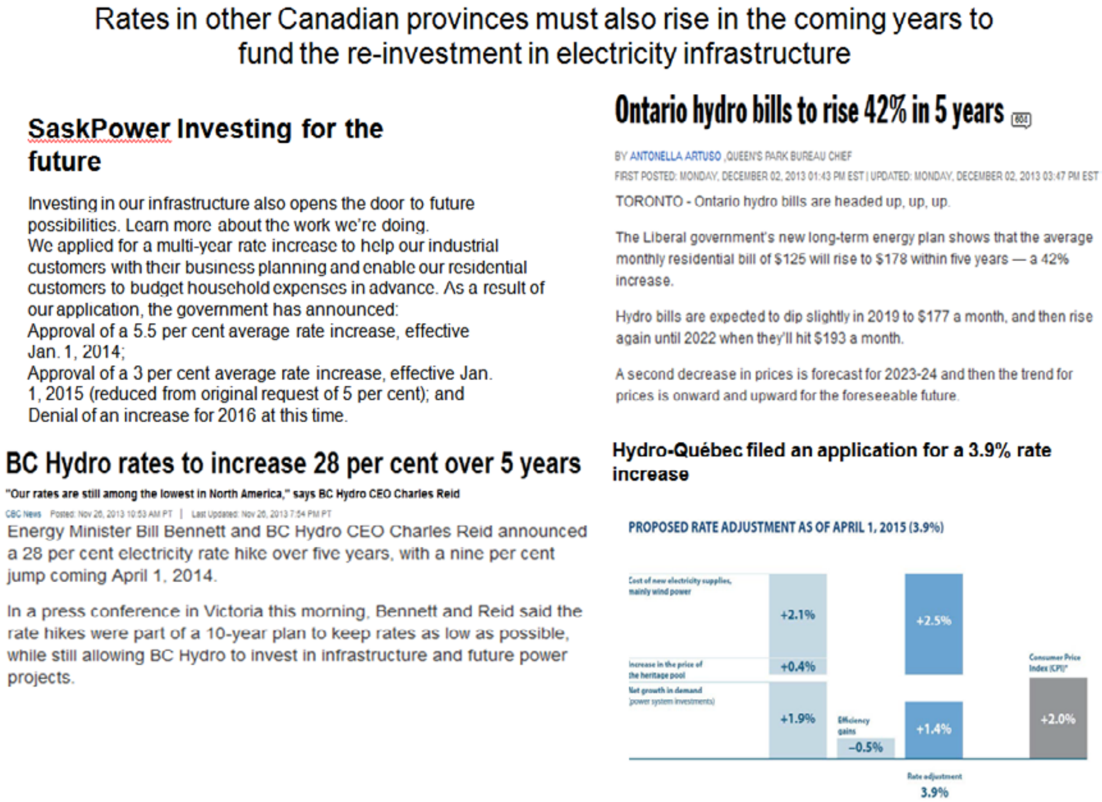
Source: May 1, 2014 Survey of Canadian Electricity Bills

The April 1, 2015 rate increase, if approved, would result in a modest $3.20 increase in the monthly bill of a residential customer without electric space heat using 1,000 kilowatt-hours (“kWh”) per month, and a $6.11 increase in the monthly bill for a residential customer with electric space heat using 2,000 kWh per month.
The April 1, 2016 rate increases, if approved, would result in an additional $3.33 increase in the monthly bill of a residential customer without electric space heat and an additional $6.36 increase in the monthly bill for a residential customer using electricity for space heat.

It is recognized that other Canadian utilities are also encountering the need to replace and refurbish aging utility assets, which will place upward pressure on electricity rates across most jurisdictions in the coming years. As can be seen in the following charts, Manitoba Hydro is not alone in needing to address the required investment in its electrical system through higher rate increases.

Figure 2.10: Required Investment in Canada’s Electricity System 2011-2030

Figure 2.11: Proposed Rate Increases in Other Jurisdictions



Rates in other Canadian provinces must also rise in the coming years to fund the re-investment in electricity infrastructure

SaskPower Investing for the future

Investing in our infrastructure also opens the door to future possibilities. Learn more about the work we're doing.
We applied for a multi-year rate increase to help our industrial customers with their business planning and enable our residential customers to budget household expenses in advance. As a result of our application, the government has announced:
Approval of a 5.5 per cent average rate increase, effective Jan. 1, 2014;
Approval of a 3 per cent average rate increase, effective Jan. 1, 2015 (reduced from original request of 5 per cent); and
Denial of an increase for 2016 at this time.

BC Hydro rates to increase 28 per cent over 5 years

"Our rates are still among the lowest in North America," says BC Hydro CEO Charles Reid

CBC News Posted: Nov 26, 2013 10:53 AM PT | Last Updated: Nov 26, 2013 7:54 PM PT

Energy Minister Bill Bennett and BC Hydro CEO Charles Reid announced a 28 per cent electricity rate hike over five years, with a nine per cent jump coming April 1, 2014.

In a press conference in Victoria this morning, Bennett and Reid said the rate hikes were part of a 10-year plan to keep rates as low as possible, while still allowing BC Hydro to invest in infrastructure and future power projects.

Ontario hydro bills to rise 42% in 5 years

BY ANTONELLA ARTUSO, QUEEN'S PARK BUREAU CHIEF
FIRST POSTED: MONDAY, DECEMBER 02, 2013 01:43 PM EST | UPDATED: MONDAY, DECEMBER 02, 2013 03:47 PM EST

TORONTO - Ontario hydro bills are headed up, up, up.

The Liberal government's new long-term energy plan shows that the average monthly residential bill of $125 will rise to $178 within five years — a 42% increase.

Hydro bills are expected to dip slightly in 2019 to $177 a month, and then rise again until 2022 when they'll hit $193 a month.

A second decrease in prices is forecast for 2023-24 and then the trend for prices is onward and upward for the foreseeable future.

Hydro-Québec filed an application for a 3.9% rate increase

While Manitoba Hydro will be required to gradually increase rates to pay for its increased investment in generation, transmission and distribution infrastructure, the electrical rate advantage enjoyed by energy consumers in Manitoba over those in most other jurisdictions is expected to continue.

2.2 MANITOBA HYDRO'S CAPITAL INVESTMENT DRIVERS & BORROWING REQUIREMENTS

2.2.1 Manitoba Hydro is Entering a Period of Extensive Capital Investment

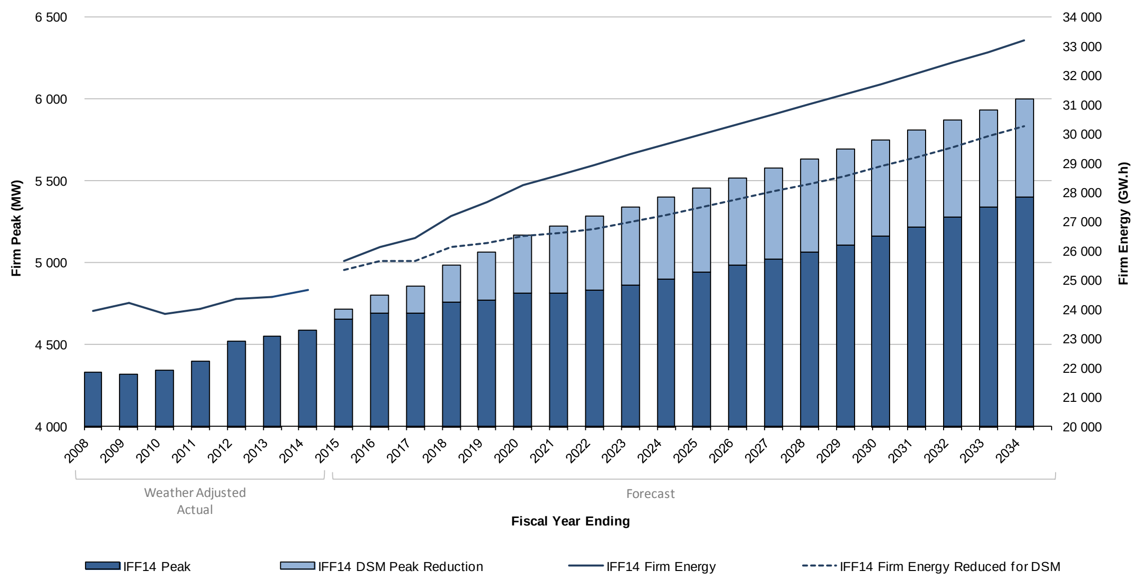
The provision of electric service is inherently a capital intensive business which requires a substantial investment in generating stations, transmission lines, distribution facilities and supporting infrastructure. Another characteristic of an electric utility is that the investments in major projects are large and lumpy and tend to have a significant impact on revenue requirements when they are first placed into service. In order to provide safe and reliable service to customers, Manitoba Hydro is continuously investing in assets.

Manitoba Hydro is entering a period of extensive investment and re-investment in its infrastructure in order to meet the growing energy needs of Manitoba, to replace aging utility assets that are approaching the end of their service lives, and to address capacity constraints on its existing system. The required infrastructure investment costs will be many multiples higher than the historic cost of the existing asset base.

Manitoba Hydro is also committed to significantly higher levels of investment in Demand Side Management ("DSM") programs on behalf of customers. Manitoba Hydro's Power Smart Programs play a key role in meeting Manitoba's future energy needs in a sustainable manner and assisting customers in reducing their energy bills by using energy more efficiently.

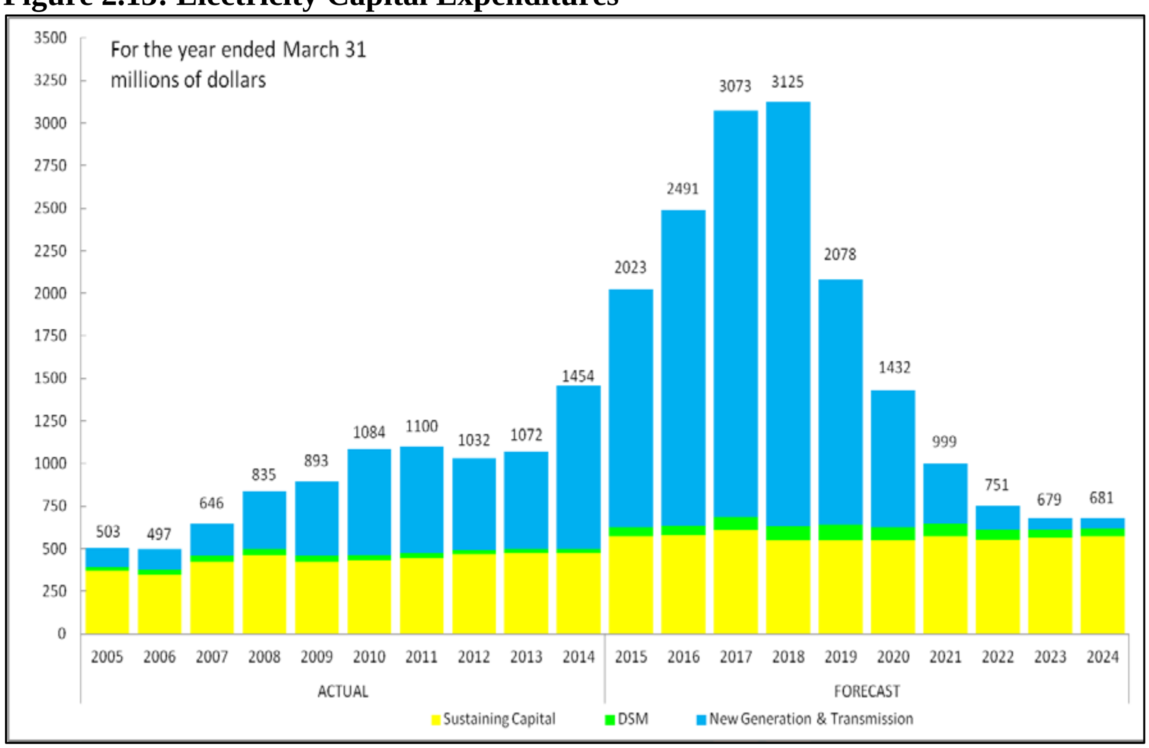
Even with load reductions from Power Smart initiatives, the demand for electricity in Manitoba is continuing to grow as a result of increases in population, higher average energy usage, and industrial and commercial customer expansion. The following figure shows the actual and forecast growth in Manitoba Hydro's load, as well as the forecasted impact of the Power Smart Plan.

Figure 2.12: Forecast Load Growth Before and After Impact of DSM



The required investment in new and replacement assets, as well as DSM programs, will result in significantly higher capital expenditures over the next 10 year period, as demonstrated by the following figure.

Figure 2.13: Electricity Capital Expenditures

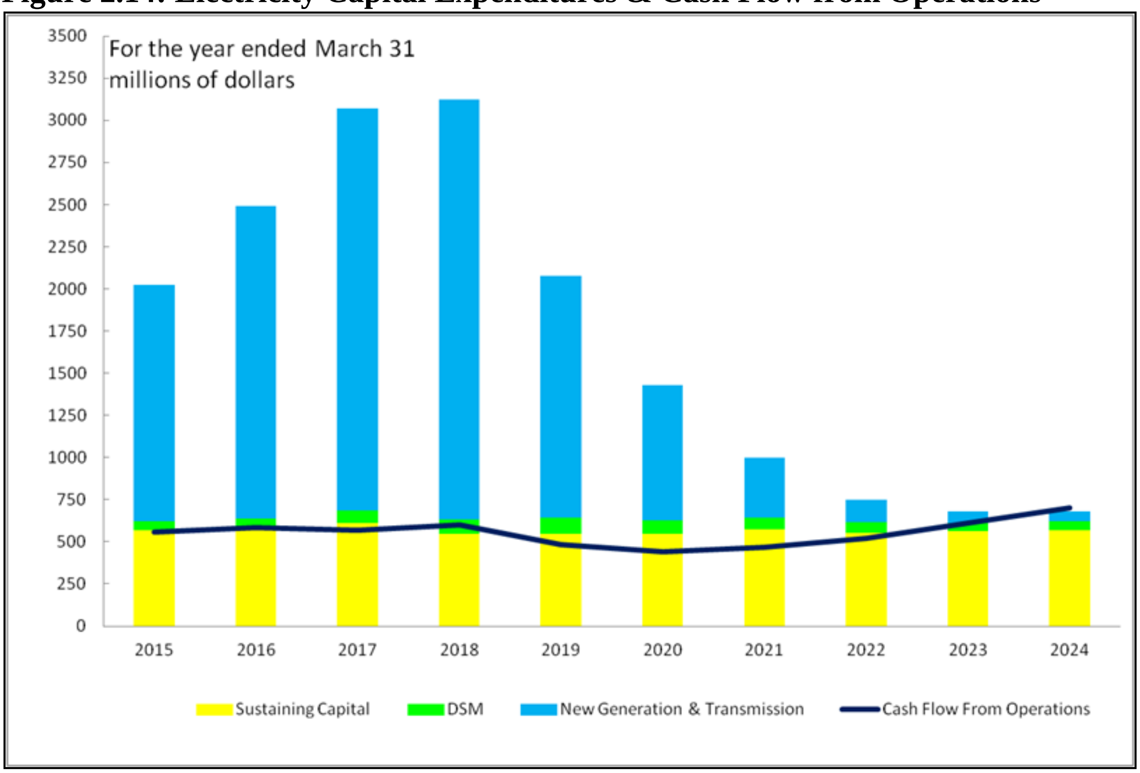


2.2.2 Investment Requirements will Lead to Unprecedented Levels of Debt Financing

Unlike private utilities, Manitoba Hydro does not have access to share capital as a source of funds and must rely on a combination of internally generated cash from operations and debt financing in order to fund its capital investment program.

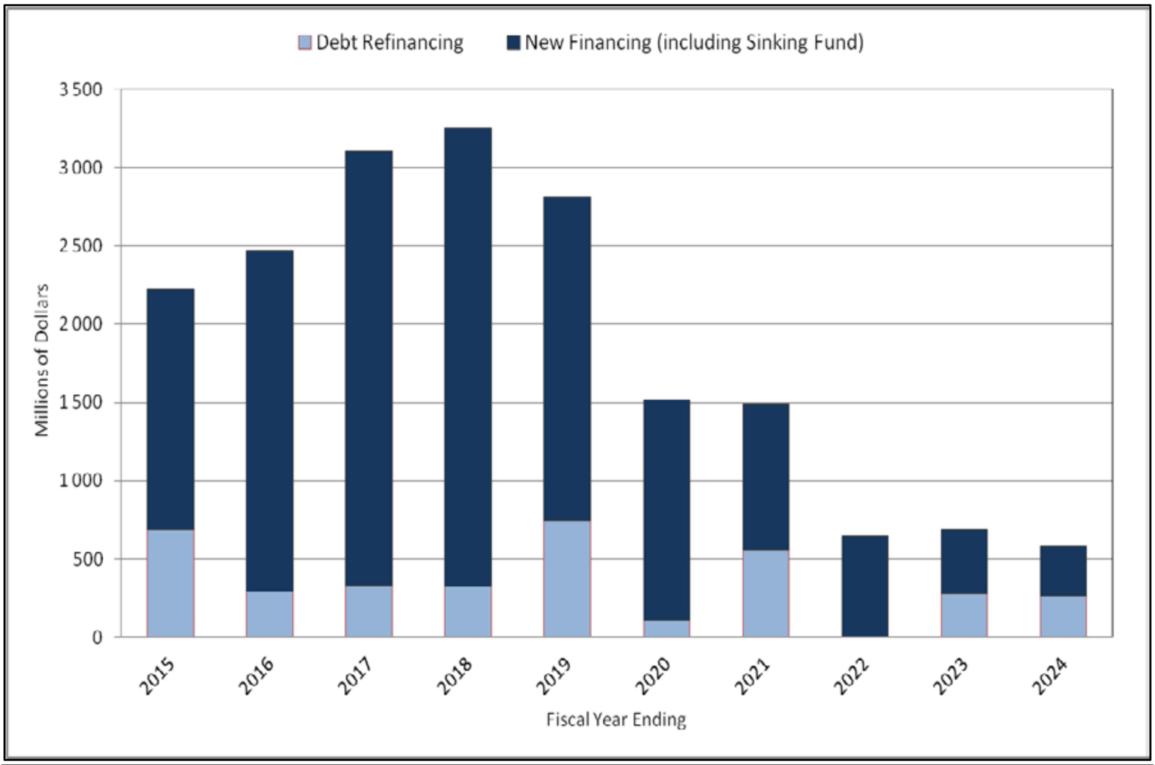
The following figure depicts the capital investment requirements for the next 10 years along with the forecasted cash-flow from operations, including the proposed and indicative 3.95% rate increases. Manitoba Hydro has historically targeted to fund sustaining capital expenditures with cash flow from operations. This chart indicates that the cash that is projected to be generated from operations is just sufficient in 4 of the 10 years to fund sustaining capital expenditures. From 2019 to 2022, Manitoba Hydro is projecting that it will be required to borrow funds to finance sustaining capital expenditures.

Figure 2.14: Electricity Capital Expenditures & Cash Flow from Operations



The implications of the above-noted figure is that Manitoba Hydro is forecasting that in the next 10 years it will fund the vast majority of new major generation and transmission capital expenditures through debt financing. When combined with debt refinancing requirements, the total debt requirements for Manitoba Hydro's electric operations in the next five-year period will peak at levels in excess of $3 billion per year, as illustrated in the following figure. These total forecast debt requirements are unprecedented in Manitoba Hydro's history.

Figure 2.15: Projected Electric Operations Borrowing Requirements



The proposed and indicative rate increases are necessary to stabilize Manitoba Hydro's cash flow from operations to the minimum level to fund the majority of sustaining capital expenditures thereby avoiding: higher levels of debt; higher cash flow requirements to pay the interest on the incremental debt; higher interest expense; and higher customer rates, all to the benefit of the customer.

2.3 THE COMPELLING NEED FOR RATE INCREASES

In the previous section, Manitoba Hydro described the business requirements that are driving the need for investments in assets to allow the Corporation to continue to provide safe and reliable service to customers. In this section, Manitoba Hydro will describe how these same investments will impact revenue requirements and necessitate the requested rate increases.

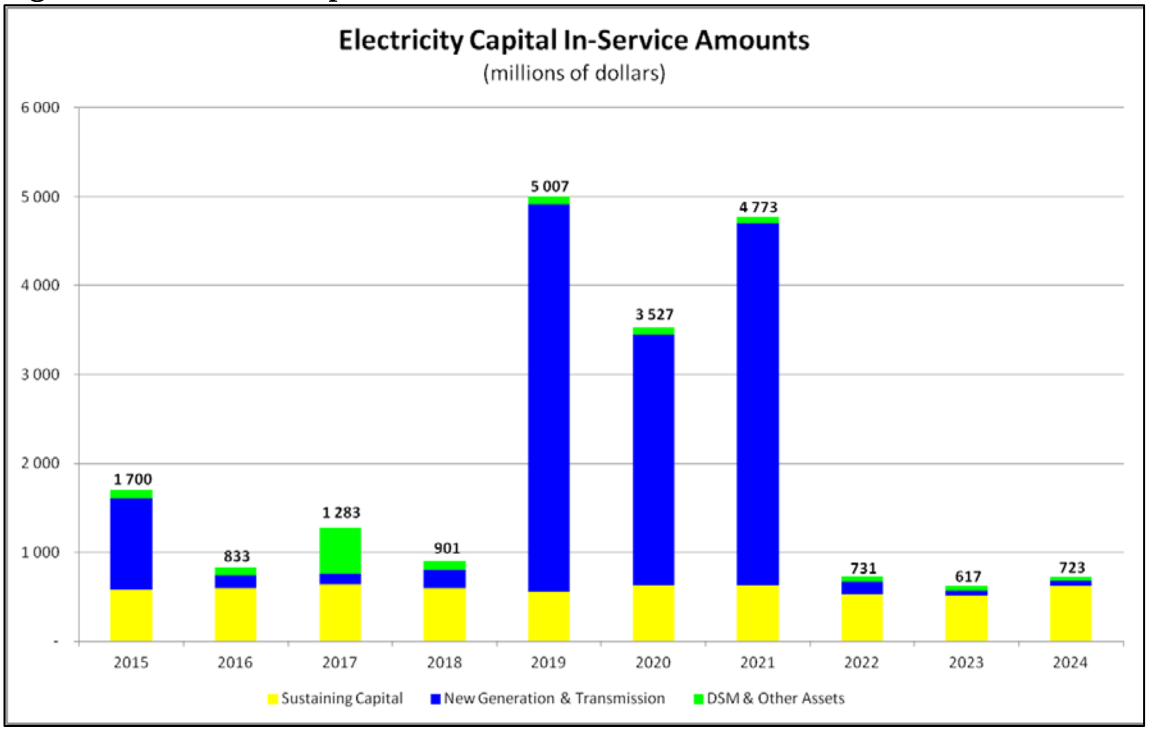
2.3.1 Revenue Requirements are Driven by Assets Being Placed into Service

As a result of the capital intensive nature of Manitoba Hydro's business, a significant portion of the overall revenue requirement of the Corporation is made up of carrying costs (finance expense, depreciation, and capital taxes) of the assets that are utilized to provide service to customers, along with the operating and maintenance costs of these assets. While assets are under construction, the capital expenditures and associated financing costs are held in construction work in progress. Once these assets are placed into service, the associated carrying costs form part of the Corporation's revenue requirements.

As is demonstrated in the Figure 2.16, the annual amount of assets that are forecast to be placed in service for electric operations will range between $0.6 billion and $5.0 billion over the next 10 year period. In the three year period for which rates are being reviewed as part of this Application (2015-2017), it is forecast that $3.8 billion of assets will be placed into service or commence amortization. The most significant assets being placed in-service during this period include the Pointe du Bois spillway replacement, and the Riel 230/500kV Station in 2015. In this three year period, there is also approximately $1.8 billion of sustaining capital expenditures that will be placed into service, and $0.2 billion of DSM expenditures that will commence amortization.

Over the 10 year period between 2015 to 2024, it is projected that $20.1 billion of assets will be placed into service related to electric operations, the most significant of which are the Bipole III Reliability Project ($4.6 billion) and the Keeyask Generating Station ($6.5 billion). In this 10 year period, it is projected that approximately $5.9 billion of sustaining capital expenditures will be placed into service, $0.7 billion of DSM expenditures will commence amortization and $0.4 billion of deferred Conawapa costs will commence amortization.

Figure 2.16: Electric Capital In-Service 2015-2024

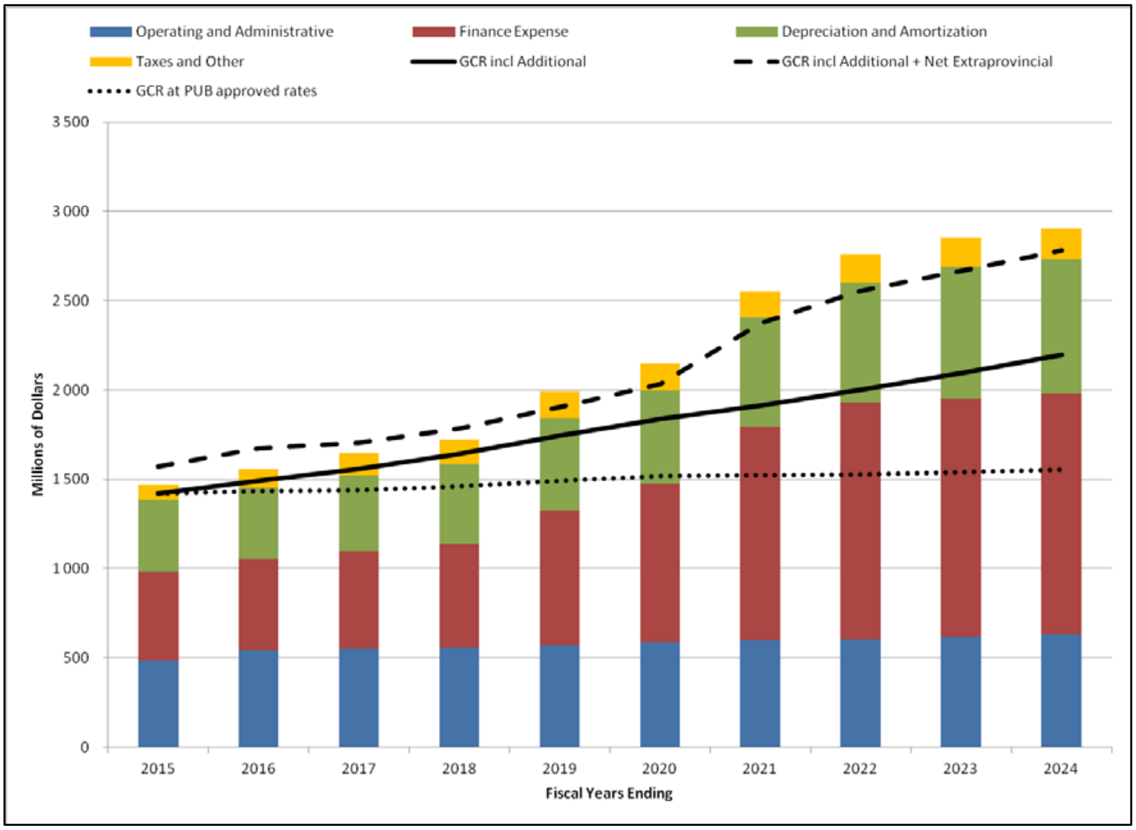


2.3.2 Carrying Costs on Electric Assets are Expected to Double in Next 10 Years

The required investment in new and existing infrastructure is expected to double the asset base and associated carrying costs of electric operations in the next 10 years.

The graph below provides a depiction of the increase in the costs for electric operations over the next 10 year period compared to the revenues that are projected to be generated from domestic and export customers.

Figure 2.17: Electric Expenses Compared to Revenues



The bars in Figure 2.17 provide the projected operating & administrative expense (blue bar), finance expense (red bar), depreciation & amortization expense (green bar), and taxes and other costs (orange bar) for the next 10 year period. Over that period, the total costs of the electric operations are projected to increase from the current level of approximately $1.5 billion to nearly $3.0 billion. The increase in costs in the years that are under review in this Application (2015-2017), and in the next 10 years are primarily related to increases in finance expense and depreciation as a result of the assets that are coming into service. Operating, maintenance and administrative costs are relatively constant throughout this period and do not materially contribute to the $1.5 billion increase in electric costs.

The dotted line in the Figure 2.17 represents domestic general consumers' revenue (GCR) at current PUB approved rates and the solid line represents GCR including the proposed and indicative rate increases of 3.95% per year to 2023/24. The dashed line in the graph represents the total of GCR at the proposed rates including rate increases and net extra-provincial revenues (extra-provincial revenues net of water rentals and fuel and power purchased).

Even with the proposed and indicative rate increases, Manitoba Hydro is projecting losses on electric operations in 2018/19 to 2023/24 totaling approximately $900 million as forecast domestic and export revenues will not be sufficient to cover the increased costs.

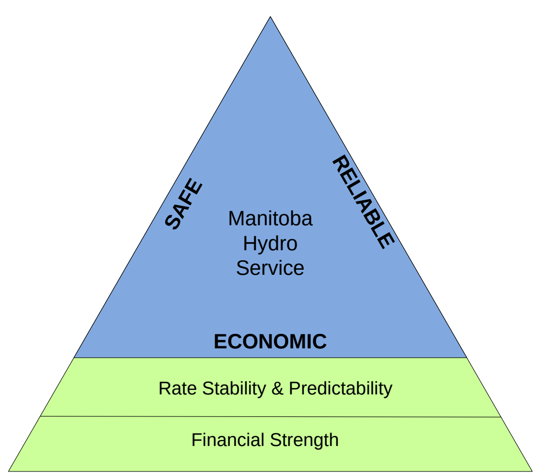
In the next 10 years there is significant financial risk and potential for rate volatility as Manitoba Hydro's financial position deteriorates due to the large investment requirements. In the longer term, the indicative 3.95% rate increases and export revenues generated from the Keeyask Generating Station are projected to accumulate to a sufficient level to cover the increased costs and Manitoba Hydro will begin to rebuild its financial reserves.

2.3.3 Rate Stability for Customers is Dependent on the Financial Strength of the Corporation

In order to ensure rate stability and predictability for customers, it is necessary that Manitoba Hydro maintains its financial strength. In other words, if Manitoba Hydro does not receive the necessary rate increases to maintain its financial strength, then there is significant risk to customers that rate changes will become more volatile and there will be a need for sudden or larger rate increases in the near future. This risk is particularly acute in the upcoming period of extensive capital investment and reinvestment.

Manitoba Hydro's safe, reliable and economic service is based upon a solid foundation of financial strength which promotes rate stability and predictability for customers.

Figure 2.18: The Foundation of Safe, Reliable and Economic Service



2.3.4 Investments in Capital Assets Will Place Pressure on Manitoba Hydro's Financial Strength

The proposed and indicative rate increases are the minimum rate increases necessary to provide for the required investment in infrastructure to allow the Corporation to continue to provide safe and reliable service, and are essential to preserve the financial integrity of the Corporation in order to promote rate stability for customers.

Even with the proposed and indicative rate increases projected in MH14, retained earnings from electric operations are projected to fall from $2.7 billion in 2014/15 to $2.0 billion by 2023/24. This amount is barely sufficient to absorb the impact of the reoccurrence of a historic 5-year drought, and does not provide sufficient reserves to mitigate the potential financial impacts of the considerable array of risks the Corporation faces in fulfilling its mandate.

Manitoba Hydro's equity ratio for electric operations is projected to deteriorate from the current level of 23% to 10% by 2022/23 as a result of the increase in carrying costs and levels of debt associated with the extensive investment in infrastructure, combined with the reduction of revenues primarily as a result of increased DSM savings.

With the proposed and indicative 3.95% rate increases, Manitoba Hydro's interest coverage ratio is also forecast to be well below target for several years of the forecast. In six years of the 10 year forecast, Manitoba Hydro's interest coverage ratio is projected to be below 1.0, which indicates that the utility would experience elevated operational liquidity risk and may have difficulty generating sufficient revenues and cash flow from operations to pay its interest obligations.

Similarly, the capital coverage ratio is below target for several years as a result of lower net earnings and the increase in capital requirements for the renewal and replacement of aging infrastructure. Manitoba Hydro has historically funded sustaining capital expenditures through internally generated funds; however, it is projecting capital coverage ratios below 1.0 in six years of the 10 year forecast, which indicates that the utility will not generate sufficient revenues to fund its sustaining capital expenditures and must borrow in order to renew or replace existing infrastructure.

The following figures demonstrate the significance of the projected rate increases by comparing the net income, retained earnings, and financial ratios of electric operations including and excluding the proposed and indicative rate increases. As can be readily seen in the following figures the rate increases are vital to the continued financial strength of Manitoba Hydro.

Figure 2.19: Projected Net Income (2015-2024)

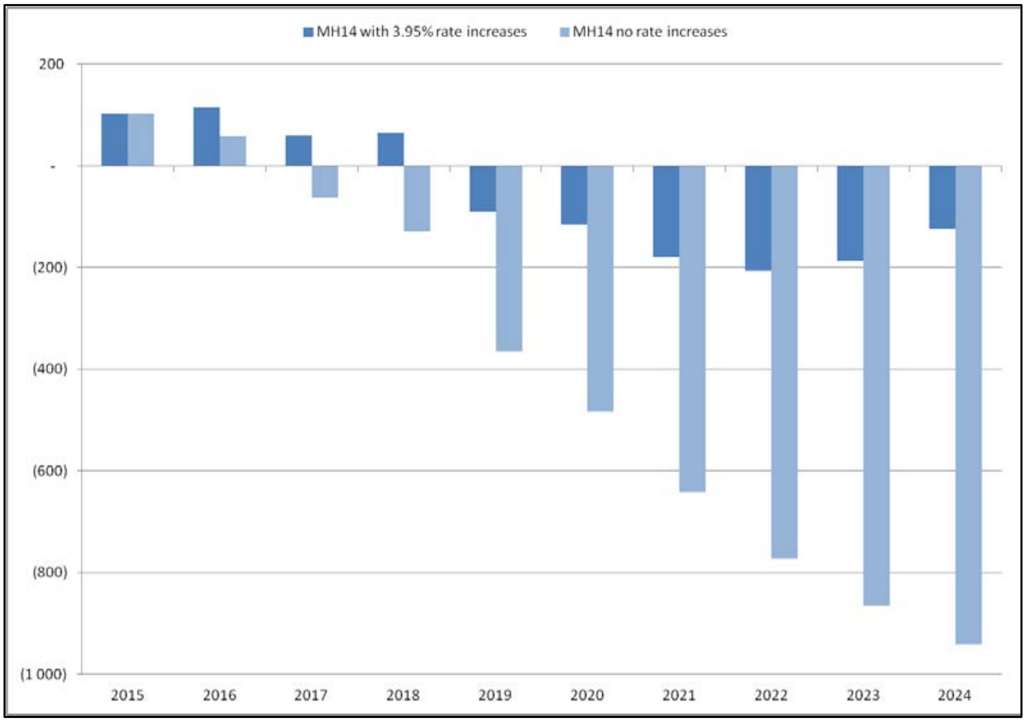


Figure 2.20: Projected Retained Earnings (2015-2024)

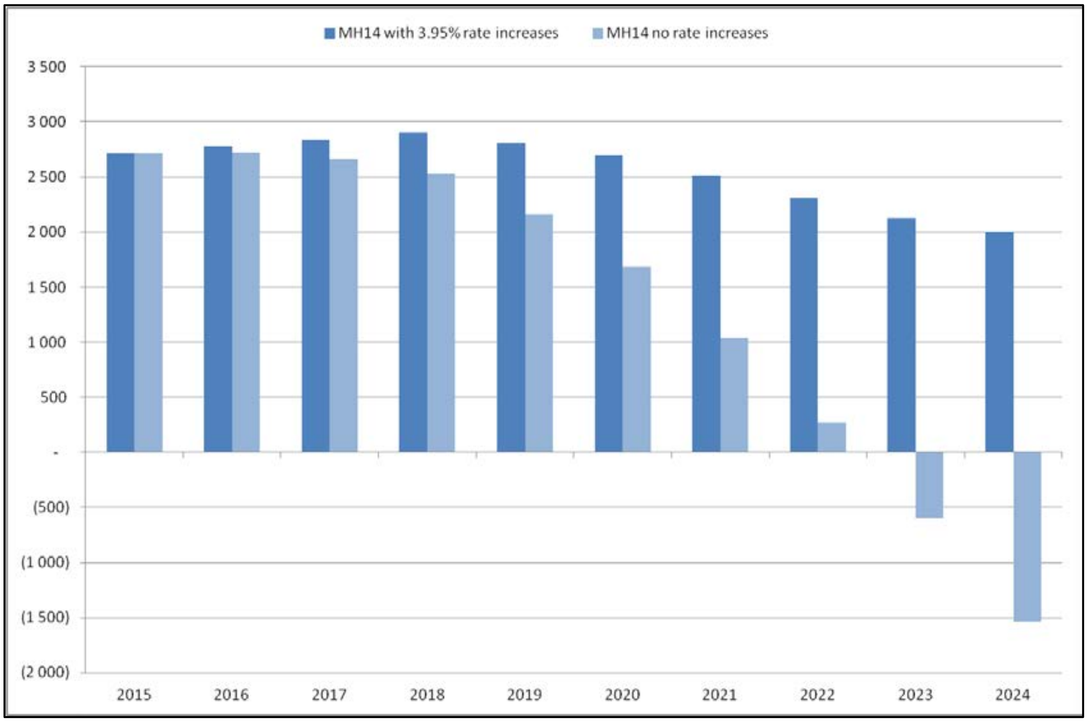

Figure 2.21: Projected Equity Ratio (2015-2024)

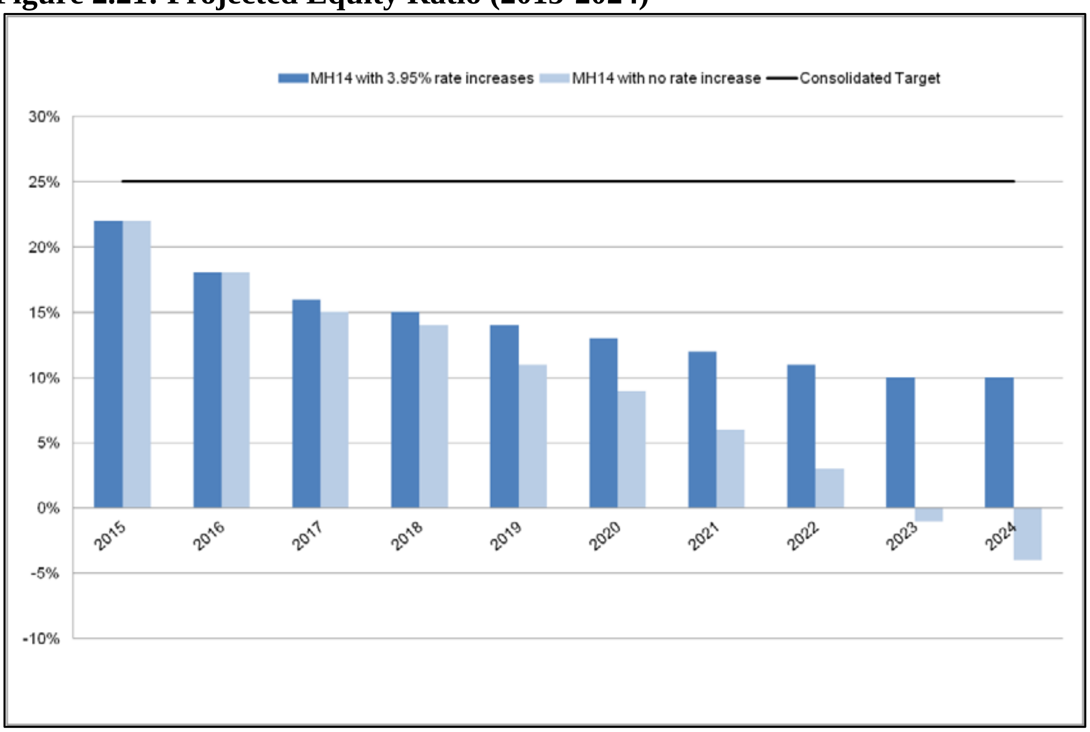

Figure 2.22: Projected Interest Coverage Ratio (2015-2024)

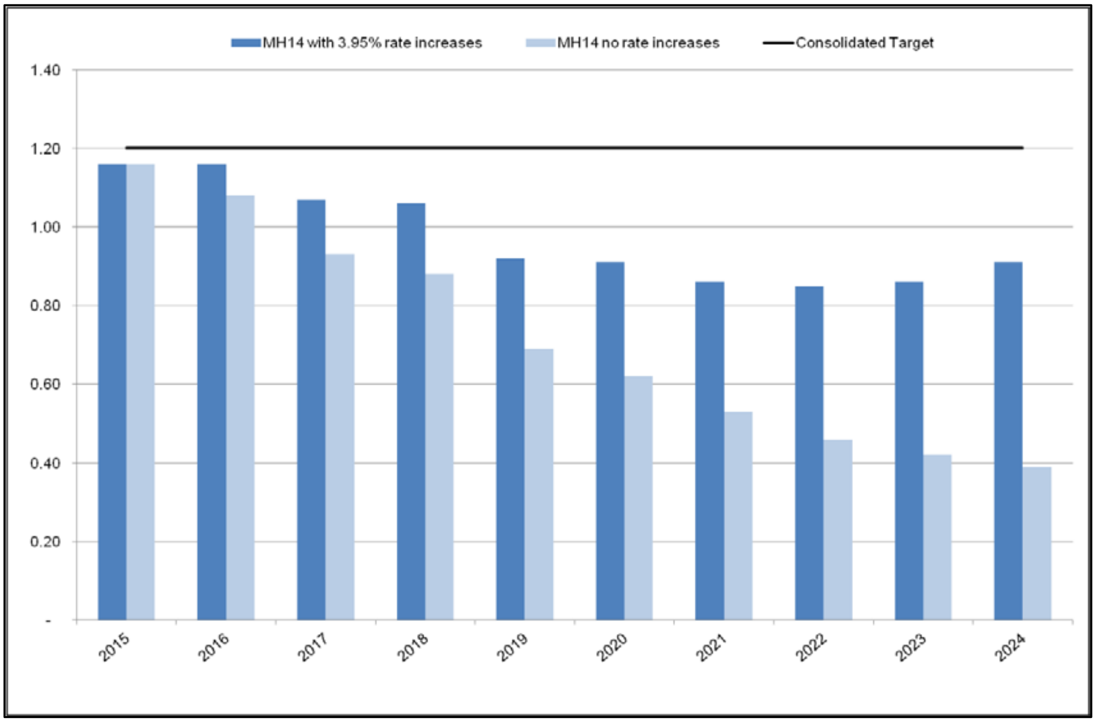

Figure 2.23: Projected Capital Coverage Ratio (2015-2024)

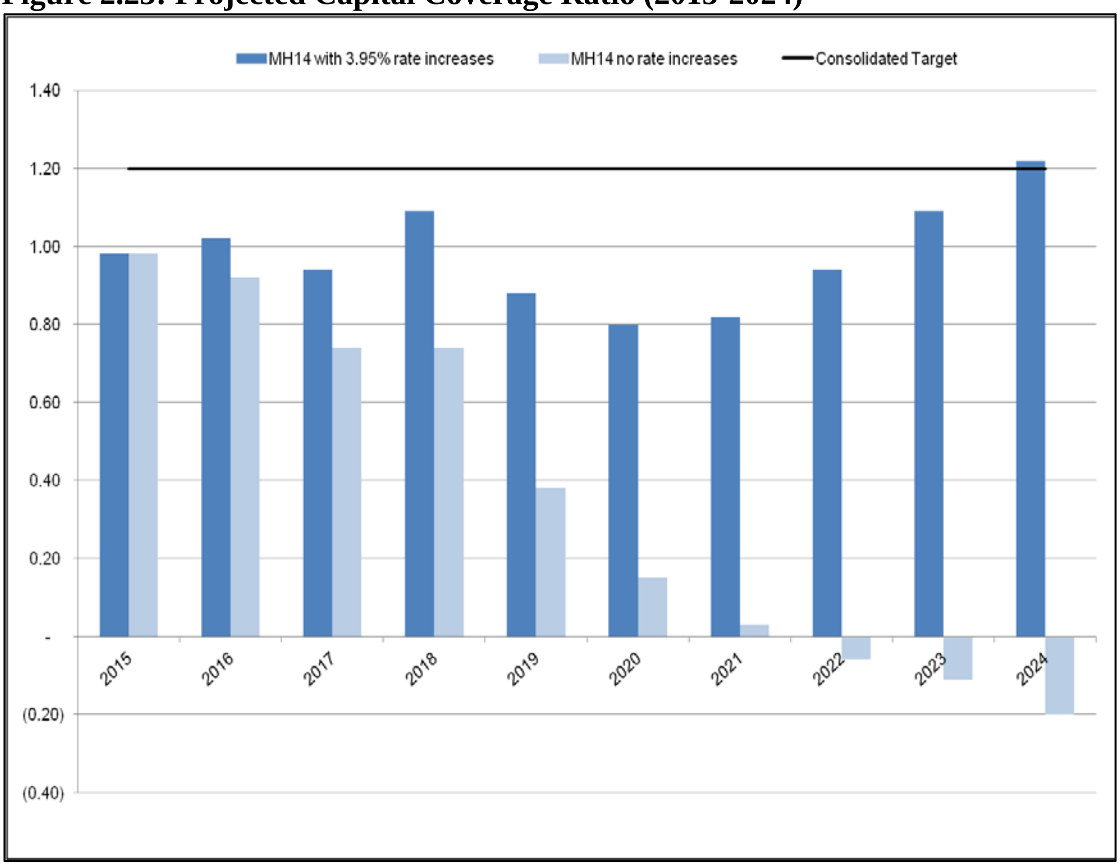
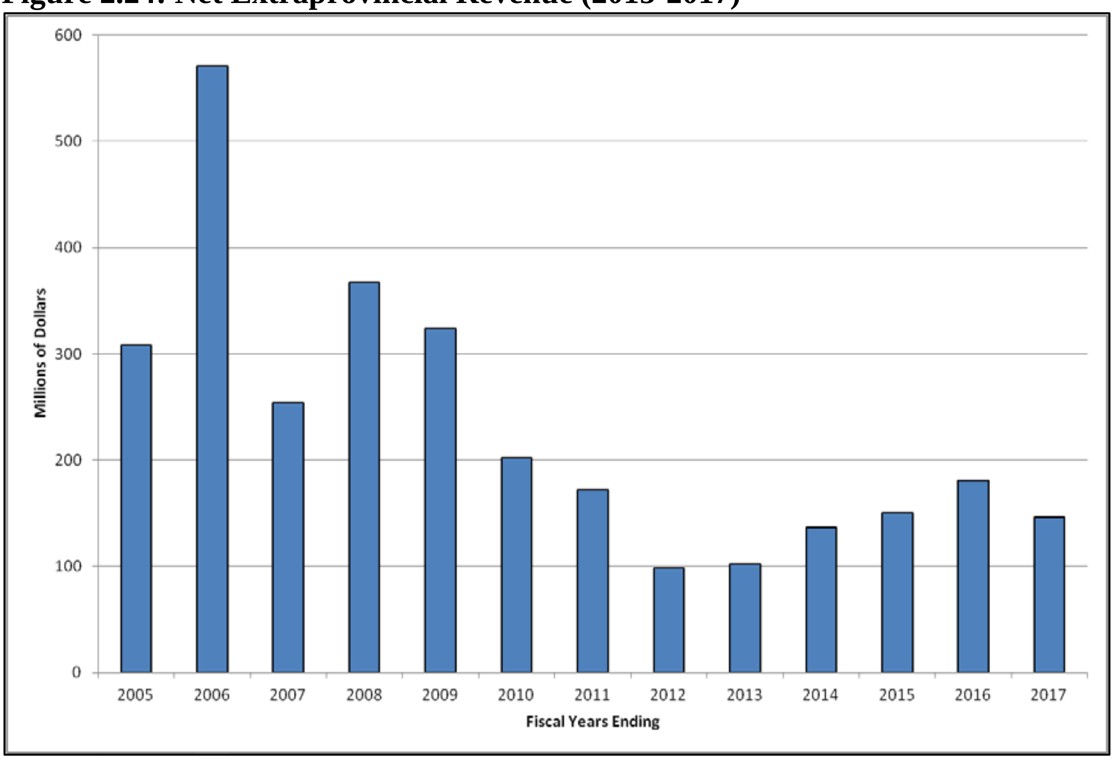


2.3.5 Rates Have Not Increased to Fully Compensate for Reductions in Net Extraprovincial Revenue

Historically, net extraprovincial revenues have made a significant contribution to overall revenues which has enabled Manitoba Hydro to maintain lower electricity rates for Manitobans.

As illustrated in Figure 2.24, net extraprovincial revenues have not been as strong as in previous years. Manitoba Hydro's net extraprovincial revenues are projected to be $150 million in 2014/15, $181 million in 2015/16 and $147 million in 2016/17, which is significantly lower than the average net extraprovincial revenues generated from 2004/05 to 2008/09 of approximately $365 million per year. It is necessary to gradually increase rates over time to compensate for the reduction in net extraprovincial revenues.

Figure 2.24: Net Extraprovincial Revenue (2015-2017)



*Actuals 2004/05 to 2013/14; forecast 2014/15 to 2016/17

2.3.6 Manitoba Hydro's 2015/16 & 2016/17 Rate Proposals Maintain Net Income and Financial Ratios at Acceptable Levels

Approval of the proposed rate increases in this Application are required to maintain net income and financial ratios for 2015/16 and 2016/17 at acceptable levels, and are necessary to promote rate stability for customers and ensure the financial integrity of the Corporation.

Figure 2.25 below summarizes the actual electric operations net income for the past two fiscal years and the projected net income for 2014/15, 2015/16, and 2016/17 from MH14.

Figure 2.25: Net Income from Electric Operations

Net Income - Electricity Operations

			Forecast		
(in millions of $)	**2013**	**2014**	**2015**	**2016**	**2017**
Revenue					
General Consumers Revenue					
- at approved rates	$ 1 341	$ 1 424	$ 1 437	$ 1 454	$ 1 460
- Bipole III Reserve	-	(19)	(30)	(32)	(34)
Extraprovincial Revenue (net of Fuel & Power Purchased and Water Rentals)	101	137	150	181	147

	1 472	1 564	1 572	1 617	1 587
Expenses	1 407	1 439	1 495	1 571	1 653
Operating, Maintenance and Administrative	463	481	486	542	552
Finance Expense	452	435	495	510	548
Depreciation and Amortization	392	411	405	401	422
Capital and Other Taxes	86	97	99	107	121
Corporate Allocation	9	9	9	8	8
Other expenses	5	6	2	2	2
Non-controlling Interest	13	22	25	12	8
Net Income (loss) before proposed rate increases	$ 78	$ 147	$ 102	$ 58	$ (58)
Proposed rate increases (3.95% April 1, 2015 and 3.95% April 1, 2016)				57	118
Net Income including proposed rate increases	$ 78	$ 147	$ 102	$ 115	$ 59

Retained Earnings and Financial Ratios (without proposed rate increases)

Retained Earnings (electric operations)	$ 2 468	$ 2 615	$ 2 717	$ 2 721	$ 2 663
Debt to Equity Ratio (electric operations)	75:25	77:23	78:22	82:18	85:15
Interest Coverage Ratio (electric operations)	1.13	1.25	1.16	1.08	0.93
Capital Coverage Ratio (electric operations)	1.26	1.39	0.98	0.92	0.74

Retained Earnings and Financial Ratios (including proposed rate increases)

Retained Earnings (electric operations)	$ 2 468	$ 2 615	$ 2 717	$ 2 778	$ 2 837
Debt to Equity Ratio (electric operations)	75:25	77:23	78:22	82:18	84:16
Interest Coverage Ratio (electric operations)	1.13	1.25	1.16	1.16	1.07
Capital Coverage Ratio (electric operations)	1.26	1.39	0.98	1.02	0.94

The proposed interim rate increase of 3.95% effective April 1, 2015 is expected to generate additional revenue of $57 million in 2015/16. With this increase, the forecast net income from Electric operations for 2015/16 is projected to be $115 million; the equity ratio is projected to be 18%; and the interest coverage and capital coverage ratios are projected at 1.16 and 1.02 respectively.

Absent the proposed rate increase for 2015/16, Manitoba Hydro is projecting net income of $58 million from Electric operations; the equity ratio is projected to be 18%; and the interest coverage and capital coverage ratios are projected to deteriorate to 1.08 and 0.92 respectively. Furthermore, without the proposed rate increase for 2015/16, Manitoba Hydro is projecting net income of only $2 million in 2016/17 even if it obtained a 3.95% increase effective on April 1, 2016. In this scenario, projected retained earnings are forecast to be $57 million and $115 million lower in 2015/16 and 2016/17 respectively.

The proposed rate increase of 3.95% effective April 1, 2016 is expected to generate additional revenue of $60 million in 2016/17. With this increase, the forecast net income from Electric operations is $59 million; the equity ratio is projected to be 16%; and, the capital coverage and interest coverage ratios are projected to be 1.07 and 0.94 respectively.

Without the proposed rate increase for 2016/17, Manitoba Hydro is projecting a net loss of $58 million; the equity ratio is projected to decline to 15%; and the interest coverage and capital coverage ratios are projected to further deteriorate to 0.93 and 0.74 respectively (well below the 1.20 target levels).

Considering the financial outlook as projected in MH14, there is financial justification for requesting rate increases in excess of 3.95%. Higher rate increases in the order of 5.5% to 6.0% for the next four years would be necessary to reduce the losses that are projected in the next 10 year period and maintain financial reserves at current levels. This would reduce the risk of the need for larger rate increases in the event of a significant drought or other adverse financial conditions.

Despite these risks, Manitoba Hydro has maintained the minimum proposed rate increases at the 3.95% level in consideration of customer sensitivity to rate increases.

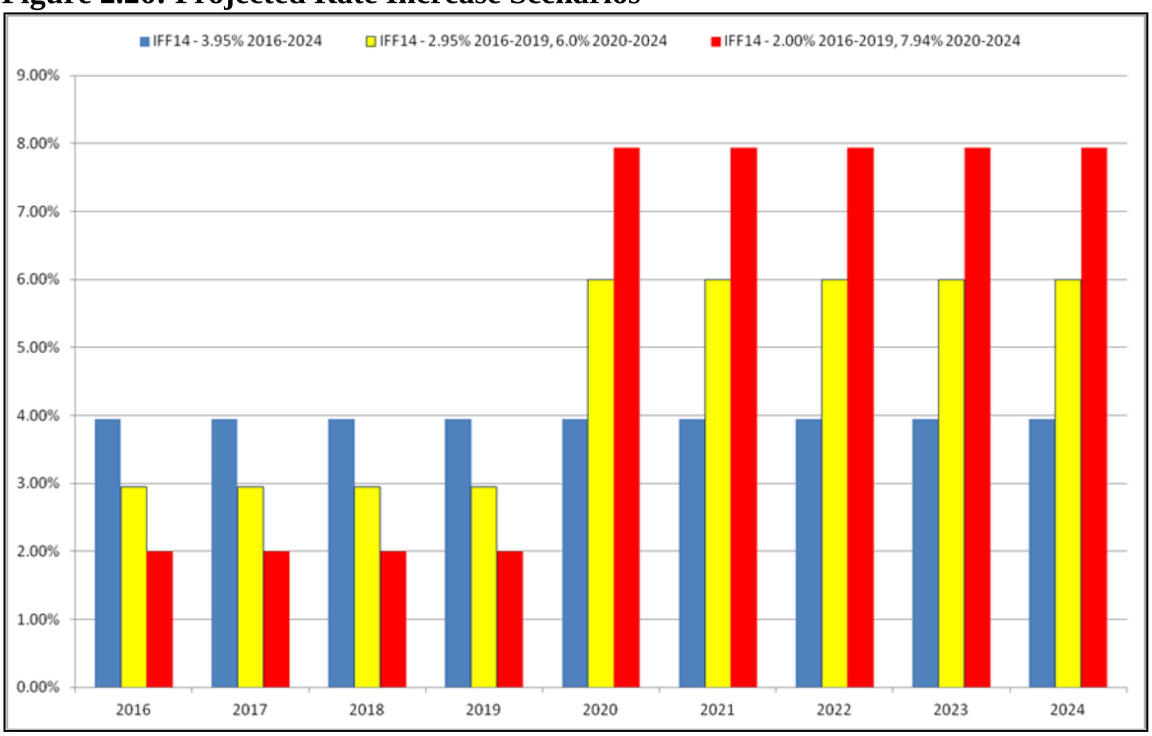
2.4 RISKS IF PROPOSED RATE INCREASES ARE NOT GRANTED

2.4.1 Increased Risk to Customers of Rate Instability and Rate Shock

To demonstrate the potential rate volatility of reducing the near term 3.95% indicative rate increases in MH14, Manitoba Hydro has prepared two scenarios that calculate the compensating rate increases that are required in the five year period from 2020 to 2024 if rate increases for the four year period from 2016 to 2019 were reduced to 2.95% or 2.0%, respectively.

The following figure demonstrates that with 2% rate increases for the next 4 years, Manitoba Hydro would require 8% rate increases for the following five years, and with 2.95% rate increases for the next four years, Manitoba Hydro would require 6% rate increases in the five years that follow. This analysis demonstrates how future rate increases would have to significantly increase in order to compensate for lower rate increases obtained in the near term.

Figure 2.26: Projected Rate Increase Scenarios



Given that these rate scenarios are also derived using average water flow assumptions and that adverse drought conditions may occur in the future, it is of vital importance that the rate increases be regular and occur even when there are short-term favorable water flow or financial conditions. In Manitoba Hydro's view, gradually raising rates by the minimum 3.95% rate increases is in the customer's best interest as this maintains customer rate stability and predictability, and reduces the risk of severe rate shock in the future.

2.4.2 Increased Risk to Customers of Decrease in Service & Reliability

A considerable portion of Manitoba Hydro's assets were installed when many of the first generating stations and transmissions lines were built (1911-1950) and a large portion of the province was electrified (1940-1960), and subsequently when generating stations and supporting HVDC systems were developed in Northern Manitoba (1960-1990). Historically, the reliability performance of Manitoba Hydro's electric assets has been excellent, and ratepayers in Manitoba have enjoyed the benefits of an affordable supply of safe and reliable electricity for many decades. However, many of Manitoba Hydro's generation, transmission and distribution assets have reached an age where their overall condition is such that system reliability has begun to degrade.

As shown in the following figures, Manitoba Hydro's reliability performance based on the SAIFI and SAIDI indicators show an increased trend of outage frequency and duration. Likewise, generation forced outage rates have increased significantly in the past four years.

Figure 2.27: Manitoba Hydro SAIDI and SAIFI Indictors

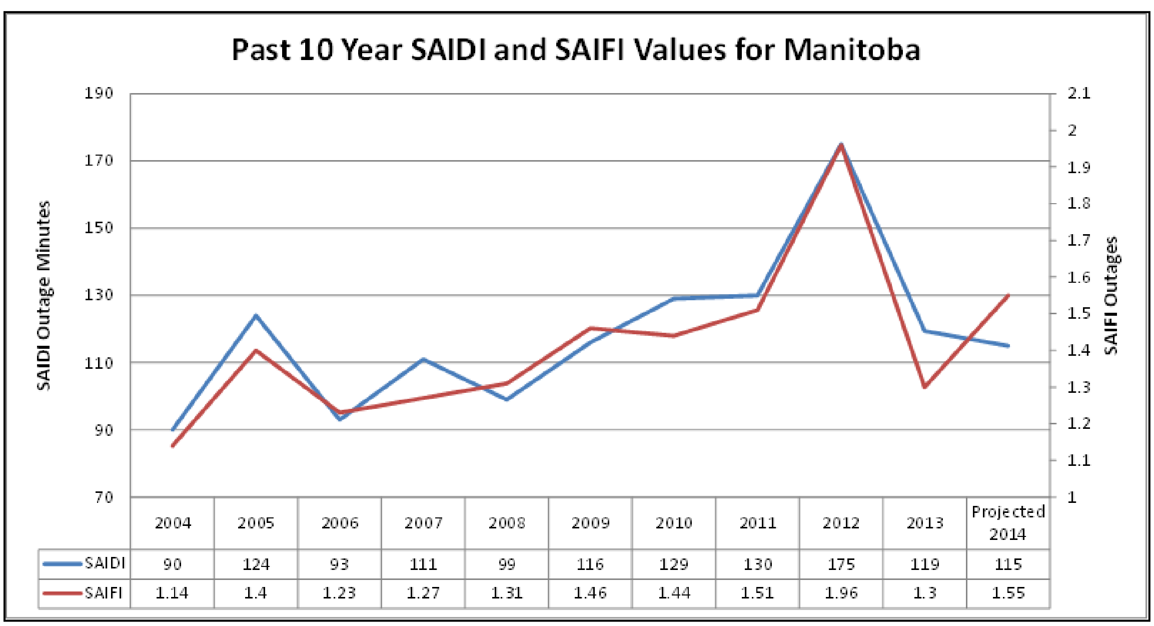


Figure 2.28: Hydraulic Generation Forced Outage Rates

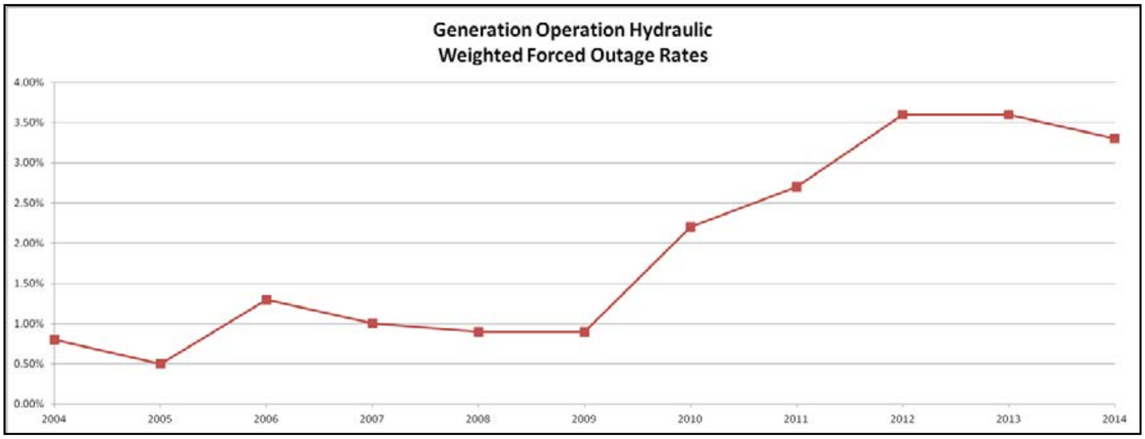
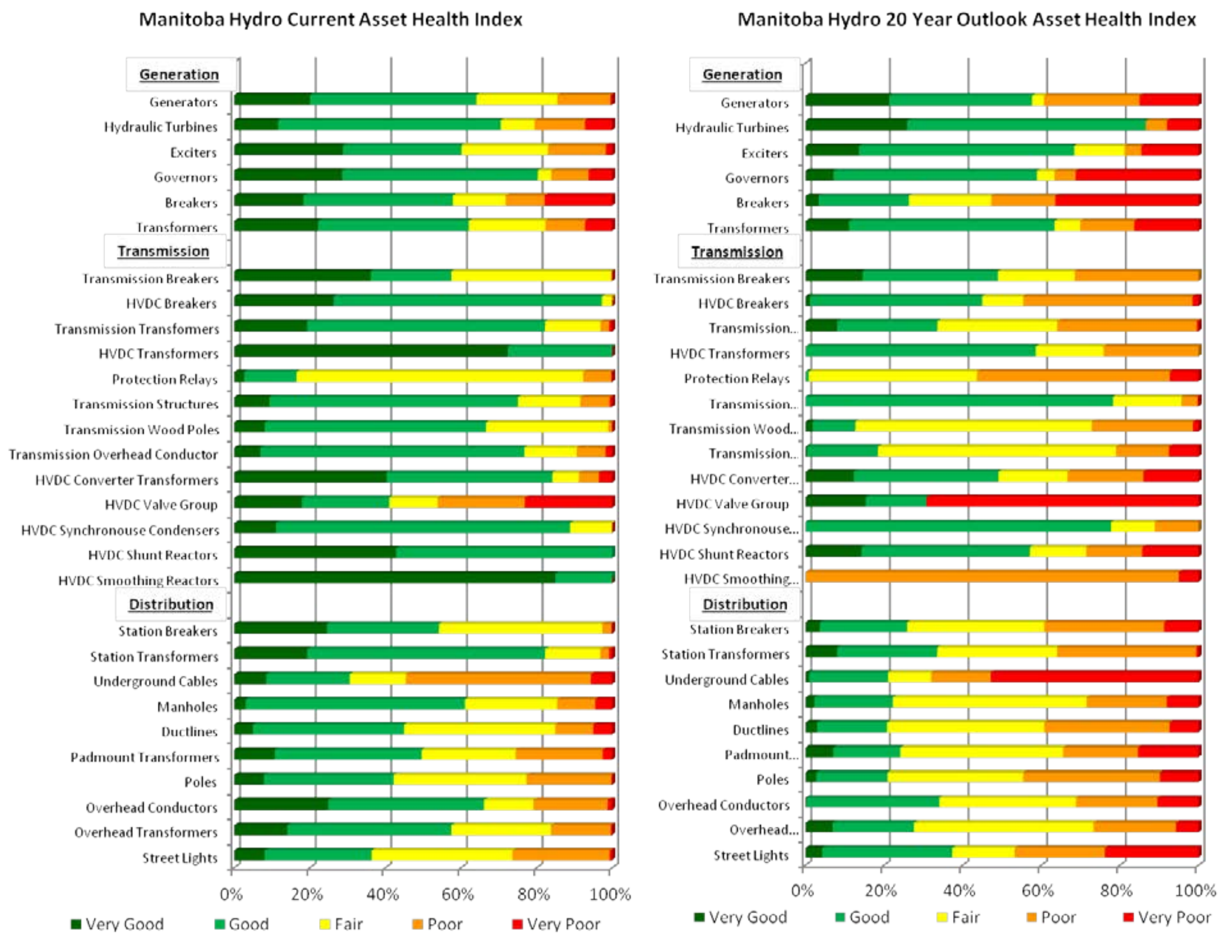


Manitoba Hydro uses an Asset Health Index ("AHI") to quantify equipment condition based on numerous parameters, to indicate whether the asset type is in very poor, poor, fair, good or very good condition. The figures below provide a summary of current AHI results for Manitoba Hydro's generation, transmission and distribution asset types, as well as the 20 year outlook of the AHI based on current asset replacement rates.

Figure 2.29: Asset Health Indices- Current & 20 Year Outlook



As a larger percentage of assets age beyond life expectancy, they will begin to fall into the poor and very poor categories and system failures and customer outages are expected to occur on a more regular basis. As such, replacement rates in the majority of Manitoba Hydro's asset types need to be increased to better align with life expectancy.

The rate increases proposed in the Application are the minimum required to fund the necessary capital investment to replace Manitoba Hydro's aging infrastructure. The following summarizes some of the major risks that would be associated with inadequate funding of sustaining capital:

- Reliability would degrade further, outages would become longer and more frequent;
- Extraprovincial revenues would be lost as a result of additional generation equipment failures;

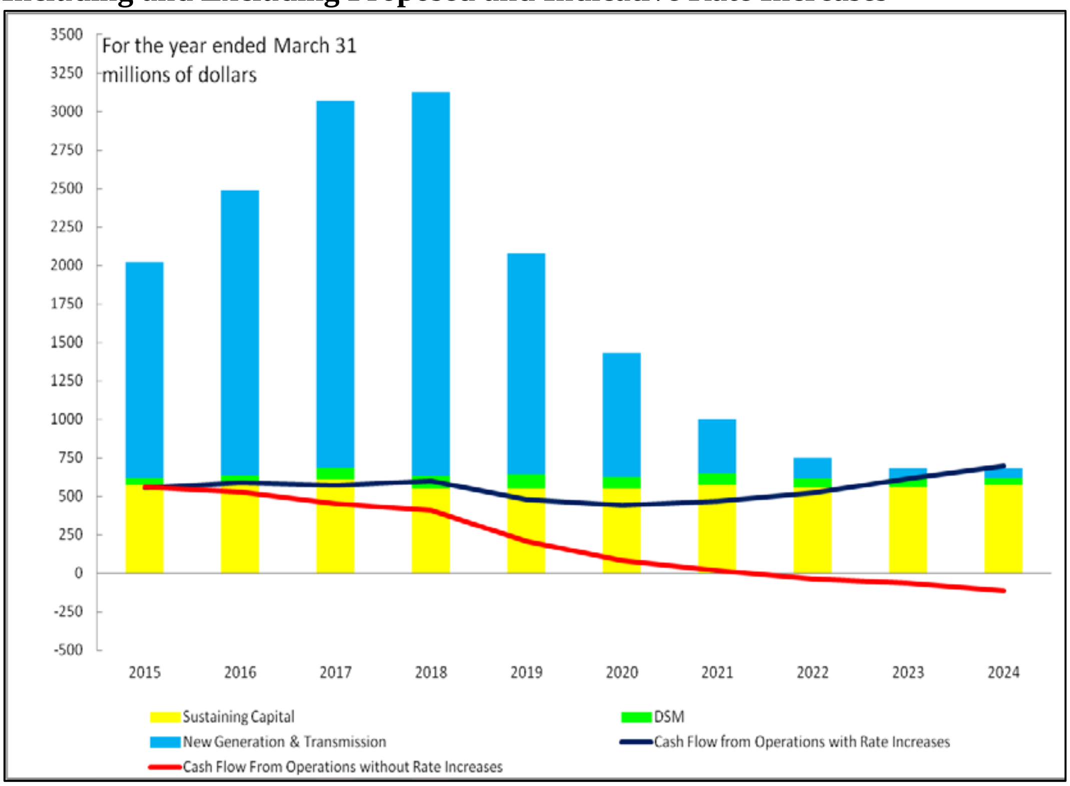
- Timeframes for repair/replacement would be impacted by insufficient lead times;
- Increased safety risks to public and staff;
- Maintenance and emergency costs would increase; and,
- Backlog of requirements would overwhelm the capability of resources to respond.

With the proposed rate increases, Manitoba Hydro will be in an improved position to fund the necessary investments in order to continue to provide the high level of safe and reliable service to which customers are accustomed.

2.4.3 Increased Borrowing Requirements Result in Higher Levels of Debt and Carrying Costs, which will Ultimately Need to be Recovered from Customers

As can be seen in the following figure, without the proposed and indicative rate increases, Manitoba Hydro would be required to fund a continually increasing portion of its sustaining capital expenditures through debt financing as opposed to through the cash flow generated from operations.

Figure 2.30: Electricity Capital Expenditures and Cash Flow from Operations Including and Excluding Proposed and Indicative Rate Increases



Maintaining reasonable financial ratios through regular and reasonable rate increases is in the best interests of customers as it reduces the need for borrowing and additional financing costs that must be borne by customers, which serves to reduce the pressure on future rates and provide more financing flexibility in the event of adverse financial circumstances.

It is important that Manitoba Hydro be granted the proposed rate increases to be able to generate sufficient cash flow from operations to finance sustaining capital expenditures. This will allow Manitoba Hydro to maintain reliable service to customers in a sustainable manner.

2.4.4 Potential Negative Implications to the Provincial Credit Rating and Manitoba Hydro's Borrowing Costs

The Province of Manitoba has a high credit rating as can be seen in the following figure that shows the long term credit ratings for each of the Canadian provinces. As Manitoba Hydro receives a flow through credit from the Province of Manitoba, this high credit rating benefits its customers by reducing the cost of borrowing that the Corporation must recover in its rates.

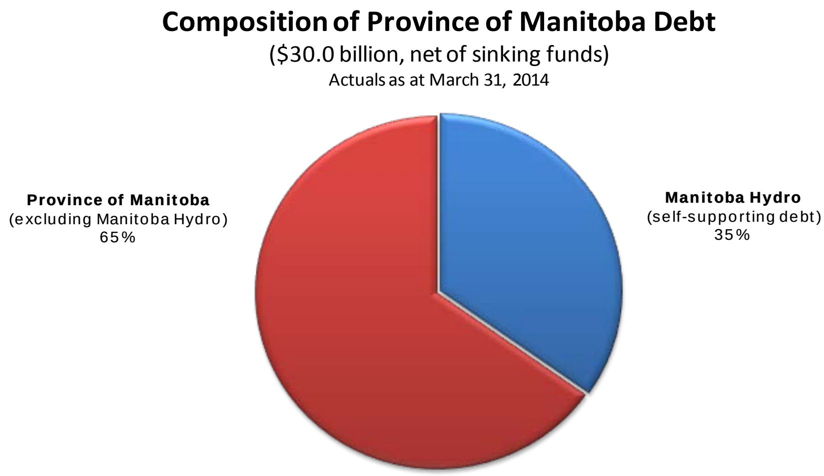
Chart 2.31: Provincial Long Term Credit Ratings Comparison

Province	Standard & Poors	DBRS	Moody's Investors Service
British Columbia	AAA	AA (high)	Aaa
Saskatchewan	AAA	AA	Aaa
Alberta	AAA	AAA	Aaa
Manitoba	AA	A (high)	Aa1
Ontario	AA-	AA (low)	Aa2
Nova Scotia	A+	A (high)	Aa2
Newfoundland & Labrador	A+	A	Aa2
Québec	A+	A (high)	Aa2
New Brunswick	A+	A (high)	Aa2
Prince Edward Island	A	A (low)	Aa2

Rating reports are issued to individual provinces and not necessarily at the same time.

As demonstrated in Figure 3.32, debt advances to Manitoba Hydro form a significant portion of the total provincial debt and the Corporation's financial performance is therefore a contributing factor toward the financial strength and stability of the Province's credit rating. The Credit Rating Agencies view Manitoba Hydro to be financially self-supporting in that the Corporation is able to meet its financial obligations based on its own revenues without being supported by the tax-base of the Province.

Figure 2.32: Composition of Province of Manitoba Debt



Credit rating agencies view Manitoba Hydro's current low rates and reasonable regulatory framework as positive ratings considerations. It is important that credit rating agencies continue to view Manitoba Hydro's debt as self-supporting and that weakened financial ratios as a result of major capital investments and reinvestments do not negatively impact the credit ratings of the Province or Manitoba Hydro's borrowing costs.

The proposed rate increases are necessary to continue to demonstrate to the credit rating agencies that the regulatory framework in Manitoba is supportive of Manitoba Hydro's self-supporting financial status.

2.5 AREAS OF CONCERN RAISED IN PREVIOUS PROCEEDINGS

In the 2012/13 & 2013/14 GRA and Interim Application for Rates Effective April 1, 2014, there were a number of concerns expressed that Manitoba Hydro would like to address in this section of the Application.

2.5.1 Rate Increases are Required Notwithstanding More Favourable Near-term Financial Results

In past proceedings, it has been suggested that in years where the current financial results are favourable, lower rate increases would be sufficient to maintain the short-term financial position of the Corporation.

Manitoba Hydro's MH14 is forecast based on expected water flows for the first year of the forecast (2014/15), median water flows for the second year of the forecast (2015/16), and the average revenues for all water flow conditions for the past 102 years for the subsequent years of the forecast (2016/17 and thereafter).

In the near term, to 2016/17, projected net income from electric operations (including the proposed rate increases) is higher in MH14 as compared to MH13, largely due to favourable water flow conditions, as well as lower finance and depreciation expense. Although inflow conditions are currently favourable and Manitoba Hydro has confidence that these conditions will persist until the end of March 2015, water inflow conditions in fiscal 2015/16 are very uncertain and can be quite different from those assumed in MH14. The main factor that determines water supply conditions in 2015/16 is precipitation, which is highly variable and unknown at this time. MH14 assumes median water inflows in 2015/16 which means that there is an equal probability that water inflows will be higher or lower.

Notwithstanding the more favourable near-term results, there are lower net earnings projected in the remaining years of MH14, such that between the period 2017/18 to 2023/24 projected net earnings from electric operations (including indicative rate increases of 3.95% per year) are $666 million lower compared to MH13.

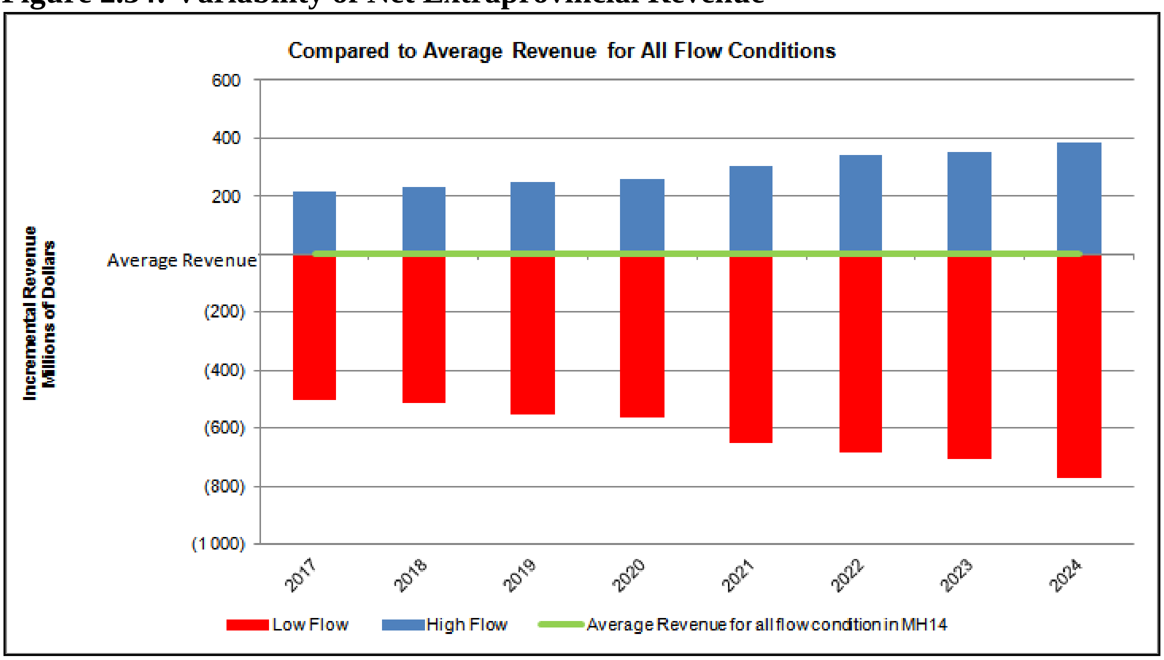
In total, MH14 projects net losses of $901 million between 2018/19 and 2023/24. As a result, financial reserves are projected to deteriorate from the current level of $2.7 billion to $2.0 billion by 2023/24.

Figure 2.33: Comparison of Electric Operations Net Income MH14 to MH13

	Forecast 2014/15	Forecast 2015/16	Forecast 2016/17	10 Year Cumulative to 2023/24	20 Year Cumulative to 2033/34
Current Forecast (MH14)	$ 102	$ 115	$ 59	$ (559)	$ 3 003
Previous Forecast (MH13)	55	12	19	(85)	4 775
Increase/ Decrease	$ 48	$ 103	$ 41	$ (474)	$ (1 772)

It is also important to recognize that Manitoba Hydro's financial results are subject to significant volatility based on potential changes in water flow conditions. This is demonstrated by the following chart which compares the potential increase in net extraprovincial revenues as a result of high water flows (blue bars) with the potential decrease in net extraprovincial revenues associated with low water conditions (red bars) for the period from 2016/17 to 2023/24. In this chart, the bolded green line represents the average revenues for all flow conditions upon which the extraprovincial revenues in MH14 have been forecast.

Figure 2.34: Variability of Net Extraprovincial Revenue



The 3.95% indicative rate increases are derived based on the assumption of average revenues for all water flows. Actual water flows and the associated financial impacts will deviate either up or down from the assumption of average. Over time, the financial impacts resulting from low and high water flows will balance out. In order to maintain

the indicative even annual rate increases over the long-term, it is necessary that rate increases be implemented gradually even in years with favourable water flows and financial results. The law of averages dictates that implementing lower rate increases in reaction to years with favourable water conditions, will result in the need for higher rate increases in years with lower water conditions in order to balance out with average revenue requirements over the longer term. This approach does not contribute to rate stability for customers.

As a result of the extensive investments that Manitoba Hydro has to make to continue to provide safe and reliable service to customers, there is a requirement for a period of continual rate increases to cover the associated costs. Setting rates considering longer-term revenue requirements, as opposed to being overly focused on the shorter term financial outlook, is the prudent approach and in the best interest of customers. Focusing only on the short term, will inevitability result in rate instability as ratepayers will be faced with substantially higher rate increases in the future, especially considering the longer term and significant investments Manitoba Hydro is undertaking.

The Corporation believes that the position advanced by the Green Action Centre (page 3 of its written submission) as part of Manitoba Hydro's Application for Interim Electric Rates effective April 1, 2014 appropriately acknowledges that the proposed rate increases should be assessed through a longer-term perspective.

> *"In order to reconcile the variability of the Manitoba Hydro revenue stream with the stability desired by many of Manitoba Hydro's customers, the Board ought to look at setting rates on the basis of longer term trends as opposed to the actual results of last year's revenues or the short-term conditions, be they favourable or unfavourable. GAC is of the view that the current longer term trends point strongly in the direction of requiring more revenue for Manitoba Hydro"*

While reducing rate increases in the short-term may offer some temporary relief to ratepayers in the immediate year, the reality is that doing so does not eliminate the impact on consumers but only defers the rate increase to a future period. Regular and moderate rate increases, such as those proposed in this Application, minimize the impact to ratepayers arising from the unavoidable need to make the necessary investments in Manitoba Hydro's system and the risk associated with adverse conditions such as below average water flow conditions. Such an approach is critical when considering the long term significant investments that Manitoba Hydro is undertaking on behalf of customers.

If Manitoba Hydro has short-term results that are more favourable than forecast, the situation is actually beneficial for customers as the Corporation would be required to borrow less debt, which would ultimately reduce the costs to be recovered from ratepayers. The forecast net income for the three-year period is not unreasonable when one considers the size of Manitoba Hydro's asset base, and that the implied return on equity would be less than 2-3%, well below the return requirements if Manitoba Hydro was a privately owned utility.

To ensure rate stability for customers, Manitoba Hydro submits that the most reasonable and prudent approach is to implement regular and reasonable rate increases, even during periods of favourable water flows, thereby balancing the inevitable years of less favourable than forecast results where water flows are below average.

2.5.2 Inflationary Rate Increases are Not Sufficient to Maintain Rate Stability for Customers

In past proceedings, it has been suggested that Manitoba Hydro's rate increases be limited to inflationary adjustments, in or around 2% per year, in order to maintain Manitoba Hydro's short-term financial position.

As an example of the risk to customers of allowing only 2% rate increases in the short-term, the following charts demonstrate the impacts to net income, retained earnings, and financial ratios of continual 2% rate increases for the period from 2016 to 2024, as compared to the proposed and indicative rate increases of 3.95%.

Figure 2.35: Projected Net Income (2015-2024)

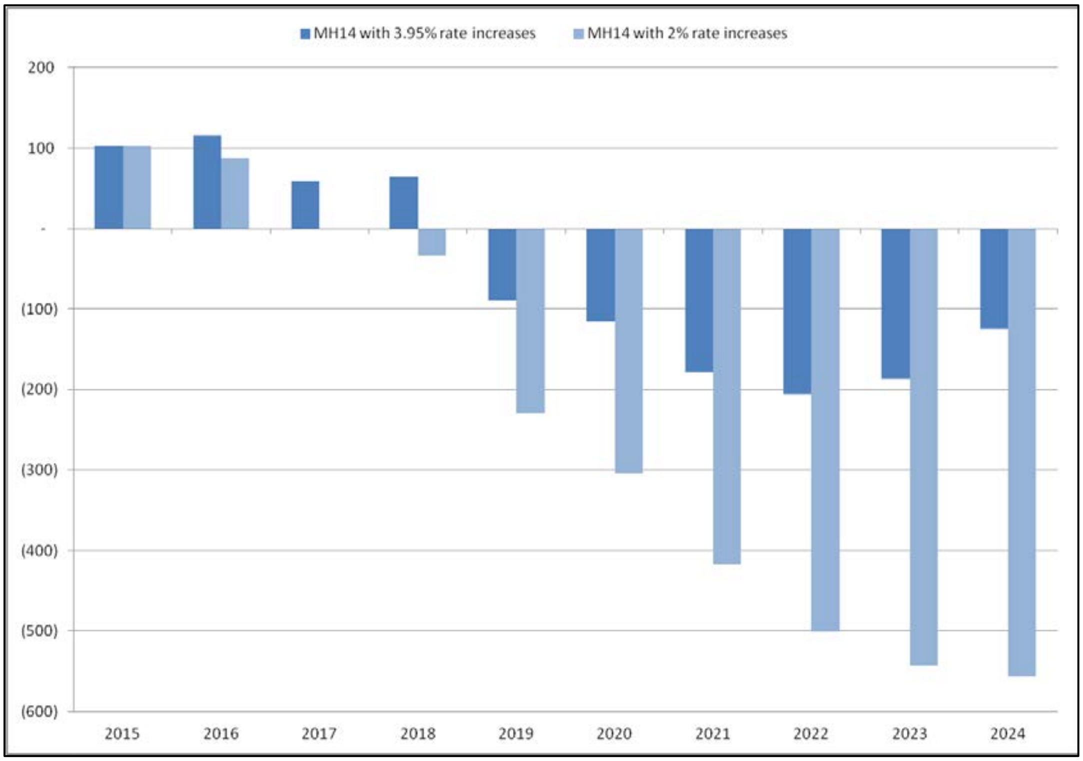


Figure 2.36: Projected Retained Earnings (2015-2024)

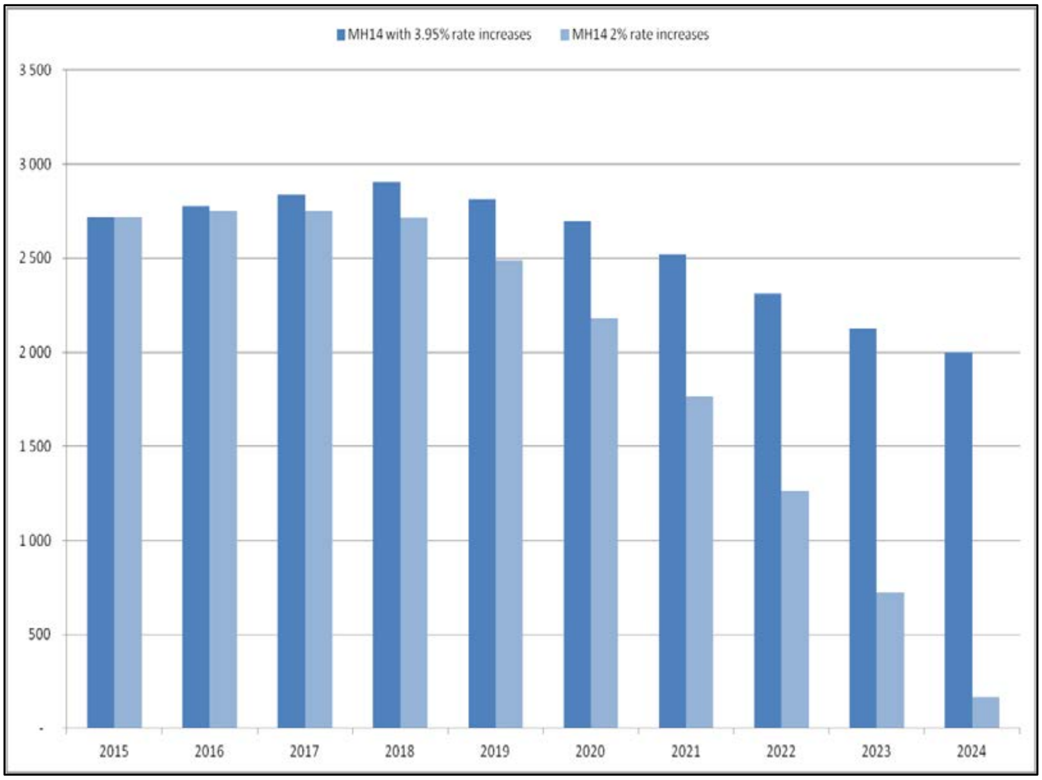

Figure 2.37: Projected Equity Ratio (2015-2024)

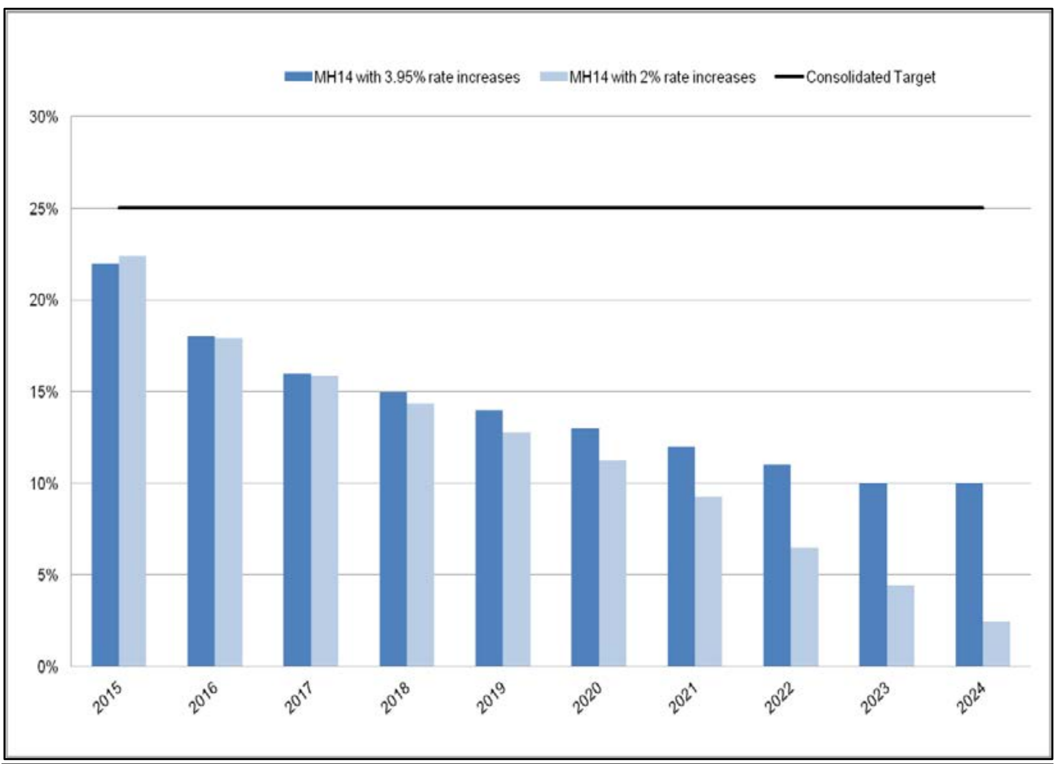

Figure 2.38: Projected Interest Coverage Ratio (2015-2024)

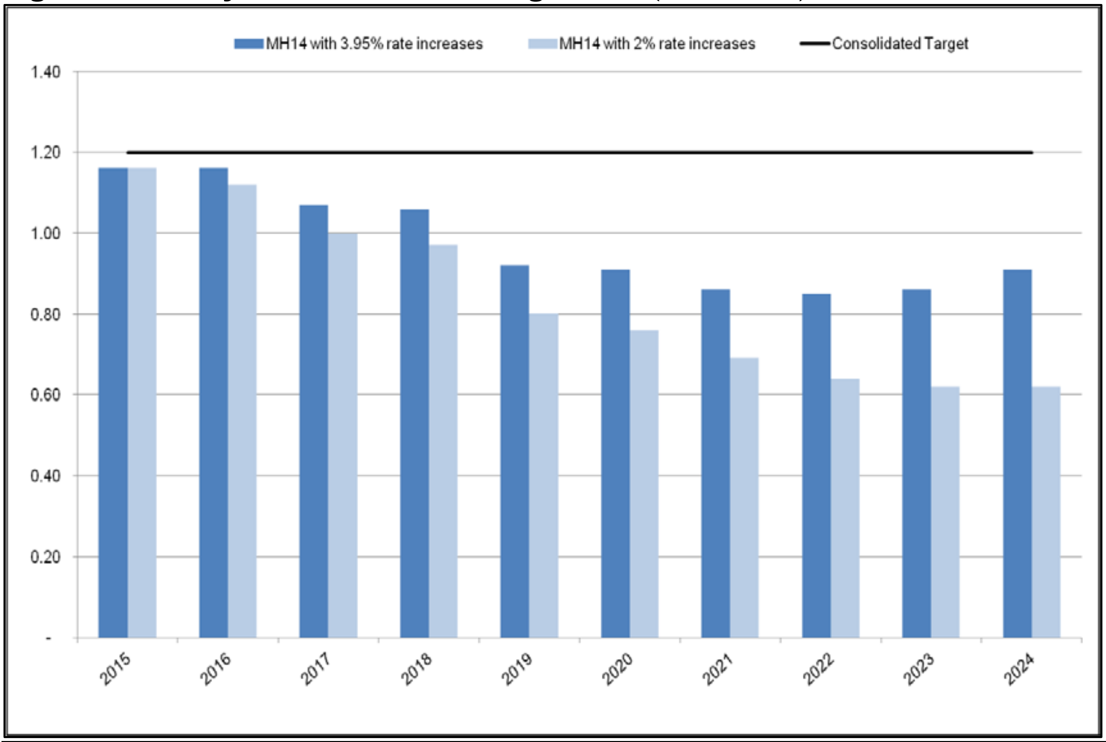

Figure 2.39: Projected Capital Coverage Ratio (2015-2024)

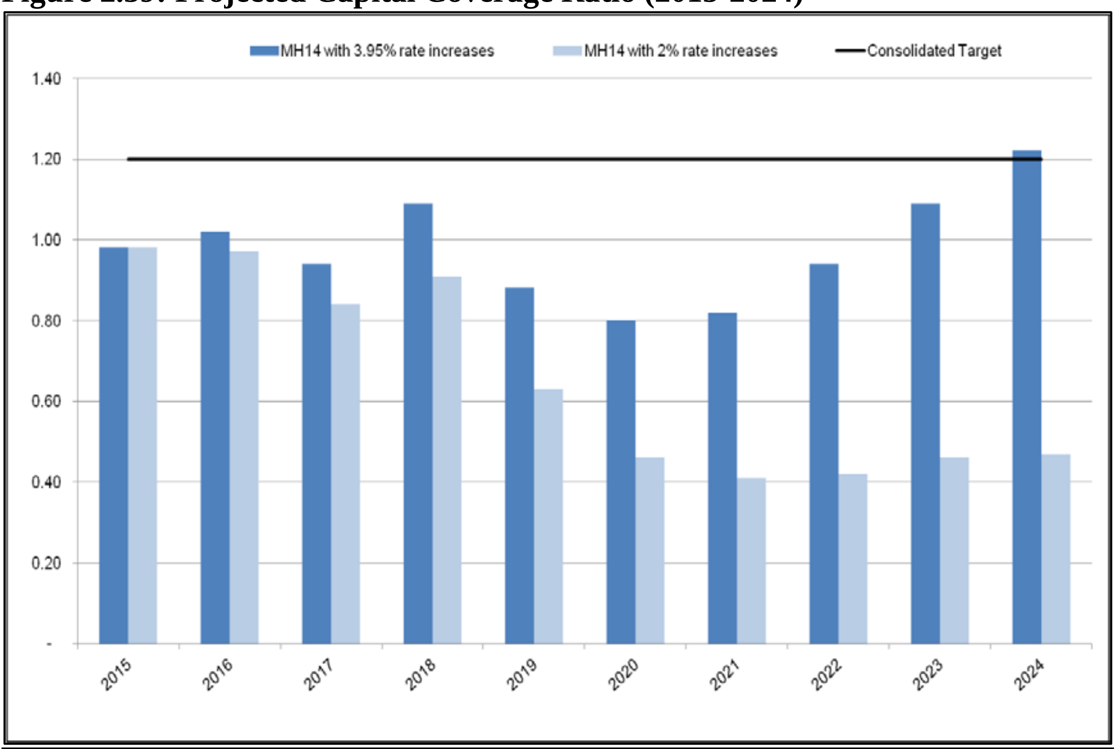


The projected increases in Manitoba Hydro's revenue requirement are being largely driven by the extensive investments to be made on behalf of domestic customers, which are much more significant than inflationary cost pressures.

A rate increase that is based upon inflation jeopardizes Manitoba Hydro's ability to provide rate stability to customers as it will be unable to recover its costs of providing an essential service and ensure sufficient financial reserves are in place. Similar to the suggestion that a rate increase can be forgone during those years where current results are better than projected, granting a rate increase that does not allow the utility to recover its costs each year will only result in higher borrowing requirements in future. The impact of deferring or reducing the needed 3.95% rate increases will be to the detriment of customers, as it serves to increase the requirements for higher rate increases in the future than have been projected in MH14. This approach does not achieve rate stability in the long-run and will subject consumers to increased rate volatility in the future.

2.5.3 Manitoba Hydro is Effectively Controlling its Costs to Maintain Projected 3.95% Rate Increases

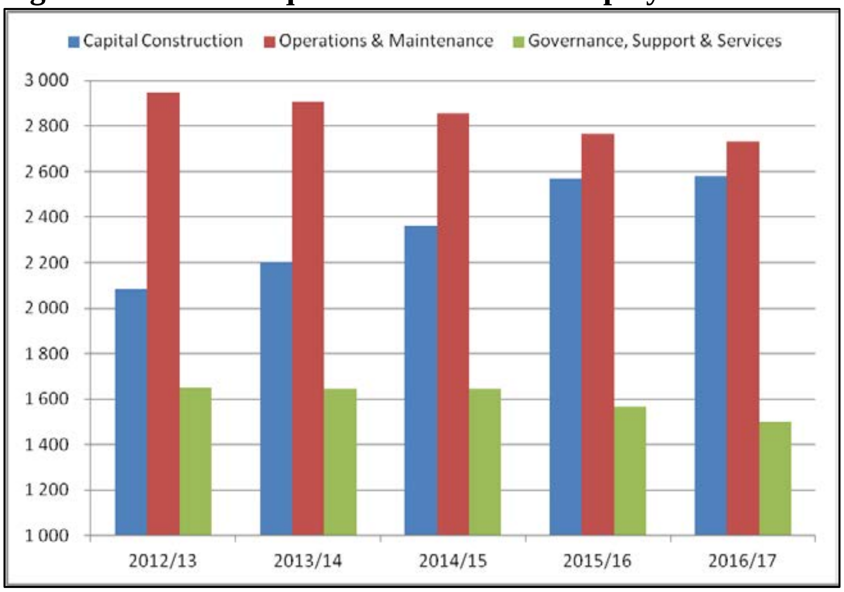
In past proceedings, concerns have been expressed about Manitoba Hydro's efforts to contain its operating costs.

Manitoba Hydro is committed to carefully managing its costs and utilizing resources efficiently and effectively to fulfill its mandate and provide maximum value to its stakeholders and ratepayers. In order to fulfill this commitment, Manitoba Hydro continues to develop measures to manage its operating costs, while at the same time balancing the need to ensure staffing levels are adequate to provide safe and reliable service.

Manitoba Hydro's most significant cost in providing service to customers is wages and benefits. Manitoba Hydro has undertaken an extensive review of its staff complement and is committed to reducing approximately 300 operational positions over the 3 year forecast period from 2014/15 to 2016/17. These reductions will be achieved through attrition through the application of technology, and the consolidation and elimination of work processes where appropriate.

The following figure provides a summary of the Corporation's actual and projected Equivalent Full Time ("EFT") employees for the period 2012/13 to 2016/17 segregated between those EFTs that work on capital construction, operations & maintenance, and provide governance & support services. As should be expected during a period of significant capital investment the EFTs associated with capital construction are increasing. In contrast, consistent with Manitoba Hydro's commitment to manage its operating costs, the number of EFTs associated with operations & maintenance and governance & support activities are forecast to decline.

Figure 2.40: Total Equivalent Full Time Employees



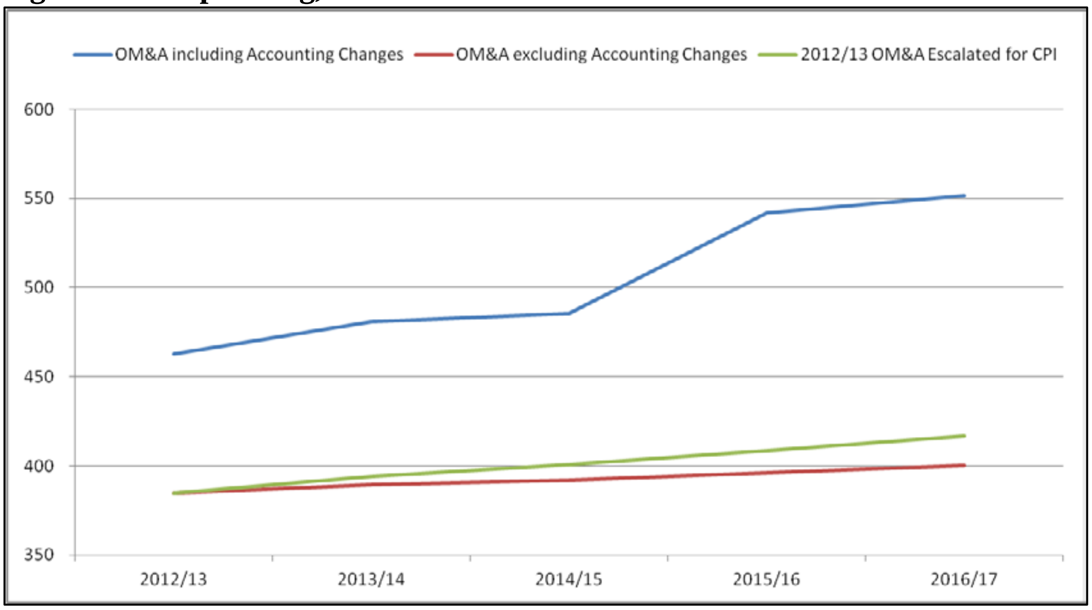
Manitoba Hydro is continually undertaking a number of initiatives across the various Business Units that are intended to result in further operating and capital cost savings. Some of these key initiatives include:

- Consolidation of Rural District Offices
- Implementation of Mobile Workforce Management
- Review of the Gillam Redevelopment & Expansion Project
- Supply Chain Management Initiatives

As shown in the following figure, these measures will allow the Corporation to maintain Operating, Maintenance & Administrative cost increases at an annual average increase of 1% per year (excluding accounting changes that impact OM&A) through fiscal 2016/17 and beyond, which is below inflationary levels. These cost containment measures have assisted the Corporation in maintaining projected annual rate increases at the same 3.95% level as those projected in MH13, despite the Corporation facing significant and increasing cost pressures. This is consistent with the expectations of the PUB in Order

43/13, wherein it recommended that Manitoba Hydro control OM&A costs increases below inflation.

Figure 2.41: Operating, Maintenance & Administrative Costs



2.5.4 Proposed Rate Increases are Not Being Driven by Aggressive Accounting Policy Selection

In past rate proceedings, concerns have been expressed that Manitoba Hydro's rate increases are being driven by aggressive accounting policy choices, in particular the expensing of additional overheads and the proposed change to the depreciation methodology.

In Order 43/13, the PUB accepted the accounting policy changes that have been made by Manitoba Hydro to 2013/14 for the purposes of rate setting but indicated that until an IFRS Status Update Report is filed at the next GRA, no further changes should be made for rate-setting purposes.

As is outlined in further detail in this Application, there are a number of prospective accounting changes that Manitoba Hydro is making for financial reporting purposes in 2014/15 and 2015/16. The most significant of these include the implementation of a comprehensive depreciation study in 2014/15 and further changes to the level of capitalized overhead and deprecation methodologies as part of the implementation of IFRS in 2015/16.

As summarized in Figure 2.42, these changes offset each other and result in an overall reduction in Manitoba Hydro's future revenue requirements. The significance of the net changes are minimal in the 2015 to 2017 period, and are clearly not driving the need for future rate increases during this timeframe.

Figure 2.42: Accounting Policy & Estimate Changes

Accounting Policy & Estimate Changes Electric operations (in millions of $s)	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024
OM&A Expense Changes		51	56	57	58	58	59	60	61	62
Depreciation Expense Changes	(25)	(53)	(57)	(60)	(76)	(86)	(96)	(101)	(103)	(105)
Other		(3)	(3)	(4)	(3)	(3)	(4)	(4)	(3)	(4)
Total Increase (Decrease) in Revenue Requirement	(25)	(4)	(4)	(7)	(22)	(31)	(41)	(45)	(46)	(48)

Given that the net impact of these changes are not driving the need for rate increases and not harming ratepayers, it is the position of Manitoba Hydro that IFRS financial reporting policies should be adopted for rate-setting purposes.

Furthermore, as has been the position of Manitoba Hydro in previous rate proceedings, under the cost of service rate-making approach that has been utilized by Manitoba Hydro, it is unnecessary and undesirable to maintain two sets of financial records, one for financial reporting purposes and one for rate-setting purposes. To have two sets of financial records could cause confusion for Manitoba Hydro's various stakeholders, including the PUB as they would be using different sets of financial information to make important decisions with respect to the Corporation's operations and finances.

2.5.5 Manitoba Hydro is Projecting Deterioration of its Financial Ratios to Mitigate the Rate Increases to Customers

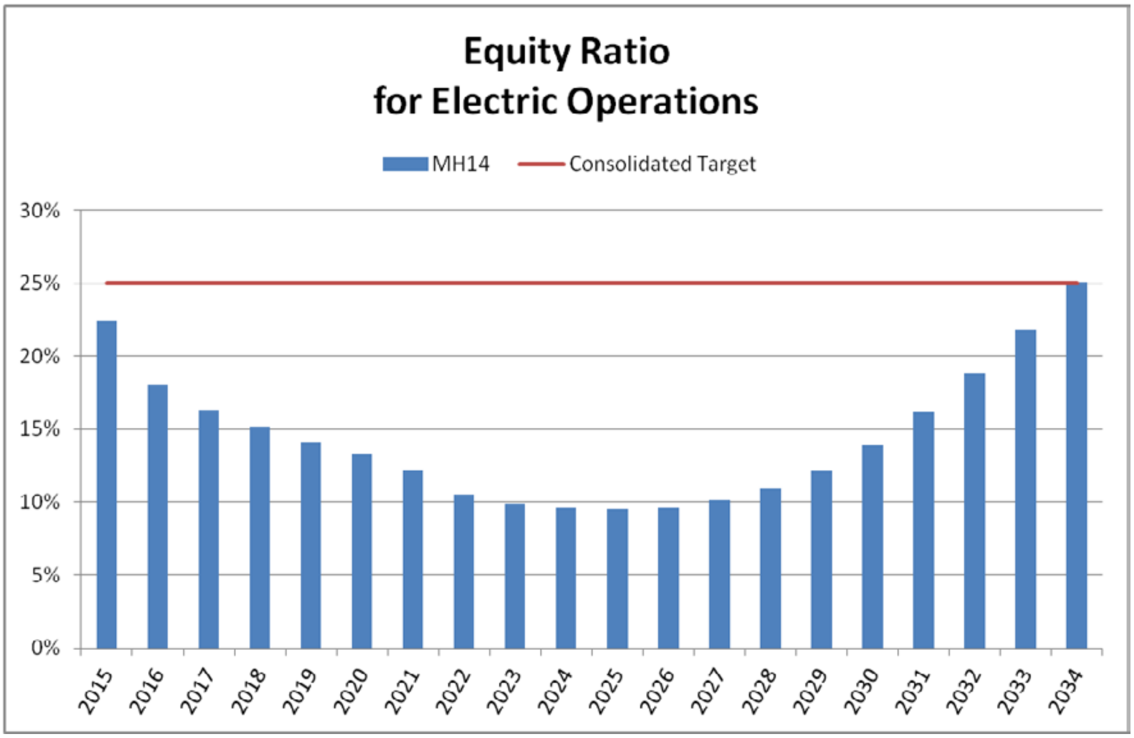
There has been a suggestion that Manitoba Hydro should relax its 75/25 debt-to-equity target to moderate its proposed electricity rate increases.

Manitoba Hydro recognizes that the rate increases that would be necessary to maintain its financial ratios at or above targets in the near to medium term, would be financially challenging for its customers. Further, this would be inconsistent with Manitoba Hydro's approach of smoothing rate increases over time in order to promote rate stability. Consequently in MH14, financial results and ratios are projected to be significantly below target for an extended period of time. Notwithstanding Manitoba Hydro's desire to smooth rate increases to customers over time, the Corporation recognizes that the 3.95%

rate increases are the minimum that are required to maintain rate stability and financial integrity.

As demonstrated in the following figure, even with the 3.95% rate increases Manitoba Hydro's electric operations equity ratio is expected to deteriorate to 10% by 2022/23, and not recover to the 25% target until 2033/34.

Figure 2.43: Equity Ratio for Electric Operations MH14



Manitoba Hydro's interest coverage and capital coverage ratios are also well below targets for an extended period of time and only recover within the later years of the 20 year forecast period. The retained earnings with respect to electric operations are projected to decrease to $1.9 billion by 2024/25, which is barely sufficient to absorb the impact of the reoccurrence of the historic 5-year drought, and does not provide sufficient reserves to mitigate the potential financial impacts of the considerable array of the risks the Corporation faces in fulfilling its mandate.

Relaxing the longer-term financial targets will not negate the need for the requested rate increases, as the 3.95% proposed and indicative rate increases are the minimum necessary to manage the significant deterioration in Manitoba Hydro's projected financial results and ratios in the next 10 year period.

2.5.6 It is Appropriate to Set Rates for 2016/17 as Part of the Current Rate Proceeding

In Order 49/14, the PUB indicated that it would be reluctant to approve rates for 2016/17 as Manitoba Hydro is undergoing a period of significant and fairly rapid change.

Manitoba Hydro acknowledges that it is embarking on a period of unprecedented capital expenditures to meet the energy needs of Manitobans. While there have been a number of regulatory proceedings in the past where Manitoba Hydro's major capital plans have been discussed at length, the Corporation has now received the necessary approvals and has commenced construction on the Bipole III Reliability Project in the winter of 2013, and the Keeyask Generating Station in the summer of 2014. As well, the Corporation has completed a more comprehensive assessment of the condition of its assets and the capital requirements associated with the renewal of its existing asset base, and is pursuing an enhanced Power Smart program with a significantly higher level of investment. As such, there is now more certainty with respect to Manitoba Hydro's investment requirements than there has been in the recent past.

In this environment, it is the view of Manitoba Hydro that it is most appropriate to begin to address the rate-setting and revenue requirement matters associated with these investments on a proactive basis, rather than to defer their consideration solely to future rate proceedings. Accordingly, Manitoba Hydro submits that the examination of the 2016/17 rate increase during this proceeding is both appropriate and desirable.

Manitoba Hydro also notes that, in the normal course, it seeks approval of rates for two forward looking test years based on the Corporation's most up to date financial forecast. Accordingly, the filing of a GRA early in 2015 would normally address two future test years (2015/16 and 2016/17).

If Manitoba Hydro were to proceed with a GRA for the 2014/15 and 2015/16 test years only at this time, the financial requirements are such that it would be necessary to file a subsequent GRA later in 2015, which would include the 2016/17 test year. Such an Application would follow only a few months after the conclusion of the proceeding for the current GRA and would necessitate the need for Manitoba Hydro to request another interim rate increase in order to implement new rates effective April 1, 2016. In Manitoba Hydro's view, deferring the consideration of the 2016/17 rate change to a future regulatory proceeding is not in the best interest of customers as it exposes them to another interim rate increase for 2016/17 and does not promote regulatory efficiency.

2.6 THE PROPOSED RATE INCREASES ARE ESSENTIAL TO PROVIDE CUSTOMER VALUE

Manitoba Hydro takes great pride in providing Manitobans with reliable service and some of the lowest electricity rates in North America. This has been accomplished through careful management of its assets, prudent spending on capital projects and by managing its operating and administrative costs.

Manitoba Hydro is now entering a period of extensive investment and re-investment in its infrastructure. This investment is needed for three main purposes: 1) to meet the growing energy needs of Manitoba families and businesses, 2) to replace aging generation, transmission and distribution assets that are approaching the end of their service lives, and 3) to address capacity issues on the existing system. Manitoba Hydro is committed to using revenues prudently for these purposes and demonstrating that its actions are cost effective, efficient and fiscally responsible.

The revenues from the proposed rate increases are necessary so that Manitoba Hydro can deliver on its mandate by:

- Continuing to deliver a reliable energy supply to Manitobans by funding the necessary investments to respond to the need for system growth and asset replacement;
- Funding Power Smart programs to assist customers in meeting their energy needs in a cost effective manner;
- Continuing to provide rates that are affordable for Manitoba families and that support the competitiveness of Manitoba business;
- Ensuring rate stability and predictability for customers by maintaining its financial strength; and,
- Equitably serving the needs of all Manitoba residents, regardless of where they live in the province—urban or rural, remote or central, north or south.

Manitoba Hydro conducts its business operations in an environmentally, socially, and fiscally responsible manner, and with the revenues from the proposed rate increases can continue to provide customers with reliable service and stable rates into the future.

Corporate Strategic Plan

The Riel Reliability Improvement Initiative is key to Manitoba Hydro's commitment in maintaining a reliable supply of electricity.

Manitoba Hydro

Message from the President & CEO

Manitoba Hydro's Corporate Strategic Plan (CSP) is the primary tool for the Executive Committee and Manitoba Hydro-Electric Board to establish, communicate and drive corporate priorities and strategy within the organization. The CSP is dynamic and designed to reflect the evolving nature of the energy industry within which Manitoba Hydro operates. It will be updated and re-published every three years unless changes to the strategic direction prompt a need for an earlier revision.

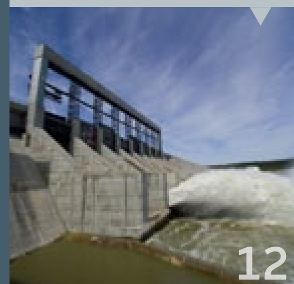
Most people flip a switch or turn up the thermostat without much thought as to where the energy behind it comes from. In the past year we have initiated a discussion with customers to consider what lies behind the switch. To provide a reliable supply of electricity and natural gas to meet the current and future energy needs of the province we must invest to renew, upgrade and construct new infrastructure.

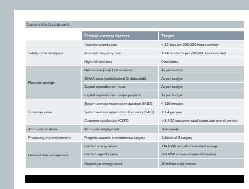
Our plan continues the proven strategy of developing this province's clean, renewable hydro resources and building interconnections to leverage the associated export sale opportunities while enhancing reliability. To meet the province's energy needs, the most economic options are pursued which continue to include aggressively pursuing demand side options. We are investing in a powerful future for Manitoba, ensuring the next generation will continue to enjoy the benefits of affordable, reliable and sustainable electricity when they need it.

As a Crown Corporation, Manitoba Hydro is committed to being an outstanding corporate citizen. We aspire to create positive relationships with our customers, employees and all stakeholders. The Corporation works closely with economic development agencies to attract new business, encourage expansion of existing businesses and to retain existing customers. Through purchasing, investments and job creation, Manitoba Hydro is a significant contributor to economic development in communities province-wide.

I am proud of our company and its achievements. I know the future promises to be an exciting and challenging one. I'm confident that our employees will continue to do what they've always done – take personal responsibility for their own contributions and embrace these new challenges head on.

Scott A. Thomson, CA
President & CEO





Vision

To be recognized as a leading utility in North America with respect to safety, reliability, rates, customer satisfaction and environmental leadership.

Mission

To provide for the continuance of a supply of energy to meet the needs of the province and to promote economy and efficiency in the development, generation, transmission, distribution, supply and end-use of energy.

Operating principles

Work together for the success of the organization as a whole, recognizing that all our activities are interrelated.

Establish long-term cooperative relationships with all employees, customers, suppliers and other stakeholders, aimed at achieving our shared Vision.

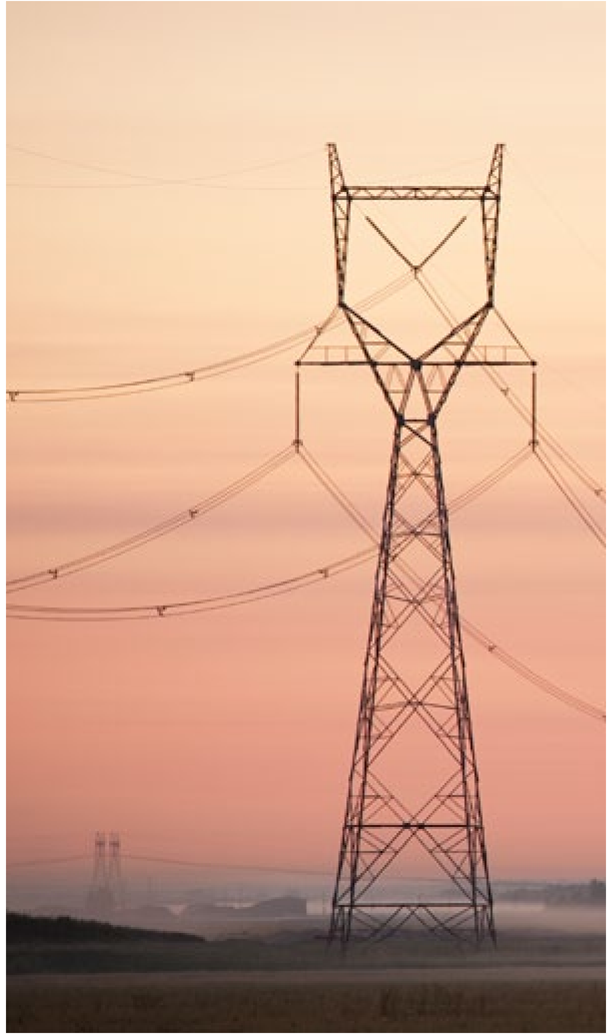
Create a working environment that removes barriers to effective performance and which fosters mutual respect, trust and open communication.

Promote a safety-focused culture in which all employees support and demonstrate safe work behaviors.

Provide opportunities for all employees to develop their full potential, recognizing people's inherent desire to do their best.

Measure outcomes, develop an understanding of the causes of variation from planned performance and take appropriate action.

Drive continuous improvement by identifying opportunities to streamline processes and improving efficiencies across the organization as a whole.



Above: 500-kilovolt tower at sunrise near Winnipeg's north Perimeter Highway and Highway 7.

Electricity

The Manitoba demand for electricity is continuing to grow and new energy sources are required. This is a direct result of Manitoba's continued economic growth through:

- Increases in population and related services;
- Higher average energy usage per residential customer;
- Continued Manitoba industrial and commercial customer expansion.

To meet this increased demand, Manitoba Hydro's plan continues to include aggressively pursuing demand side options and developing clean, renewable hydro resources. It also includes new transmission interconnection and distribution infrastructure to deliver power to Manitoba customers with enhanced access to export markets.

The plan includes:

- Power Smart* energy conservation programs (> 800 MW in planned cumulative capacity savings);
- Keeyask generation, 695 MW;
- Conawapa generation, 1 485 MW;
- Transmission associated with Keeyask and Conawapa;
- Investment in a significant portion of existing infrastructure to renew and upgrade the electric system to improve the reliability of supply.
- Additional transmission import/ export capacity to Minnesota and Wisconsin;
- New major export sales.

Manitoba Hydro is a licensee of the Trademark and Official Mark.

Left: One of three transformers moving through the streets of Winnipeg to the Riel station in Springfield. They were installed as part of Manitoba Hydro's reliability improvements on its 500-kilovolt line linking Manitoba and Minnesota.

Electricity (continued from page 4)

This plan, relative to alternative options:

- Results in the overall highest net benefits to Manitoba Hydro and lowest long-term domestic rates for Manitobans;
- Supports Manitoba Hydro's long-term fiscal health;

Above: About 96 per cent of the electricity Manitoba produces each year – 30 billion kilowatt-hours on average – is clean, renewable power generated at 15 hydroelectric generating stations on the Nelson, Winnipeg, Saskatchewan, Burntwood and Laurie rivers.

- Protects customer service by providing the highest level of system reliability and energy security;
- Supports risk management and flexibility to respond to changing conditions such as higher or lower load growth, uncertainty in level of future demand side management (DSM), changes in river flows due to climate change and additional export market opportunities;
- Provides the highest financial benefit and offers the highest socio-economic benefits (including employment and provincial economic growth) to Manitobans;
- Provides the most beneficial package of socio-economic impacts and benefits to northern and aboriginal communities through training, employment, business opportunities, income sharing and participation in environmental and socio-economic protection;
- Capitalizes on Manitoba's valuable endowment of renewable hydropower rather than imported non-renewable resources;
- Supports Manitoba's Clean Energy Strategy and sustainable development principles by providing clean renewable energy and a legacy for future generations.

The plan incorporates different pathways to allow for future flexibility in adjusting the plan based on changing conditions. A pathway consists of:

- A choice to embark upon an initial development plan today;
- A sequence of decision points that will occur in the future as information modifies or eliminates current uncertainties, such as price forecasts for natural gas and exports and approvals of new interconnections;
- Examples of alternative plans or changes to the initial plan that can be chosen to respond to emerging realities.

A pathway represents the initial decision to commit to one development plan at the outset but not an obligation to rigidly see that plan through regardless of circumstances. Load growth, Power Smart plans, export contracts, natural gas price forecasts, export price forecasts, greenhouse gas restrictions, capital cost estimates, interest rates and other parameters will be continually monitored and reviewed.

Decisions for future power generation and transmission and distribution system development will depend on the best information available at that time. If circumstances warrant, the plan will be modified at key decision points.

Natural gas

From a provincial perspective, the demand for natural gas in Manitoba is forecast to be relatively flat over the next ten years (from 2013) despite expected annual increases in the province's population. Increases in natural gas demand due to population growth are mainly offset by the energy savings achieved through investments in newer energy efficiency technologies and a trend of reduced use of natural gas water heating systems. However, some geographic areas within Manitoba are experiencing accelerated growth in natural gas demand where pipeline capacity and infrastructure must now be increased.

Natural gas plays a significant role in meeting Manitoba's energy needs – the demand for natural gas currently served by Manitoba Hydro's gas distribution system is the equivalent of approximately 1.4 times the size of the total hydro-electric generating system if expressed in equivalent energy terms.

During the next few years, Manitoba Hydro will be devoting a significant amount of effort in response to major changes in the North American supply and transportation markets driven by the challenges faced by TransCanada Pipelines and by recent regulatory orders by the National Energy Board. For the past decade, Canada's dominant inter-provincial pipeline has experienced growing economic challenges as a result of declining gas shipments; this has led to dramatically escalating tolls to ship natural gas. Changes in geographic gas production and shipment patterns also require changes to gas distribution operations in order to preserve a reliable flow of gas to customers.

Similar to the electric side of the business, the natural gas distribution system is aging. A more rigorous approach to preserve the integrity of our pipeline assets and continued emphasis on public safety amplifies our commitment to develop comprehensive asset replacement programs. Our goal is to address these infrastructure requirements in order to continue to acquire and deliver natural gas to our customers in a safe, reliable and cost effective manner.

Left: Field worker from Gas Apparatus Maintenance and Control operates a valve at the gate station which supplies natural gas to the Selkirk Generating Station.

Natural gas (continued from page 6)

To meet our customers' future demand for natural gas, Manitoba Hydro's plan includes:

- Aggressively pursuing energy efficiency opportunities (> 100 million cubic metres of planned cumulative savings in gas demand);
- Educating customers on fuel choice alternatives as natural gas currently offers customers a more economic alternative in meeting their heating needs and results in economic benefits for Manitoba Hydro, the province and reduces global greenhouse gas emissions;
- Conducting a natural gas asset condition review, developing a long-term capital plan and re-investing in the existing natural gas system to manage capacity constraints and preserve gas system reliability;
- Studying and assessing possible future natural gas storage and transportation alternatives, including the potential to serve Manitoba from nearby production basins in North Dakota should the necessary pipeline infrastructure be developed;
- Monitoring and evaluating the potential for natural gas storage and/or production to be developed within the province.

Above and near left: Upgrading a gas service, including relocating and welding of gas lines by the Gas Distribution Maintenance Department.

Far left: As part of the CentrePort Canada project, installation of approximately three-and-a-half kilometers of 16-inch natural gas transmission pipeline around the new intersection was needed to accommodate the new traffic overpass at Saskatchewan Avenue and the Perimeter Highway.

Trends and factors influencing the North American energy markets

Customer service expectations

As we deliver electricity and natural gas to customers, we recognize that these are simply inputs to necessities such as heat and light. Due to society's increasing dependency on technology, service and reliability expectations of all customers have increased dramatically over the past decade. The level of service provided by the utilities sector will be expected to keep pace with the integration of technology into our daily lives and the need for instant access to information.

Industrial and commercial customers operating in an increasingly competitive global economy expect utilities to meet their needs with respect to service timelines, rates, power quality and reliability. Obtaining energy service in a timely manner at competitive rates is critical to their business models in order to remain strong competitive entities, while providing Manitoba Hydro with important domestic revenue and contributing to the broader Manitoba economy.

Economic factors

The North American economy continues a trend of slow economic growth. The province of Manitoba is growing, both in population and the broader economy. While Power Smart programs have been and will continue to be promoted to reduce customer energy usage, domestic energy demand is expected to grow in all sectors.

Historically low interest rates are beneficial in a period of capital investment and expansion. Financial markets will be continually monitored as Manitoba Hydro takes on new debt to mitigate risk and maintain financial strength. Over the longer term, interest rates are expected to rebound with the growth in the economy.

Above: Extreme and fluctuating weather conditions such as ice storms can cause ice to form on power lines. Crews use a technique called "ice-rolling" to remove the ice from power lines as quickly as possible to prevent equipment breakage and loss of power. Rollers attached to the end of long poles are pulled along the power lines cracking the ice off as they go.

Trends and factors influencing the North American energy markets

Composition of energy supply

The need for new generation in the United States and Canada is expected to be driven by modest load growth and the replacement of a portion of the aging generation fleet. Electricity demand in both Canada and the United States will continue to increase over the resource planning horizon, with the majority of this growth driven by increased residential and commercial consumption.

Energy and environmental considerations and policies are and will continue to be major factors influencing resource choices and market price for electricity. Global interest and attention to environmental issues and the effects of climate change could have profound impact on the energy industry and provide an opportunity for Manitoba Hydro.

Renewable Portfolio Standards (RPS) exist in many states to encourage the development of renewable electricity generation. These policies require a certain proportion of energy served to be delivered from eligible renewable sources. To the extent that these types of programs include Canadian hydropower as an eligible resource, they would provide an additional incentive to buy electricity from Manitoba.

Recent developments in oil and gas extraction technologies have significantly increased the availability of these resources. The growth of shale gas production has resulted in an abundant new United States energy supply source. When combined with the economic slowdown, these factors have changed the long-term outlook for North American domestic natural gas prices and may impact both customer and utility options. While many utilities will choose to develop natural gas generation, they are likely to continue to seek out emission-free alternatives in order to diversify their portfolio of resources, mitigate expected natural gas price uncertainty and volatility, protect against future carbon price liabilities, and improve environmental performance.

Left: The Nelson River featuring Long Spruce Generating Station with Kettle Generating Station in the background.

Operational excellence describes how Manitoba Hydro intends to meet its mandate. Key areas of focus provide clarity around our priorities and ensure that Manitoba Hydro is positioned for success.

Top priorities include:

- Safety
- Financial strength
- Customer value
- Aboriginal relations
- Workforce management
- Protecting the environment
- Demand side management (DSM)

Corporate dashboard

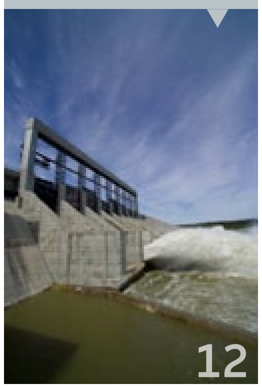
Critical success factors, including corporate targets, are captured in the Corporate dashboard.

Corporate Dashboard

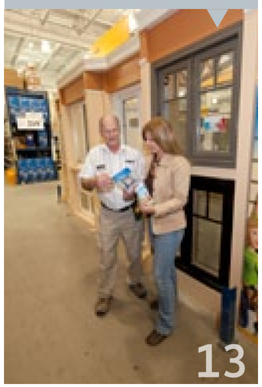
	Critical success factors	Target
Safety in the workplace	Accident severity rate	< 12 days per 200,000 hours worked
	Accident frequency rate	< .60 accidents per 200,000 hours worked
	High risk incidents	0 incidents
Financial strength	Net income (Loss) ($ thousands)	As per budget
	OM&A costs (consolidated) ($ thousands)	As per budget
	Capital expenditures – base	As per budget
	Capital expenditures – major projects	As per budget
Customer value	System average interruption duration (SAIDI)	< 116 minutes
	System average interruption frequency (SAIFI)	< 1.4 per year
	Customer satisfaction (CSTS)	> 8.4/10 customer satisfaction with overall service
Aboriginal relations	Aboriginal employment	16% overall
Protecting the environment	Progress towards environmental targets	Achieve all 3 targets
Demand side management	Electric energy saved	174 GWh annual incremental savings
	Electric capacity saved	201 MW annual incremental savings
	Natural gas energy saved	10 million cubic meters

Safety

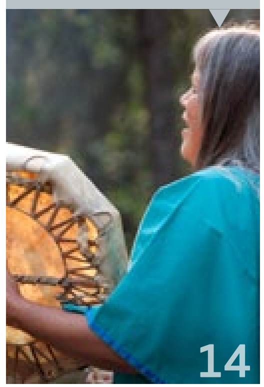
Financial strength



Customer value



Aboriginal relations



Workforce management

Protecting the environment

Demand side management

Safety

Promoting safety in the workplace and in the actions of the public around our facilities remains a top priority and is Manitoba Hydro's most important goal. Manitoba Hydro is committed to continuously improving its safety performance and focusing on strategies to instill a safety and health culture in all corporate activities. In doing so, we intend to maintain a steady decline in both workplace accident severity and frequency rates.

Key areas of focus

- Create a consistent corporate 'Safety First' message targeted at preventing all incidents;
- Reinforce management, supervisory and worker accountability for a safe and healthy workplace;
- Redesign the Safety Training for Leaders program to meet the needs of both informal and formal leaders;
- Integrate risk assessment into all safety-related training programs;
- Provide employees with safety and wellness information and services;
- Mentor all employees to be qualified and well practiced in the use of safe work procedures;
- Deliver effective public education and safety programs to minimize public contacts.

Above: Manitoba Hydro promotes public safety in schools with a range of educational materials and programs.

Left: Job site planning meetings (frequently referred to as a "tailboard" meeting) are meetings held at the job site with all workers involved. They are held before the work begins and as required during the course of the work to ensure that all workers understand the hazards, risks, and procedures associated with the job.

Financial strength

Maintaining financial strength is essential in order to make the necessary investments in infrastructure to continue to provide safe and reliable service to customers, financially withstand the risks and uncertainties that are inherent in our operations and to provide customers with long-term rate stability and predictability and avoid the need for large or sudden rate increases in the future. While the required investment in new and existing infrastructure is expected to place a certain degree of pressure on the Corporation's key financial targets, Manitoba Hydro is currently well positioned to make these investments and is committed to carefully managing its costs and balancing the need for reasonable rate increases with sensitivity to customer rate impacts and in doing so, maintain competitive rates for our customers.

Above: The spillway at Kettle Generating Station located on the Nelson River.

Key areas of focus

- Utilize resources efficiently and effectively to fulfill our mandate and provide maximum value to our stakeholders and ratepayers;
- Critically review all capital project proposals to ensure best value;
- Diligently manage capital projects to be on time and on budget, leveraging experience from past projects to improve upon capital cost estimating, and project and contract management;
- Aggressively pursue a balanced portfolio of domestic and profitable export sales to provide the highest financial benefits to ratepayers and all Manitobans over the long term;
- Fully justify and obtain Public Utilities Board approval for rate increases that will be necessary to achieve financial targets over the long term;
- Closely monitor economic factors, financial markets and energy markets to manage and mitigate financial risk.

Financial targets

The Manitoba Hydro-Electric Board approves financial targets to be considered in all major corporate decisions. These include:

- *Debt: Equity ratio 75:25*
- *Interest coverage ratio > 1.2*
- *Capital coverage ratio > 1.2 excluding major new generation and transmission*

Customer value

Providing excellent customer service, high system reliability* and affordable rates are fundamental in everything we do. We are a leader in promoting conservation, providing numerous Power Smart programs to assist customers in meeting their energy needs.

Key areas of focus

- "Keep the lights on and the gas flowing" with safe and reliable delivery of electricity and natural gas to customers through investment in existing infrastructure and system expansion;
- Assist customers in finding sustainable energy solutions to meet their needs, including fuel choice and energy efficient opportunities and thereby reducing their overall energy bills and impact on the environment;
- Provide predictable, fair and affordable rates for all Manitobans;
- Construct Bipole III to strengthen reliability of the electric system and provide energy security;
- Maintain compliance with applicable North American Electric Reliability Corporation (NERC) reliability standards and foster a culture of reliability excellence.

** Reliability performance is measured as the System Average Interruption Duration (SAIDI) and System Average Interruption Frequency (SAIFI). Our target is to remain in the top quartile when compared to other Canadian Utilities.*

Above: Promoting energy efficient windows.

Left: Downtown Winnipeg at night.

Aboriginal relations

Engaging impacted Aboriginal communities in a positive way is vital to enhance working relationships.

Key areas of focus

- Address the adverse effects of our operations on Aboriginal communities;
- Continue to be a leading Canadian utility in Aboriginal representation through initiatives to recruit, develop and retain Aboriginal employees;
- Develop and maintain business relationships with Aboriginal businesses;
- Foster an appreciation of Aboriginal cultures in the workplace;
- Provide opportunities for Aboriginal participation in future development projects.

Above: A ceremony was held at Wuskwatim Cultural Centre to mark the river diversion.

Left: Gary Spence (Utility Worker) and Mark Sweeny (Manager), both of the Community Relations Department, and both members of the Cross Lake First Nation, conduct a shoreline inspection on Sipiwesk Lake.

Workforce management

Attracting, developing and retaining a highly skilled and motivated workforce that reflects the demographics of Manitoba is critical to our success.

Key areas of focus

- Provide employee development programs to enhance employee technical, leadership and business skills;
- Maintain workplace diversity and inclusiveness programs;
- Align workforce planning with corporate priorities;
- Maintain leadership and technical continuity through effective succession planning;
- Promote Manitoba Hydro as an employer* of choice.

** Manitoba Hydro continues to be one of the best places to work in Canada. For the fourth consecutive year, the corporation is part of the Canada's Top 100 Employers list.*

As an employer of choice, Manitoba Hydro has been recognized as having among the best:

- *Physical workplace;*
- *Work atmosphere;*
- *Health, financial and family benefits;*
- *Vacation and time-off;*
- *Employee communications;*
- *Performance management;*
- *Training and skills development;*
- *Community involvement.*

Left: Employees participate in the 8th Habit course on leadership at 360 Portage Avenue.

Protecting the environment

Protecting the environment is an integral part of everything we do. We accomplish this by integrating environmentally responsible practices in all aspects of our business. Environmental protection is carried out with dedication to monitoring programs, climate change initiatives, and environmental research and development.

Key areas of focus

- Maintain and improve Manitoba Hydro's Environmental Management System (EMS) to conform with the ISO 14001 standard;
- Reinforce a culture of environmental awareness and the interaction between the corporation's activities and the environment;
- Participate in the development of evolving environmental regulations and climate change policies;
- Enhance public understanding of how Manitoba Hydro's hydroelectricity exports displace greenhouse gas emissions in other regions;
- Expand green procurement, green fleet and other potential opportunities;
- Plan and implement our projects to avoid or mitigate impacts on the environment;
- Conduct and support environmental research, monitoring and educational programs relevant to sustainable development and Manitoba Hydro's operations.

Above: Collaring caribou as part of the environmental assessment studies for Bipole III transmission line to understand the relationship between caribou, wolves and transmission lines.

Far left: Fall image of frosty plants near Wuskwatim Generating Station.

Near left: Nelson River Sturgeon Board employees from Split Lake First Nation and Thicket Portage collect data in support of research to help increase Manitoba's sturgeon population.

Demand side management

As the province's population and economy continues to grow, demand side management (DSM) plays a key role in meeting Manitoba's future energy needs in a sustainable manner. These efforts assist customers in using energy more efficiently and result in overall lower energy bills.

Key areas of focus

- Develop, implement and promote Power Smart programs that aggressively pursue all economic energy efficiency opportunities for both electric and natural gas customers;
- Capture energy efficiency improvements through the advancement of codes and standards, service extension policies and rate structures;
- Promote the optimum use of electricity, natural gas and alternative renewable energy options in Manitoba;
- Assess customer load displacement options.

What is DSM?

DSM represents the actions taken to influence a customer to modify their pattern of energy usage. DSM focuses on how customers use energy to meet Manitoba's future energy needs. While energy efficiency is the largest component for Manitoba Hydro, DSM is broader in scope and pursues opportunities including:

- *conserving energy;*
- *the timing and level of energy consumption; and*
- *using the appropriate energy source based on the application (gas, electric, or other renewable resource).*

Top: The Brandon University's Healthy Living Centre was constructed to meet Power Smart design standards. The centre features a fitness area, two gymnasiums, a walking track and a sports medicine centre. In the fitness area, several state of the art machines operate only on user-generated energy, not from Manitoba Hydro.

Above: Promotion of commercial Power Smart programs.

Manitoba Hydro corporate dashboard

	Measure	Target
Safety	Accident severity rate	< 12 days per 200,000 hours worked
	Accident frequency rate	< 0.60 accidents per 200,000 hours worked
	Serious incidents	0 incidents
Financial strength	Net income (loss) ($ thousands)	As per budget

	Capital expenditures – electric operations – major new generation & transmission ($ thousands)	As per budget
	Capital expenditures – electric & gas operations – major & base capital ($ thousands)	As per budget
Customer value	System average interruption duration (SAIDI)	< 116 minutes
	System average interruption frequency (SAIFI)	< 1.4 per year
	Natural gas system reliability	99.99999964%
	Average unplanned natural gas outage duration	< 4.39 hours
	Number of customers affected by unplanned natural gas outages	< 177 customers
	Customer satisfaction (CSTS – Manitoba Hydro quarterly survey)	> 8.4/10 customer satisfaction
Aboriginal relations	Aboriginal employment	16% overall
Protecting the environment	Progress towards environmental targets*	Achieve all 3 targets
Demand side management	Electric energy saved	363 GWh
	Electric capacity saved	243 MW
	Natural gas energy saved	10 million cubic meters

** Environmental sub-targets:*

a. *Percentage of electricity generated in Manitoba from renewable resources* — *Target: ≥ 99%*
b. *Total annual GHG emissions* — *Target: ≤ 520 kt*
c. *Repeat environmental audit findings* — *Target: 0 repeat findings*

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

CORPORATE ORGANIZATIONAL STRUCTURE

Manitoba Hydro’s organizational structure consists of 10 Business Units. A brief description of the role of each Business Unit is provided below. A diagram of Manitoba Hydro’s Organizational structure is provided in Figure 1 of this Appendix.

Corporate Group

The Corporate Group includes the Office of the President & Chief Executive Officer and the Public Affairs Division. The President & Chief Executive Officer leads the Corporation, establishes Corporate policies and practices, and ensures the fulfillment of the Corporation's mandate, mission, and goals. The Public Affairs Division provides specialized communication services geared towards a variety of Corporate-wide projects and issues. The Division produces a wide range of publications for various stakeholders, delivers public open houses, and acts as the official spokespeople for the Corporation.

General Counsel & Corporate Secretary Business Unit

The General Counsel & Corporate Secretary Business Unit provides legal, internal audit, insurance and intellectual property services. The Business Unit consists of the Law Division, the Internal Audit Division, the Insurance Services Department, the Human Rights & Respectful Workplace Advisor, the Compliance Officer and the Intellectual Property Officer.

Corporate Relations Business Unit

The Corporate Relations Business Unit is responsible for building and maintaining relationships with Aboriginal communities, the Provincial government and across Business Units. The Business Unit brings together several planning, analysis, forecasting and coordinating functions to perform corporate level examinations of subjects or issues that are strategically significant to Manitoba Hydro. The Business Unit consists of the Aboriginal Relations Division, the Corporate Planning & Strategic Review Division, and the Government Relations & Current Issues Department.

Finance & Regulatory Business Unit

The Finance & Regulatory Business Unit promotes fiscal responsibility throughout the corporation and provides professional services to other Business Units and external stakeholders. This Business Unit provides a number of services including management and financial accounting, budgeting and financial forecasting, controllership, development of rates and policies, financial market, debt and investment, cash management, and corporate banking services. The Business Unit is also responsible for corporate risk management, recommending and monitoring the Corporation's financial targets, external financial reporting, and supporting and providing policy guidance to other Business Units, and subsidiaries of the Corporation. The Finance & Regulatory Business Unit consists of the Corporate Controller Division, the Rates & Regulatory Affairs Division, the Treasury Division, the Corporate Risk Management Department, the Financial Planning Department and Subsidiary Operations.

Generation Operations Business Unit

Generation Operations provides for the current and future supply of electricity to Manitobans, as well as marketing and selling electricity to export customers in both Canada and the US**.** This Business Unit plans, designs, operates and maintains 15 hydraulic generating stations, 2 thermal generating stations, and a number of water control structures. Generation Operations is also responsible for optimizing the use of its facilities within the interconnected, international electricity market to achieve the lowest reasonable cost to Manitoba electricity customers, while giving due regard to the environment, safety, and reliability. The Business Unit consists of the Engineering Services Division, the Generation North Division, the Generation South Division, the Power Planning Division, and the Power Sales & Operations Division.

Major Capital Projects Business Unit

The Major Capital Projects Business Unit is responsible for managing the licensing, design, procurement, construction, commissioning, and labour relations associated with major projects, including the Keeyask Generating Station, the Bipole III converter stations and transmission line, and the Pointe du Bois spillway reconstruction. The Business Unit consists of the Bipole III Project Division, the New Generation Construction Division, the Licensing & Relationship Management Division, and the Portfolio Projects Management Division.

Transmission Business Unit

The Transmission Business Unit plans, designs, constructs, operates, and maintains transmission facilities throughout the province and provides licensing and environmental assessment services, and detailed system planning analysis. In addition, the Business Unit is responsible for HVDC systems, and for the installation and maintenance of electrical apparatus in stations. Moreover, the Business Unit is responsible for real-time operation and reliability of the power grid and provides transmission services to third party open-access transmission customers. The Transmission Business Unit consists of the Apparatus Maintenance Division, the HVDC Division, the Transmission Construction & Line Maintenance Division, the Transmission Planning & Design Division, and the Transmission System Operations Division.

Customer Service & Distribution Business Unit

The Customer Service & Distribution Business Unit (CS&D) provides Manitoba customers with safe, reliable, economical, and innovative energy products and services through the engineering, construction, operation and maintenance of Manitoba Hydro's natural gas and electrical distribution network (66kV and below). The Business Unit plans for the long-term necessary capacity to accommodate customer growth. Moreover, the Business Unit improves the distribution system through asset replacements and system upgrades. The Business Unit consists of the Customer Service Operations South Division, the Customer Service Operations Winnipeg & North Division, the Distribution Engineering & Construction Division, and Business Support & Capital Asset Management Division.

Customer Care & Energy Conservation Business Unit

The Customer Care & Energy Conservation Business Unit provides energy services and support to meet the needs of customers within Manitoba, captures Demand Side Management opportunities, and secures the natural gas needs of the province. This Business Unit is the primary contact between Manitoba Hydro and its domestic customers. The Customer Care & Energy Conservation Business Unit includes the Business Communications Department, the Business Support Services Division, the Consumer Marketing and Sales Division, the Gas Supply Division, the Industrial & Commercial Solutions Division, the Power Smart Planning, Evaluation, & Research Department, and the Affordable Energy Department.

Human Resources & Corporate Services Business Unit

The Human Resources & Corporate Services Business Unit provides services in the areas of human resources, information technology (IT), workplace health and safety, and environmental management. The Business Unit consists of the Human Resources Division, the IT Division, the Workplace Safety & Health Division, the Corporate Services Division, and the Corporate Environmental Management Department.

MANITOBA HYDRO

2015/16 & 2016/17 GENERAL RATE APPLICATION

INTEGRATED FINANCIAL FORECAST & ECONOMIC OUTLOOK

INDEX

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

INTEGRATED FINANCIAL FORECAST & ECONOMIC OUTLOOK

3.0 OVERVIEW

Tab 3 provides an overview of Manitoba Hydro's Integrated Financial Forecast, Economic Outlook, and Debt Management Strategy. Section 3.1 discusses the 2014 Economic Outlook, Sections 3.2 and 3.3 discuss Manitoba Hydro's 2014 Integrated Financial Forecast (IFF14) and Electric operations forecast (MH14), Section 3.4 discusses Manitoba Hydro's 20 year Financial Outlook and Financial Targets, Section 3.5 discusses Manitoba Hydro's Debt Management Strategy, and Section 3.6 discusses Credit Rating Agency Reports.

The key conclusions with respect to Tab 3 are:

1. The required investments in new and existing infrastructure that are necessary to continue to provide a high level of service to customers are expected to double the asset base and carrying costs of Electric operations in the next 10 years.

2. While a portion of the required investments will be funded by cash flow from operations, the majority will be funded through unprecedented levels of debt financing.

3. Rate stability for customers is dependent on Manitoba Hydro maintaining its financial strength.

4. The required investment in assets will place pressure on Manitoba Hydro's financial strength by deteriorating the financial results and key financial ratios.

5. While Manitoba Hydro is prepared to accept deterioration of its financial ratios in order to mitigate rate increases for customers, the proposed 3.95% rate increases are the minimum that are required to maintain rate stability and

manage the deterioration in the Corporation's financial strength during the period of extensive investments.

6. The proposed 3.95% rate increases will maintain Manitoba Hydro's 2015/16 and 2016/17 net income and financial ratios at acceptable levels and will compensate for lower net extraprovincial revenues that are currently being experienced.

7. The proposed 3.95% rate increases are required notwithstanding more favourable near-term financial results, given Manitoba Hydro's near-term exposure to changes in water flow conditions and the mid-term outlook for less favourable financial results.

8. Inflationary rate increases are not sufficient to maintain rate stability for customers, and will subject customers to increased rate volatility in the future.

9. The key financial risks associated with rate increases lower than 3.95% are:
    i. Increased risk to customers of rate instability and rate shock;
    ii. Increased borrowing requirements and associated financing costs which must be recovered from customers in the future;
    iii. Potential negative implications to the Provincial credit rating and Manitoba Hydro's borrowing costs.

3.1 ECONOMIC OUTLOOK 2014

The Economic Outlook is prepared at the start of the annual forecasting cycle at Manitoba Hydro. The forecasts reported in the Economic Outlook are based on a consensus view of several independent sources including Canada's primary financial institutions in addition to several other independent sources, all of which are well known and respected. The most recent forecasts from each of the sources at the end of March 2014 were used in the spring Economic Outlook. The Economic Outlook provides a forecast of economic and financial variables that are used in business analyses throughout the Corporation and are inputs in other forecasts. Variables such as real gross domestic product and residential customer projections are inputs to the Load Forecast; and, interest, escalation and exchange rates are used in a number of component forecasts that are inputs to the IFF. The 2014 Economic Outlook is provided in Appendix 3.1.

With the weakened outlook for global growth, future forecasts for both interest rates and the Canadian dollar were updated in the fall of 2014, with source forecasts available as of the end of September 2014. Also provided in Appendix 3.1 is an update to Appendix A of the 2014 Economic Outlook to reflect the latest consensus of source forecasts as of September 2014.

As a result of the fall update, the values of certain variables that were used in the IFF have been updated from those in the 2014 Economic Outlook. The economic variables that were revised in the fall update and incorporated into IFF14 are as follows:

Figure 3.1 Updated Economic Variables

	Short-term Interest Rate*	Long-term Interest Rate*	USD/CAD
2014/15	1.95	4.50	1.10**
2015/16	2.30	5.10	1.12
2016/17	3.40	5.50	1.12

*Short-term and long-term interest rates include the provincial guarantee fee
** USD/CAD exchange rate marked with an asterisk was reviewed, but not changed from the spring 2014 Economic Outlook for 2014/15.

Appendix 3.2 provides additional information with respect to the determination of Manitoba Hydro's interest rate forecast.

3.2 INTEGRATED FINANCIAL FORECAST

The Integrated Financial Forecast ("IFF") is Manitoba Hydro's primary planning document for projecting the future financial direction of the Corporation. IFF14 sets forth the projected financial results and financial position of Manitoba Hydro for the 20-year period to 2033/34. Its purpose is to provide an indication of the Corporation's long-term financial direction. The IFF serves as the primary forecast to determine the need for rate increases and the detailed forecasts in years two and three of the IFF form the basis of the revenue requirement portion of the Corporation's electric rate application.

The IFF is based on various component forecasts from across the Corporation including the:

– Economic Outlook
– Energy Price Outlook

- Electricity Export Price Forecast
- Power Smart Plan
- Electric Load Forecast
- Domestic Revenue Forecast
- Power Resource Plan
- Generation Cost & Interchange Revenue Forecast
- Capital Expenditure Forecast
- Operating, Maintenance & Administrative Expense Forecast

IFF14 can be found in Appendix 3.3 and was approved by the Manitoba Hydro-Electric Board (“MHEB”) on December 3, 2014. IFF14 includes segment forecasts for electric operations (MH14), natural gas operations (CGM14), and corporate subsidiaries (CS14).

3.3 ELECTRIC OPERATIONS FORECAST (MH14)

The MH14 forecast contains the projected financial results for electric operations and can be found in Appendix 3.4. Manitoba Hydro’s financial targets have been set for consolidated operations. As requested in past proceedings, Manitoba Hydro has also provided financial ratio calculations for electric operations in Appendix 3.4. Given the dominate size of electric operations in relation to consolidated operations, these calculations usually differ only slightly from consolidated ratio calculations.

In this Application, 2015/16 and 2016/17 are the two years for which rate increases are sought. Manitoba Hydro is also seeking final approval of the 2.75% rate increase granted effective May 1, 2014 in Order 49/14. The forecast period for MH14 extends for 20 years, in order to provide an indication of the longer-term financial outlook for electric operations. For the purposes of the requested rate increases, the focus of this Application is centered on the three year period under review in this proceeding (2014/15 to 2016/17) and the first 10 years of MH14 (2014/15 to 2023/24). This follows the Manitoba Hydro approach of determining near-term rate proposals in the context of the 10 year financial outlook and the financial challenges in this period that result from the extensive investment requirements.

The rate increases proposed for 2015/16 and 2016/17 have been approved by the MHEB for submission to the PUB. The indicative rate increases subsequent to 2016/17 may be changed in future forecasts and are presented for illustrative purposes only. Each year’s revision to the Integrated Financial Forecast is based on the current year's assumptions including energy supply and demand, projected interest and escalation rates, projected prices for exported energy, operating and capital forecasts and other factors. Actual rate applications made in future years will depend upon the circumstances and outlook at that time and will be subject to the review and approval of the MHEB.

3.3.1 10 Year Electric Operations Financial Outlook

Figure 3.2 below summarizes the changes in net income between MH14 and MH13 (2013 forecast for electric operations). In comparison to MH13, Electric operations net income including the proposed and indicative rate increases is projected to be approximately $0.5 billion lower over the 10-year period to 2023/24.

Figure 3.2 - Comparison of Electrical Operations MH14 to MH13
Increase/(Decrease)
(millions of $)

	2015-2017			2015-2024		
	MH14	MH13	Variance	MH14	MH13	Variance
General Consumers at projected rates	4 430	4 550	(119)	17 755	18 460	(705)
Extraprovincial	1 293	1 134	159	6 449	5 892	557
Other	43	40	3	149	158	(9)
Total Revenues	5 766	5 724	43	24 353	24 495	(142)
Operating and Administrative	1 579	1 584	(5)	5 751	5 821	(71)
Finance Expense	1 553	1 579	(26)	8 975	8 564	411
Depreciation and Amortization	1 228	1 325	(97)	5 486	5 451	36
Water Rentals and Assessments	359	345	14	1 213	1 186	28
Fuel and Power Purchased	456	504	(49)	2 091	2 209	(118)
Capital and Other Taxes	327	331	(4)	1 355	1 350	5
Corporate Allocation	25	27	(1)	83	88	(5)
Other Expenses	7	0	7	25	0	25
	5 534	5 695	(161)	24 980	24 668	311
Non-controlling Interest	45	57	(12)	68	88	(21)
Net Income	277	86	191	(559)	(85)	(474)

The decrease in General Consumers Revenue in the first ten years of MH14 is primarily due to increased energy and capacity savings as a result of more aggressive Residential and Commercial incentive based DSM programs, alternative approaches to the market, and additional new energy efficiency programs.

The increase in Extraprovincial Revenue in the first ten years of MH14 is primarily due to a projected weakening of the Canadian dollar compared to MH13, as well as increased DSM energy and capacity savings, which increase export sales. These increases in Extraprovincial Revenue are partially offset by lower projected export prices compared to MH13.

The decrease in OM&A in the first ten years of MH14 is mainly due to the reclassification of Great Northern Transmission Line costs to fuel and power purchases, as well as the nine month deferral of Bipole III Reliability Project.

The increase in Finance Expense in the first ten years of MH14 is primarily due to an increase in interest expense associated the revised capital spending for the Bipole III Reliability Project and the Keeyask Generating Station when these projects are placed into service and the interest is no longer capitalized. This increase is partially offset by lower projected interest rates compared to MH13.

The increase in Depreciation and Amortization Expense in the first ten years of MH14 is primarily due to the revised capital spending noted above, and is almost fully offset by the reduction in depreciation rates as a result of the 2014 Depreciation Study and changes to depreciation methodologies.

The decrease in Fuel and Power Purchased in the first ten years of MH14 is primarily a result of the following: a reduction in import purchases and thermal generation requirements due to increased DSM energy and capacity savings, lower import and fuel prices, and lower transmission charges. Decreases in Fuel & Power Purchased are partially offset by a projected weakening of the Canadian dollar compared to MH13.

Tab 5 of the Application provides detailed explanations of the actual and forecast revenues and expense related to Electric operations for 2012/13 to 2016/17.

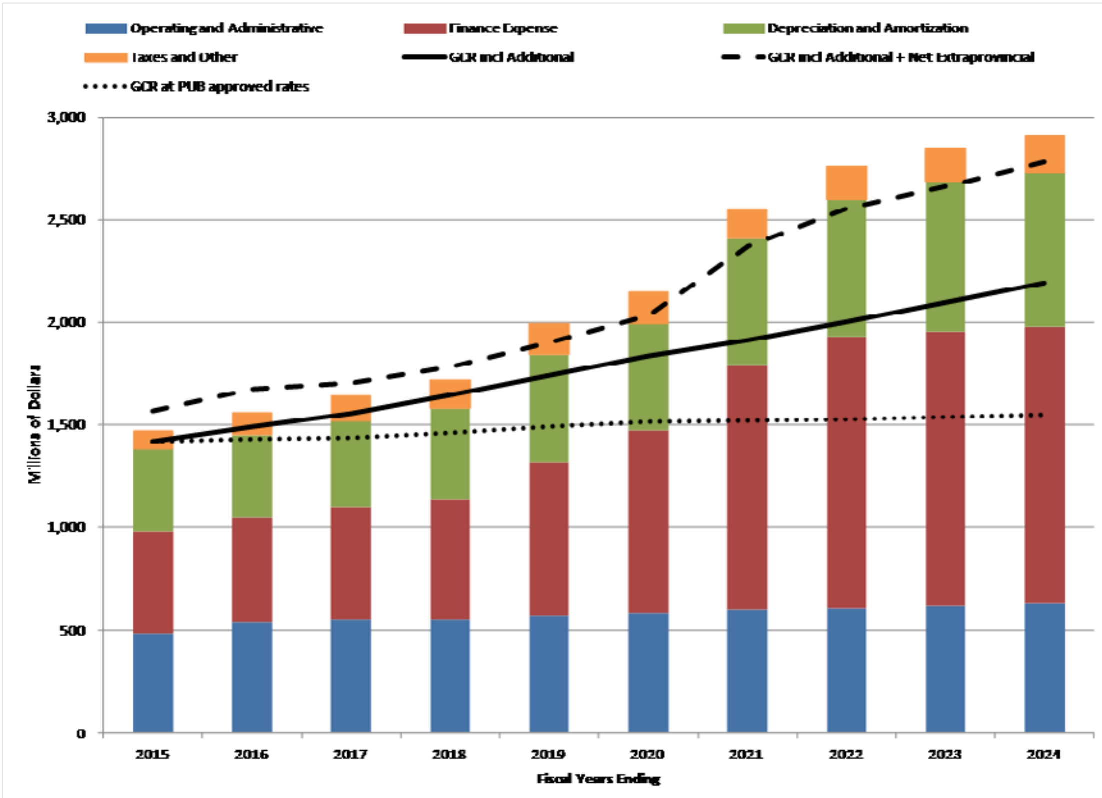
3.3.2 10 Year Comparison of Expenses Versus Revenues—Electric Operations

The following Figure 3.3 compares Manitoba Hydro’s electric operations projected non-flow related expenses (OM&A, finance expense, depreciation expense, and taxes and other expenses), which are more fixed in nature, to the Corporation’s projected domestic and net export revenues (extraprovincial revenues less fuel & power purchases and water rentals & assessments). Manitoba Hydro's costs rise sharply to approximately $3.0 billion over the 10 year period to 2023/24, essentially doubling from their current level of $1.5 billion. This increase in costs is primarily driven by Manitoba Hydro's required capital investments.

General Consumers Revenue is insufficient to fully cover the $1.5 billion total cost increase. Over the 10 year period, General Consumers Revenue, including the proposed and projected indicative annual rate increases, rises by only about half the cost increase ($0.7 billion and $1.5 billion respectively). Even with net extraprovincial revenues, Manitoba Hydro is projecting losses on electric operations in 2018/19 to 2023/24 totaling approximately $0.9 billion, which reduces projected retained earnings from approximately $2.7 billion in 2014/15 to $2.0 billion by 2023/24.

Manitoba Hydro is relaxing its adherence to financial targets over this period in order to alleviate rate increases in excess of 3.95% to the extent possible. Due to the deterioration in Manitoba Hydro's financial ratios (discussed in Section 3.4), any further increases to costs or reductions to revenues increases the risk of significantly higher rate increases to customers.

Figure 3.3 Electric Expenses Compared to Revenues



In the next 10 years there is significant financial risk and potential for rate volatility as Manitoba Hydro's financial position deteriorates due to the large capital investment requirements. In the longer term, the indicative 3.95% rate increases and the additional export revenues from Keeyask are forecast to accumulate to a sufficient level to cover the increased costs and Manitoba Hydro is projected to begin to rebuild its financial reserves.

3.3.3 Sensitivity Analysis

Manitoba Hydro's earnings and financial reserves are highly sensitive to fluctuations in water flows, interest rates, export prices, and domestic rates changes. The Sensitivity Analysis discussion on pages 22-25 in Appendix 3.3 and provided in Appendix 3.6 show the following impacts to retained earnings associated with changes to these assumptions (assuming there are no compensating changes to the projected rate increases reflected in MH14):

- A 5 year drought would result in a significant detrimental impact to Manitoba Hydro's financial stability causing a decrease in retained earnings of $1.7 billion by 2020/21 (the end of the 5 year drought period).

- A change in interest rates by +/- 1% would cause retained earnings to change by approximately +/- $1 billion by 2023/24.
- A low or high export price change would cause retained earnings to change by approximately +/- $700 million by 2023/24.

Although MH14 shows a strengthening of earnings in the first four years of the forecast to 2017/18, Manitoba Hydro's projected financial results and ratios (discussed in detail in Section 3.4) show a projected decline over this period and continuing through to the in-service of the Keeyask Generating Station. It is imperative for Manitoba Hydro to be granted the proposed rate increases, as well as regular and reasonable rate increases over the long term to maintain Manitoba Hydro's financial integrity and self-sufficiency, ensure rate stability for its customers, to maintain its infrastructure and to accommodate capital development to provide adequate supply, transmission and distribution into the future.

By receiving regular and reasonable rate increases, as forecast in MH14, Manitoba Hydro will continue to effectively manage the growing electricity requirements of the Province, strive to maintain system reliability and the financial strength of the Corporation on behalf of its customer base.

3.4 20 YEAR FINANCIAL OUTLOOK & FINANCIAL TARGETS

Over the 20-year period to 2033/34, electric operations net income in MH14 is projected to be approximately $1.8 billion lower than MH13. General Consumers Revenue is $3.3 billion lower compared to MH13 mainly due to increased demand side management savings, a lower approved rate increase for 2014/15 and lower projected indicative rate increases from 2031/32 to 2033/34. Over the 20 year forecast period, net extraprovincial revenues are projected to be $2.0 billion lower compared to MH13 mainly due to the suspension of Conawapa, as well as lower projected export prices, partially offset by increased energy available for export as a result of increased demand side management (DSM) energy and capacity savings.

The reduction in General Consumers Revenue and extraprovincial revenues is partially offset by reductions in finance expense ($2.6 billion), capital and other taxes ($0.4 billion), and depreciation expense ($0.2 billion) compared to MH13 that result from lower projected interest and depreciation rates and projected capital expenditures that are

$7.5 billion lower over the 20 year period to 2033/34 mainly due to the suspension of Conawapa. OM&A expenses are reduced by $0.4 billion mainly due to the reclassification of Great Northern Transmission line costs.

3.4.1 Consolidated Financial Targets

Manitoba Hydro has three primary financial targets for consolidated operations which are used to assess the financial strength of the Corporation.

1. Debt/Equity: Maintain a minimum debt/equity ratio of 75:25.
2. Interest Coverage: Maintain a minimum annual gross interest coverage ratio of greater than 1.20.
3. Capital Coverage: Maintain a capital coverage ratio of greater than 1.20 (excepting new major generation and transmission).

The Corporation has commenced construction on the Bipole III Reliability and Keeyask generating station projects. It is recognized that it may not be possible to maintain financial targets during this period of major investment in the generation and transmission system and that financial ratios will deteriorate during this investment period, even with the proposed and indicative rate increases of 3.95%.

Manitoba Hydro recognizes that the rate increases that would be necessary to maintain its financial ratios at or above targets in the near to medium term, would be financially challenging for its customers. Further, this would be inconsistent with Manitoba Hydro's approach of smoothing rate increases over time in order to promote rate stability. Consequently in MH14, financial results and ratios are projected to be significantly below target for an extended period of time. Notwithstanding Manitoba Hydro's desire to smooth rate increases to customers over time, the Corporation recognizes that the 3.95% rate increases are the minimum that are required to maintain rate stability and financial integrity.

The PUB expressed concern with respect to the adequacy of Manitoba Hydro's financial reserves when it found in Order 43/13, page 23:

> *"Manitoba Hydro currently has achieved its debt-to-equity target of 75:25. However, the Board is concerned about the contemplated deterioration in the utility's financial targets, particularly the fact that by 2021, the debt-to-equity ratio is projected to be*

> *90:10. Any further escalations in the capital cost for Manitoba Hydro's major new capital projects will cause the financial structure to deteriorate further.*
>
> …
>
> *The Board is concerned that, by moving towards a 90:10 debt-to-equity ratio by the end of the decade, there will be an insufficient retained earnings reserve to deal with droughts and other risks such as infrastructure failure or rising interest rates. The Board sees a need to further examine and quantify the other risks that Manitoba Hydro faces at the next General Rate Application and determine whether these should be subject to separate reserve provisions. The Board will require Manitoba Hydro to provide an analysis of risks on a quantitative and probabilistic basis at the next General Rate Application.*
>
> *The Board notes that Manitoba Hydro shares the benefit of the flow-through credit rating of the Province, which affords it preferential interest rates on its debt and access to funds to meet its major capital spending program. However, as its debt grows, there is a potential for Manitoba Hydro's financial condition to affect the credit rating of the Province. It is important that Manitoba Hydro remains a financially strong and viable organization."*

Manitoba Hydro has recently commenced a review of its financial targets and KPMG has been selected as the consultant to provide recommendations to Manitoba Hydro on the appropriate financial targets which align with the mandate of the Corporation and the interests of its stakeholders considering its operating and business outlook and associated risks. The review will consider the objectives of maintaining rate stability for customers and Manitoba Hydro's self-supporting status for credit rating proposes. It is expected that this review will be completed in time for the approval of IFF15 by the MHEB in late fall of 2015.

As part of this review, analysis will also be provided to satisfy PUB Directive 10 from Order 43/13 to review Manitoba Hydro's operating and financial risks in order to assess the adequacy of financial reserves, including, as appropriate, the use of quantitative and probabilistic analysis. It is expected that this information would be available for review by the PUB at the next GRA proceeding.

Manitoba Hydro has filed extensive information in Appendices 3.5 and 3.6 of the Application with respect to the financial impacts of the key risks of the Corporation, as well as the financial implications of various alternative rate scenarios. Manitoba Hydro is of the view that this information provides adequate support for the PUB to approve Manitoba Hydro's Application for 2015/16 and 2016/17.

The 3.95% proposed and indicative rate increases are the minimum necessary to manage the significant deterioration in Manitoba Hydro's projected financial results and ratios in the next 10 year period. Should the PUB defer the proposed rate increases, there is greater risk that future rate increases will be significantly higher than 3.95%.

3.4.2 Equity Ratio

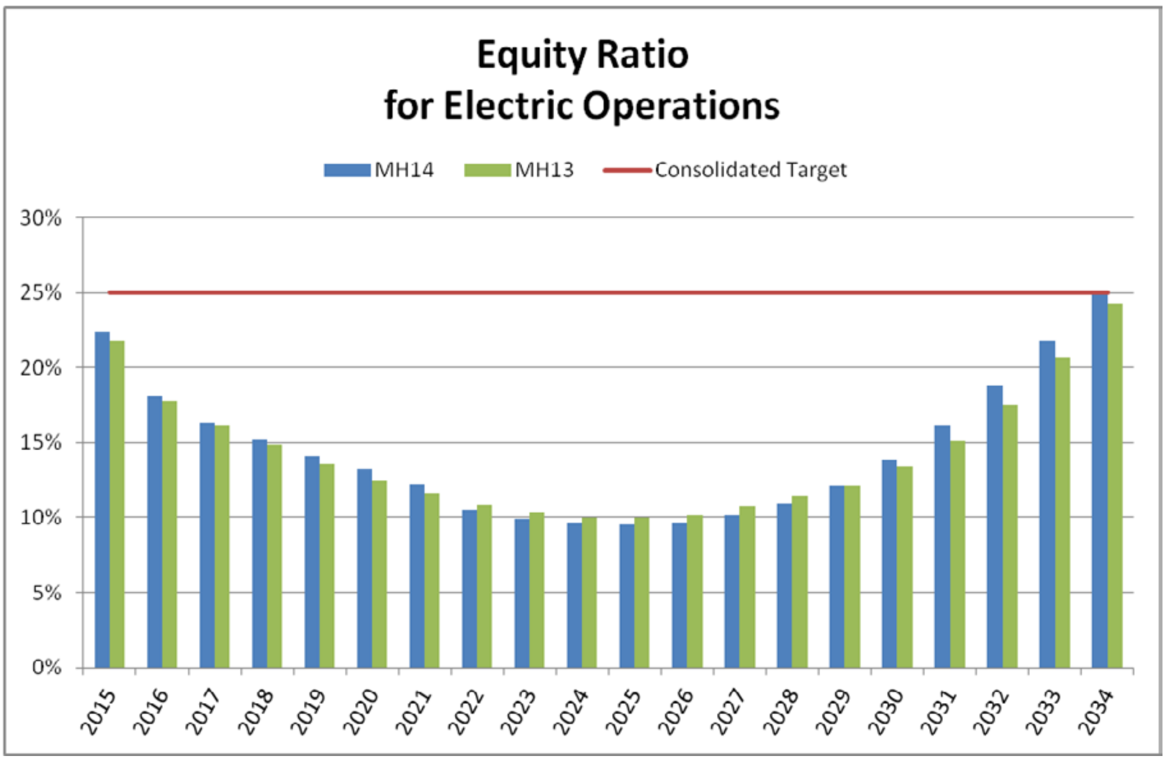
Manitoba Hydro's consolidated debt/equity target is to maintain a minimum debt to equity ratio of 75:25 (i.e. 75% debt and 25% equity). The equity ratio measures the portion of assets that have been financed by internally generated funds (equity) rather than debt. Manitoba Hydro's equity is not a cash reserve but is primarily represented by the internally generated funds accumulated since its inception that have been reinvested in the assets of the Corporation.

It is beneficial for customers when assets are funded through internally generated funds rather than debt in that Manitoba Hydro must collect the carrying costs on debt through rates. The ability to fund a portion of assets through internally generated funds is also beneficial in that it preserves borrowing capacity in the event of any adverse financial impact. It is very important that Manitoba Hydro achieve an appropriate balance of debt and equity such that the Corporation can continue to invest in its system without driving its debt to unacceptable levels or dramatically impacting customers' rates.

Should the capital markets perceive Manitoba Hydro's debt levels to be too high, there may be negative implications to the Province's credit ratings, which could result in higher borrowing costs. An appropriate debt/equity target, assists Manitoba Hydro to maintain reasonable levels of debt and equity in proportion to the assets the Corporation has invested in, in order to keep debt and borrowing costs at manageable levels. As a result of the significance of the size of Manitoba Hydro's debt in relation to the Province of Manitoba's debt as a whole, the debt/equity ratio is a key indicator in the review of Manitoba Hydro for the Province's credit rating.

Figure 3.4 below provides the projected electric operations equity ratio for MH14 compared to MH13. Manitoba Hydro's electric operations equity ratio was 23% at March 31, 2014. The debt/equity ratio is projected to weaken substantially over the next several years to 10% by 2022/23 (the same level as MH13) mainly due to the significant capital investment in major new generation and transmission and expenditures to renew and replace aging infrastructure. The equity ratio is projected to return to the 25% target by 2033/34 (the same year as in MH13) due to the regular and reasonable rate increases that are included in the forecast, as well as export revenues resulting from the Keeyask Generating Station.

Figure 3.4 Projected Equity Ratio



In Manitoba Hydro's judgment, the projected deterioration in the equity ratio in MH14 is at the minimum acceptable financial operating level even with the proposed and indicative rate increases. Any further deterioration in the equity ratio significantly increases the risk of large rate increases to customers in the longer term and any reduction to the rate increases proposed in this Application only intensifies this risk to customers. As an example, the impact of the reoccurrence of the historic 5-year drought would result in significant further deterioration in the equity ratio from MH14 and essentially deplete Manitoba Hydro's financial reserves. In this circumstance, there would not be sufficient reserves to mitigate the potential financial impacts of the considerable array of the risks the Corporation faces in fulfilling its mandate.

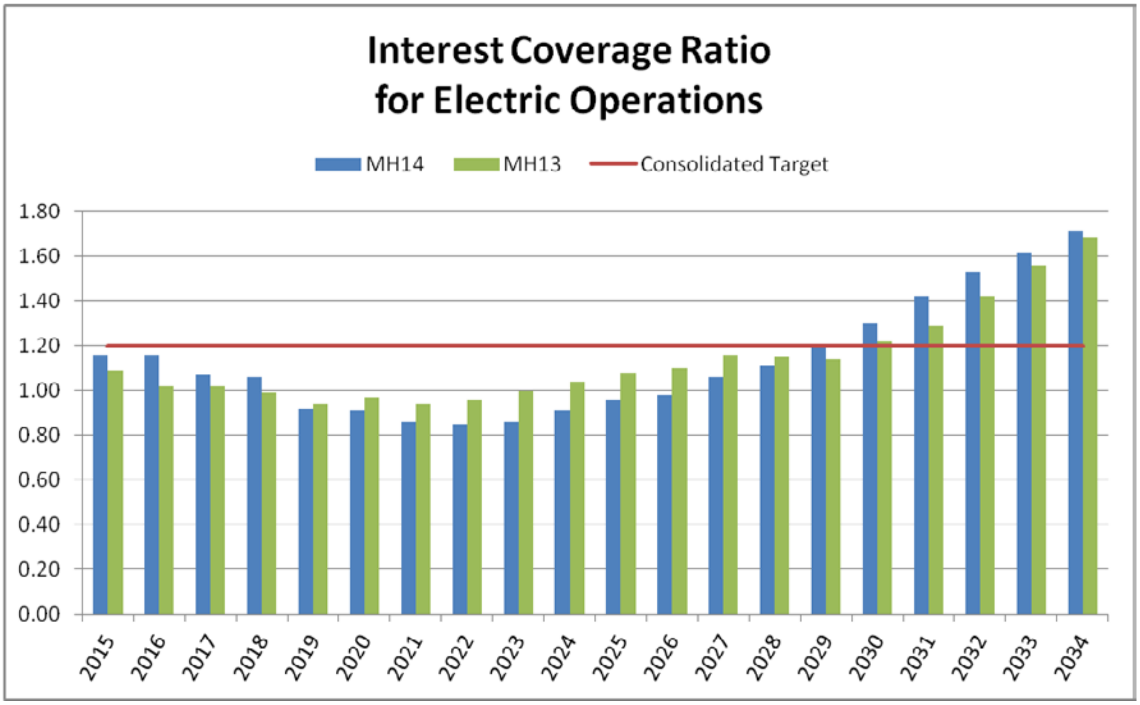
3.4.3 Interest Coverage Ratio

Manitoba Hydro's consolidated target is to maintain a minimum annual gross interest coverage ratio of greater than 1.20. The interest coverage ratio provides an indication of the ability of the Corporation to meet interest payment obligations with the net income generated by the Corporation. Annual interest coverage at or greater than 1.20 ensures that there is a sufficient margin of earnings in excess of that which is required to cover interest payments to bondholders.

Manitoba Hydro's interest coverage ratio is also forecast to be well below target for several years of the forecast. In eight years of the forecast, Manitoba Hydro's interest coverage ratio is below 1.0, which indicates that the utility would experience elevated operational liquidity risk and may have difficulty generating sufficient revenues and cash flow from operations to pay its interest obligations.

Figure 3.5 below provides the projected electric operations interest coverage ratio for MH14 compared to MH13. Manitoba Hydro's electric operations interest coverage ratio was 1.25 at March 31, 2014. Lower net earnings and higher finance expenses associated with the higher capital costs of Bipole III, DSM, Keeyask and aging infrastructure renewal and replacement results in projected interest coverage ratios lower than target for a period of fourteen years, and below 1.00 for eight of those years, before returning to target in 2028/29.

Figure 3.5 Projected Interest Coverage Ratio



4.4.4 Capital Coverage Ratio

Manitoba Hydro's consolidated target is to maintain a capital coverage ratio of greater than 1.20. The capital coverage ratio measures the ability of current period internally generated funds to finance sustaining capital expenditures (excluding major new generation and transmission capital expenditures). A capital coverage ratio of greater than 1.20 provides sufficient cash flow from operations to fund sustaining capital expenditures and further reduces the need for debt financing.

Similar to the interest coverage ratio, a lower capital coverage ratio indicates that the utility has less revenues or more operating or finance expenses resulting in less cash flow from operations to fund sustaining capital expenditures. A capital coverage ratio of less than 1.0 indicates that the utility is having difficulty generating sufficient revenues required to fund its sustaining capital expenditures and must borrow more debt in order maintain the same level of expenditures and customer service. The capital coverage ratio is a measure that assists in keeping Manitoba Hydro's debt and finance expense at manageable levels.

Figure 3.6 below provides the projected electric operations capital coverage ratio for MH14 compared to MH13. Manitoba Hydro's electric operations capital coverage ratio was 1.39 at March 31, 2014. Capital coverage is projected to be below target for nine years of the forecast, and below 1.00 for six of those nine years, due to the reduction in net income and increasing capital requirements to replace aging infrastructure. The capital coverage ratio is projected to return to target by 2023/24 and then projected cash flows are sufficient to enable this target to be met in the remaining years of the forecast.

Figure 3.6 Projected Capital Coverage Ratio

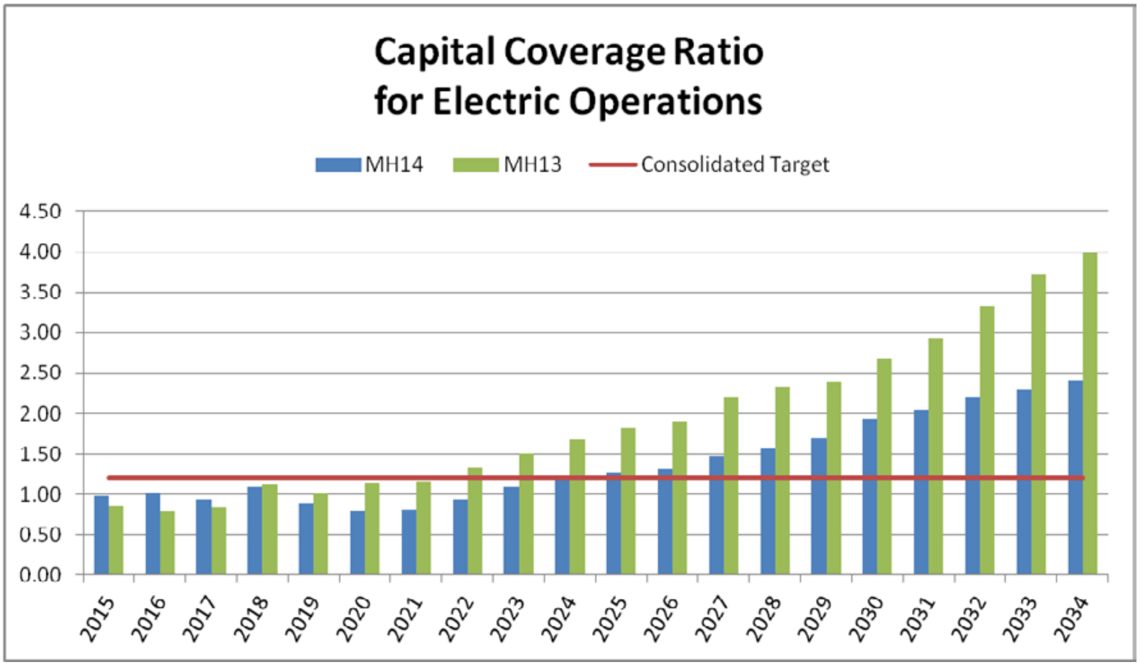


Figure 3.7 below shows the relationship between sustaining capital expenditures and cash flow from operations for MH14. Although revenues (Manitoba and extraprovincial) are increasing gradually over MH14, cash flow from operations is relatively flat over the first four years and then declines for a short period to 2019/20.

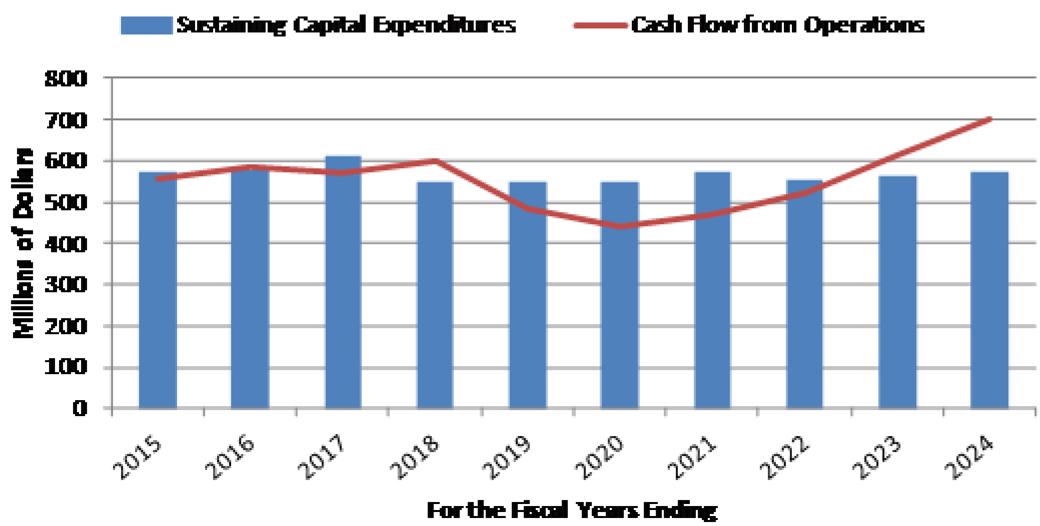
Until such time as there are sufficient internally generated funds in 2022/23, there is a cumulative sustaining capital expenditure funding deficit of $300 million which results in incremental borrowing for Manitoba Hydro. Following the in-service of the Keeyask Generating Station, revenues are projected to be sufficient to generate a surplus of cash flow from operations in excess of sustaining capital expenditures. In the interim, until the Keeyask Generating Station is generating revenue, any further reduction in revenues or increases in capital expenditures will result in further capital coverage ratio deterioration which increases the risk of significant rate increases to customers in the future.

Figure 3.7 Sustaining Capital Expenditures and Cash Flow from Operations



3.5 DEBT MANAGEMENT STRATEGY

The Debt Management Strategy document (see Appendix 3.7) provides information on the historical growth of the Corporation's investment in fixed assets and the corresponding increase in Manitoba Hydro's long term debt. The document also summarizes the statutes that govern the Corporation's financing programs, and outlines the debt management strategies that will address the Corporation's financing requirements for the 2014/15, 2015/16 and 2016/17 fiscal years.

Manitoba Hydro's fundamental debt management objective is to provide stable, low cost funding to meet the financial obligations and liquidity needs of the Corporation.

The low interest rate environment over the past few years has provided the opportunity for Manitoba Hydro to secure stable, low cost funding. Since 2006/07, the debt portfolio's net weighted average interest rate has decreased by nearly 2.0%. To enhance the debt portfolio stability, the weighted average term to maturity of the Corporation's debt portfolio has increased by over three years.

In order to mitigate refinancing risk, to maintain financing flexibility during the upcoming decade, and in keeping with the concept of matching the Corporation's long-lived assets with long term debt, Manitoba Hydro will continue to favour long term fixed rate financings with maturities of 10 years and longer.

3.6 CREDIT RATING AGENCY REPORTS

Manitoba Hydro uses debt advanced and guaranteed by the Province of Manitoba to finance its investment in assets. Manitoba Hydro's long and short term credit ratings are a flow-through of the Province of Manitoba's credit ratings (as highlighted in green in Figure 3.8 below):

Figure 3.8: Province of Manitoba Credit Ratings

S&P		Moody's		DBRS	
Long Term	Short Term	Long Term	Short Term	Long Term	Short Term
AAA	A-1+	Aaa	P-1	AAA	R-1 high
AA+		**Aa1**		AA high	
AA		Aa2		AA	**R-1 middle**
AA-		Aa3		AA low	
A+	A-1	A1		**A high**	R-1 low
A		A2		A	
A-	A-1/ A-2	A3	P-1/ P-2	A low	
BBB+	A-2	Baa1	P-2	BBB high	R-2 high
BBB	A-2/ A-3	Baa2	P-2/ P-3	BBB	R-2 middle
BBB-	A-3	Baa3	P-3	BBB low	R-2 low/ R-3

The Province of Manitoba has a high credit rating as can been seen in the following chart that shows the long term credit ratings for each of the Canadian provinces. This high credit rating benefits Manitoba Hydro's customers by reducing the cost of borrowing that the Corporation must recover in its rates.

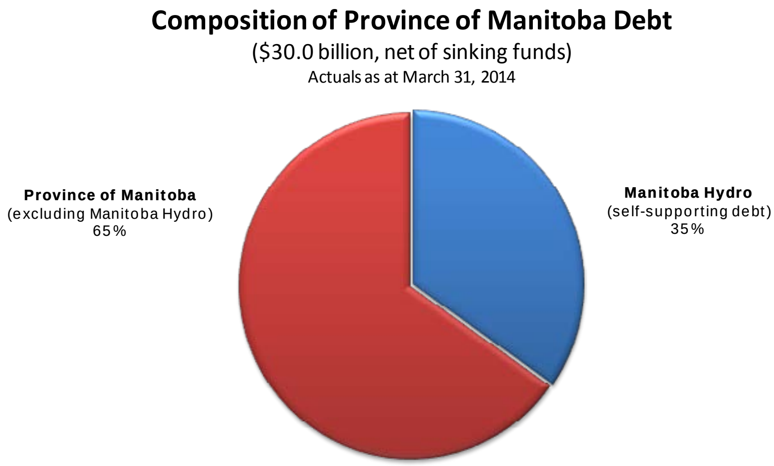
Figure 3.9: Provincial Long Term Credit Ratings Comparison

Province	Standard & Poors	DBRS	Moody's Investors Service
British Columbia	AAA	AA (high)	Aaa
Saskatchewan	AAA	AA	Aaa
Alberta	AAA	AAA	Aaa
Manitoba	AA	A (high)	Aa1
Ontario	AA-	AA (low)	Aa2
Nova Scotia	A+	A (high)	Aa2
Newfoundland & Labrador	A+	A	Aa2
Québec	A+	A (high)	Aa2
New Brunswick	A+	A (high)	Aa2
Prince Edward Island	A	A (low)	Aa2

Rating reports are issued to individual provinces and not necessarily at the same time.

As demonstrated in Figure 3.10, debt advances to Manitoba Hydro form a significant portion of the total provincial debt and the Corporation's financial performance is therefore a contributing factor toward the financial strength and stability of the Province's credit rating.

Figure 3.10 Composition of Province of Manitoba Debt



The credit rating agencies view Manitoba Hydro to be financially self-supporting in that the Corporation is able to meet its financial obligations based on its own revenues without being supported by the tax-base of the Province. As noted by Moody's Investors Service ("Moody's") in a credit analysis on the Province of Manitoba (September 5, 2012):

> "Roughly one third of the province's total direct and indirect debt is attributed to Manitoba Hydro (issued and on-lent by the province) and is considered to be self-supporting. This Crown Corporation's ability to meet its own financial obligations, without recourse to provincial subsidies is a positive credit attribute for the province."

Credit rating agencies view Manitoba Hydro's current low rates and reasonable regulatory framework as positive ratings considerations. According to Moody's (reports dated October 17, 2014 and November 6, 2014):

> "The province issues debt on behalf of its wholly-owned utility company Manitoba Hydro, which we view as a self-supporting entity and therefore,

> exclude the related net debt from the Province of Manitoba’s debt metrics. … The anticipated increase in debt at Manitoba Hydro could increase the contingent liability for the province of Manitoba in the next few years. … We will monitor the increase in Manitoba Hydro’s debt ratios and the progress of construction of these projects. … We note positively, that Manitoba Hydro has flexibility to increase utility rates given fairly low rates compared to other provinces and that it has already negotiated future long-term export contracts with customers in the US.”
>
> “Manitoba Hydro operates in a stable regulatory framework with steady yearly rate increases. It forecasts annual rate increases of 3.95% until FY2033 to contribute to replacing aging generation, transmission and distribution facilities. The rates are set on a cost-of-service basis. The MPUB independently overseas the rate setting process and has a supportive environment for cost recovery. Residents of Manitoba continue to pay rates that are among the lowest in North America. Revenues from exports to the US and other Canadian provinces accounts for over 20% of electric revenue, alleviating pressure of rate hikes and contributing to the current low rates in the Province.”

Attached for information as Appendix 3.8, are the following credit reports that have recently been issued by DBRS and Moody’s for Manitoba Hydro and the Province of Manitoba:

- DBRS Province of Manitoba October 17, 2014
- DBRS Manitoba Hydro October 23, 2014
- Moody’s Province of Manitoba October 17, 2014
- Moody’s Manitoba Hydro November 6, 2014

Manitoba Hydro is awaiting permission from Standard & Poor’s to provide copies of the most current credit rating reports.

While Moody’s reaffirmed the Province of Manitoba’s credit ratings, they revised the outlook on the Province of Manitoba's Aa1 long term debt ratings from stable to negative. Moody's P-1 short term rating on the Manitoba Hydro-Electric Board's commercial paper program was not affected. Credit ratings and outlooks from S&P and DBRS remained unchanged.

It is important that credit rating agencies continue to view Manitoba Hydro's debt as self-supporting and that weakened financial ratios as a result of major capital investments and reinvestments do not negatively impact the credit rating of the Province.

The proposed rate increases are necessary to continue to demonstrate to the credit rating agencies that the regulatory framework in Manitoba is supportive of Manitoba Hydro's self-supporting financial status.

ECONOMIC OUTLOOK

2014-2035

ECONOMIC ANALYSIS DEPARTMENT

SPRING, 2014

EO14-1

CONTENTS

PREFACE

This information in the Economic Outlook is used in several areas of the corporation; for example, in load forecasting, project evaluation, and financial planning.

The document is derived from the following sources: IHS Global Insight, the Conference Board of Canada, Spatial Economics, BMO Nesbitt Burns, CIBC, Desjardins, Laurentian, Royal Bank of Canada, Scotiabank, National Bank, and TD Bank. As a final step prior to publication, the forecast is refined to reflect information available in early spring.

This forecast is based on what was known and could reasonably be foreseen at the time of its preparation. Users should be cognizant that conditions can and do change and should apply sensitivity analysis accordingly.

The variables are presented in both calendar year and fiscal year format. Fiscal year data have been derived from calendar year data. Fiscal year data are presented in Appendix A; the balance of the text relates to calendar year information.

FORECASTS OF KEY ECONOMIC AND FINANCIAL INDICATORS

The forecasts reported in the Economic Outlook are based on a consensus view of several independent sources including Canada's primary financial institutions in addition to several other independent sources, all of which are well known and respected. For the purpose of the 2014 Economic Outlook, the forecasting sources included IHS Global Insight, the Conference Board of Canada, Spatial Economics, BMO Nesbitt Burns, CIBC, Desjardins, Laurentian, Royal Bank of Canada, Scotiabank, National Bank of Canada, and TD Bank.

The following sections of the report provide tables, graphs, and written summaries of the data behind the forecasts for the following key economic indicators:

- Real Gross Domestic Product Growth Rate,
- Pricing – CPI and GDP Implicit Price Deflator,
- Population,
- Employment,
- Housing,
- Short-term and Long-term Interest Rates,
- C$/US$ Exchange Rate, and
- Manitoba Disposable Income.

Appendix A and B of this report provide the history and forecasts for key economic indicators for Manitoba and Canada on a fiscal year basis and a calendar year basis, respectively.

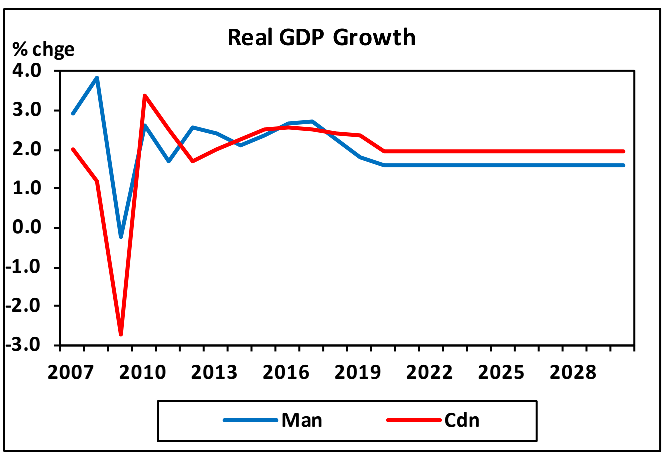
REAL GROSS DOMESTIC PRODUCT

RECENT PERFORMANCE:

Over the past five years (2008-2013) Manitoba has had the third best average annual real GDP growth of the Canadian provinces at 1.8%. In 2013, Manitoba's real GDP increased by 2.4% down from the 2.6% growth it experienced in 2012. Canada's economy grew at a modest 2.0% while the US economy real GDP growth shrank to 1.9% in 2013.

OUTLOOK:

The consensus survey suggests that Government policies are expected to remain tight in the near term causing a fiscal drag on the Manitoba and Canadian economy. EO2014 forecasts that economic growth in Manitoba is expected to continue to slow in 2014, with the economy expanding by 2.1%. The strengthening growth south of the border, however, should boost Manitoba's economy as roughly 70% of the province's exports are to the United States. This should help Manitoba's economy advance to 2.7% by 2016. The drop in long-term growth at 1.6% is based on the assumption that the rest of the world growth will slow down after the medium term recovery.



PRICING: CONSUMER PRICE INDEX AND GDP PRICE DEFLATOR

RECENT PERFORMANCE:

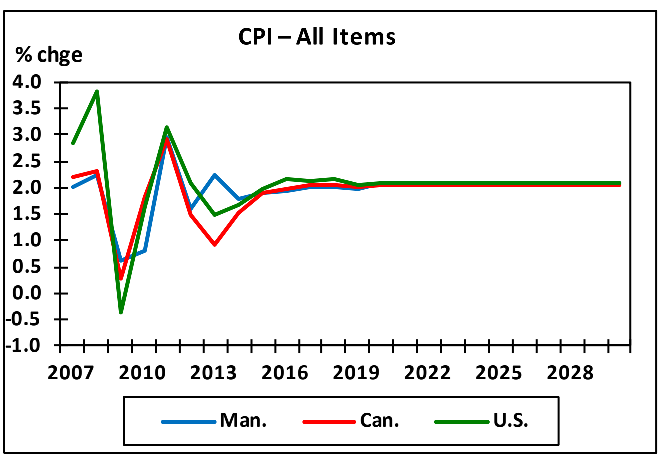
The Consumer Price Index (CPI) is based on a basket of household goods while the GDP price deflator is based on all goods produced domestically. Although inflation is now recovering, within the last year it accelerated faster than anticipated. In Manitoba, tobacco and alcohol, energy, shelter, food, transportation, and household operations boosted overall consumer prices while health and personal care, clothing and footwear, and recreation put downward pressure on prices. In Canada, tobacco and alcohol and energy boosted overall consumer prices while health and personal care, clothing and footwear and recreation put downward pressure on prices. In 2013, Manitoba and Canada CPI increased by 2.2% and 0.9%, respectively, while the U.S. CPI increased by 1.5%. Manitoba and Canadian GDP price deflators increased by 1.3% and 1.2%, respectively, while the U.S. GDP price deflator increased by 1.5% in 2013.

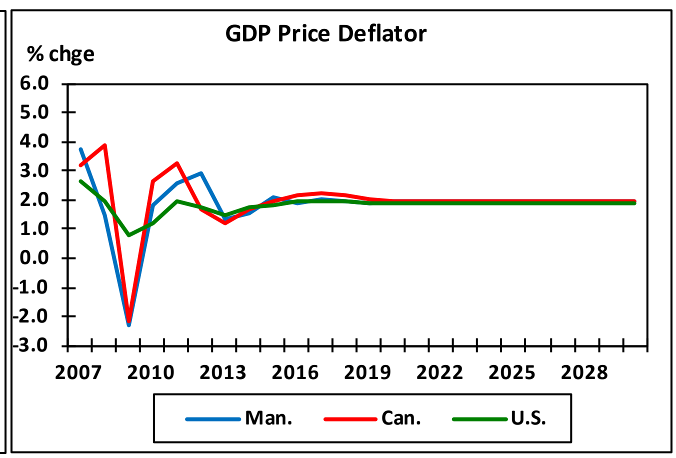
2013 Consumer Price Index
% chge

	Manitoba	Canada
All Items – CPI	2.2	0.9
Food	2.5	1.2
Shelter	3.1	1.3
Household	2.3	1.2
Clothing	1.0	0.1
Transportation	2.2	0.7
Health	-1.6	-0.3
Recreation	0.3	0.3
Other Deflators:		
Energy	3.0	1.5
GDP Deflator	1.3	1.2

OUTLOOK:

The depreciating Canadian dollar is expected to put upward pressure on producer's prices. This, coupled with increasing Manitoba wage rate growth is expected to push Manitoba CPI inflation averaging 2.1% throughout the long-term forecast period. The 2014 Economic Outlook forecasts that Canada and U.S. long-term CPI will be 2.0% and 2.1%, respectively. The 2014 Economic Outlook forecasts that in the long term the Manitoba GDP price deflator will be 1.9%, while Canada and the U.S. GDP price deflator will be 2.0% and 1.9% respectively.





POPULATION

RECENT PERFORMANCE:

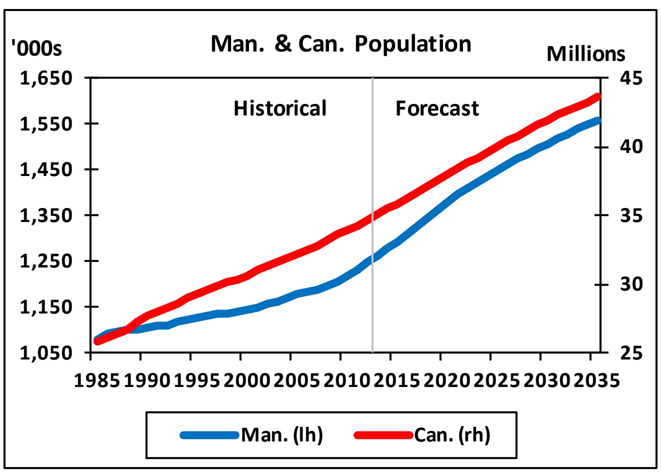
Year	Mb Pop'n. Changes
1995	5,920
1996	5,046
1997	1,932
1998	1,361
1999	4,959
2000	4,865
2001	4,137
2002	5,186
2003	6,892
2004	9,695
2005	5,074
2006	5,228
2007	5,842
2008	8,406
2009	10,815
2010	12,341
2011	12,798
2012	16,304
2013	14,983

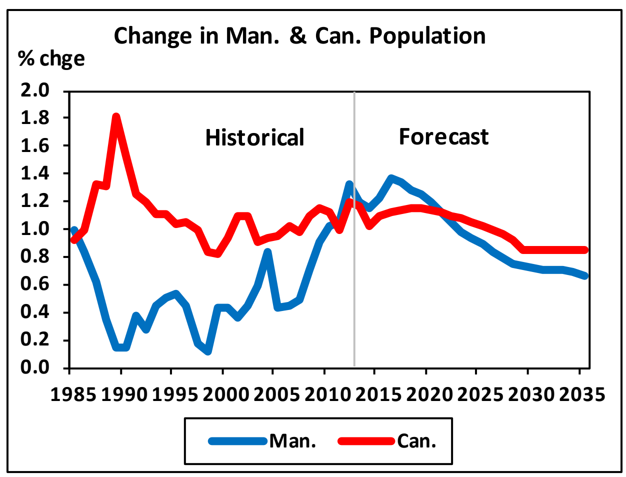
Manitoba's total population increased by 14,983 persons in 2013 or 1.2% relative to 2012. Total net migration to Manitoba was 9,522 people and total natural increase was 5,461 in 2013.

OUTLOOK:

Manitoba's population is expected to grow on average at 0.9% or 13,400 people annually over the forecast period, 1,500 people lower than the growth rate forecast in EO2013. The drop in this year's forecast is due to the international immigration front, with the announcement of the government putting a cap on the number of new applications at 5,000 annually for the Provincial Nominee Program. Despite the above announcement, this year's forecast has two main assumptions: one being the Provincial Nominee Program which will continue to sustain moderate annual growth in immigrants, and two, an "optimal immigration approach" whereby government adjusts future immigration requirements to meet labour market needs. According to Spatial Economics, "the optimal level of immigration is one that facilitates economic growth and minimizes the costs of excess demand for and supply of workers."

Canada's population is expected to grow on average at 1.0% or 386,000 annually over the forecast period. The United States population is expected to grow on average at 0.7% or 2,400,000 people annually.





EMPLOYMENT

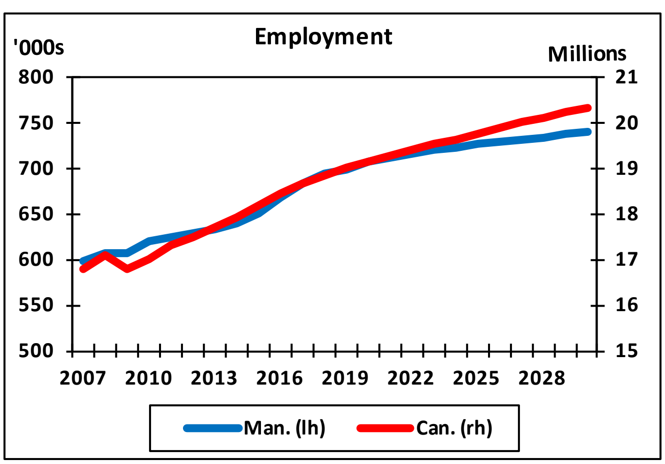
RECENT PERFORMANCE:

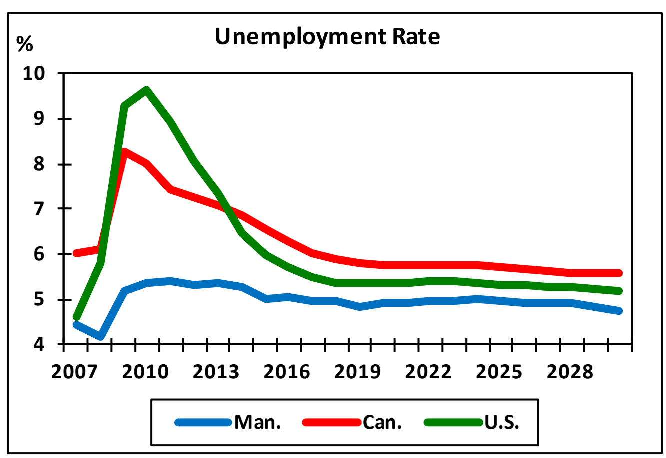
Manitoba's total employment expanded by 3,100 persons in 2013 or 0.5% relative to 2012. The primary goods producing sectors have rebounded this past year with agriculture posting gains of 3,100 persons, construction at 1,200 persons, and the forestry, utilities, and the manufacturing sectors gaining each 400 persons of employment. The services producing sector struggled this past year as employment dropped by 2,200 in the trade sector, and the finance, insurance, real estate, and public administration sectors each dropping by 1,400 persons of employment. In 2013 Manitoba's unemployment rate increased from 5.3% to 5.4% but remains the third lowest of the Canadian provinces after Alberta and Saskatchewan and below the 7.1% national average.

	Manitoba			Canada			United States		
	2003	**2013**	**% chge 13/12**	**2003**	**2013**	**% chge 13/12**	**2003**	**2013**	**% chge 13/12**
Population 15+ – '000s	875	974	1.1	25,099	28,673	1.3	221,168	245,679	1.0
Participation Rate - %	68.7	68.7		67.5	66.5		66.2	63.2	
Labour Force – '000s	601	669	0.5	16,948	19,079	1.1	146,500	155,389	0.3
Employment – '000s	571	633	0.5	15,663	17,731	1.3	137,729	143,929	1.0
Unemployment Rate – %	5.0	5.4		7.6	7.1		6.0	7.4	
Employment Rate – %	65.2	65.0		62.4	61.8		62.3	58.6	

OUTLOOK:

Manitoba's employment is forecast to grow by 1.2% in 2014 – up from 0.5% in 2013. Employment growth is expected to increase over most of the medium term to average 2.0% per year over the period. This is in line with overall economic growth averaging 2.5% annually and productivity gains averaging 1.0% per year over the medium outlook. Over the 2014-2035 period, Manitoba's and Canada's employment levels are forecast to grow annually at 0.8% and 0.7% respectively, while the United States' is anticipated to grow at 1% annually. Manitoba's unemployment rate is expected to trend downwards from 5.3% in 2014 to 5.0% in 2019 and remain around 4.9% until 2035. Canada's unemployment rate is expected to trend from 6.9% in 2014 to 5.7% in 2035. The United States' unemployment rate is expected to trend from 6.5% in 2014 to 5.1% in 2035.





HOUSING

RECENT PERFORMANCE:

Total Manitoba's housing starts were 7,465 in 2013, up from 7,242 units in 2012. Population growth, increase in employment numbers, rising wages, and low mortgage rates were the driving force behind the demand for housing in 2013. With respect to Manitoba Hydro metered residential customers, there was an increase of 6,387 units in 2013 relative to 2012.

OUTLOOK:

Due to reduced in-migration in the short term, EO2014 forecasts that Manitoba housing starts are expected to remain stable over the next two years before it picks up in 2016. In the medium to long run, housing starts are expected to fall as population growth stabilizes due to reduced migration. EO2014 forecasts that Manitoba housing starts will increase at approximately 6,940 units annually in the longer term. The forecasted annual population growth rate in Manitoba of 13,400 people in EO2014 is 1,500 people lower than the growth rate forecast in EO2013 and is the main driver in the increased housing starts.

EO2014 forecasts that Manitoba residential customers will increase by 4,920 units or 0.9% annually over the 2014-2035 period, down about 430 units annually from EO2013. Refer to Appendices A and B for the forecasts of Manitoba residential customers expressed in calendar and fiscal years.

	Man. Housing Starts	Man. Res. Cust. '000s	Can. Housing Starts '000s
1995	1,963	398	111
1996	2,318	400	125

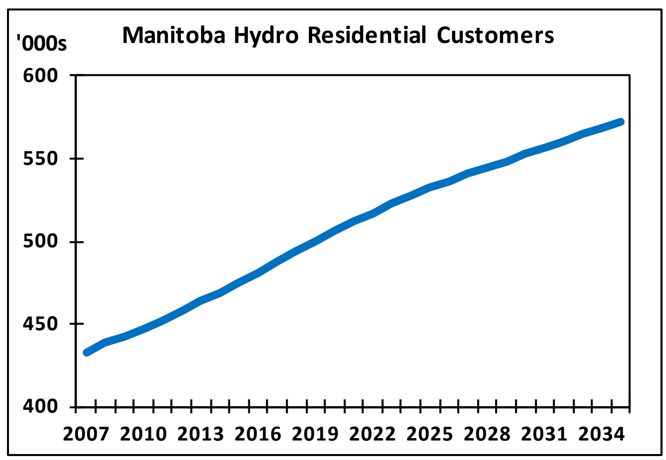
2012	7,242	458	215
2013	7,465	464	188



INTEREST RATES

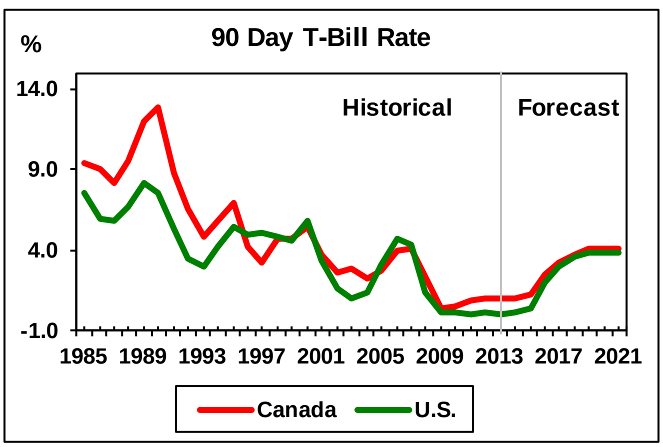
RECENT PERFORMANCE:

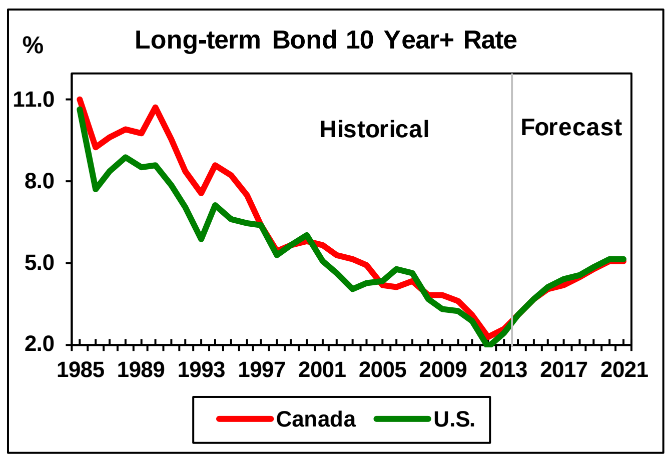
For the purposes of representing the long-term interest rates that impact Manitoba Hydro, for Canadian long-term debt the average of a 10 year and a 30 year Canadian long bond rate is used and is referred to as a 10 Yr+ rate. For U.S. long-term debt, a 10 year U.S. long bond rate is used.

In 2013, the Bank of Canada kept the overnight policy rate unchanged at 1.00% throughout 2013. The 90 Day T-bill rate remained unchanged at 0.96% in 2013 similar to 0.96% in 2012, while the 10 Yr+ bond rate increased from 2.25% in 2012 to 2.58% over the same period.

OUTLOOK:

The consensus survey expects the Bank of Canada's next move is to start to increase interest rates in the short term. The Federal Reserve is expected to move with the Bank of Canada, narrowing the gap between Canada/U.S. interest rate spreads and is expected to decline over the forecast period. Economic Outlook 2014 forecast short and long-term rates will gradually rise over the last half of the forecast period, reflecting the Bank of Canada's concern on inflation impact. Economic Outlook 2014 forecasts Canadian 90 Day T-Bill rates are expected to trend from 0.95% in 2014 to 4.05% in the long term. Canada and U.S. long bond rates are forecast to trend up to 5.00% and 5.10%, respectively.





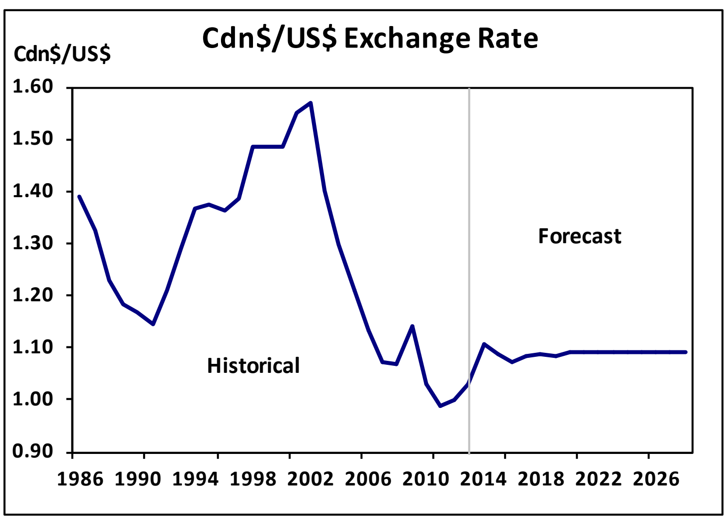
EXCHANGE RATE

RECENT PERFORMANCE:

In 2013 the Canadian dollar depreciated relative to the U.S. dollar by 3.1% relative to 2012. The recent decline of the Canada-U.S. dollar has been associated with softening commodity prices and the worsening current account balance. Renewed confidence in the U.S. currency and an underperforming Canadian economy relative to the U.S. are also responsible for the loonie's depreciation.

OUTLOOK:

Economic Outlook 2014 forecasts that the Canadian dollar is expected to remain low for the rest of the year and into the near term with a slight appreciation of a few cents. As the Bank of Canada will likely increase interest rates in 2015 this will pressure the Canadian dollar to increase, however, this change won't be very significant as the survey suggests the Federal Reserve to also move rates at similar times. Accordingly, narrowing Canada/U.S. interest rates will keep the dollar low and well below parity.



Year	US$/ Cdn.$	Cdn.$/ US$

MANITOBA DISPOSABLE INCOME

RECENT PERFORMANCE:

Slowdowns in wage growth were largely attributed to austerity measures within the government and associated programs.

OUTLOOK:

Manitoba's labour market is expected to tighten in the medium term, due to anticipated expansions in the construction and mining industry, putting upward pressure on wage rates. This robust growth in the goods-producing sector will help lift employment and household disposable income over the next two years and on.

APPENDIX 3.2: ADDITIONAL INFORMATION FOR INTEREST RATE FORECAST

Table 1 on the following page depicts the sources used to derive the forecast of Canadian 3 month T-bill rates for each quarter of the 2014/15 – 2020/21 period (with end of period rates adjusted to a comparable average period basis), as utilized in IFF14.

Table 2 depicts the sources used to derive the forecast of Canadian bond yield 10 yr+ rates for the 2014/15 – 2020/21 period (with end of period rates adjusted to a comparable average period basis), as utilized in IFF14.

Copies of the publically available source forecasts utilized in IFF14 are provided at the end of this response.

For forecasters that provided end of period rates, the rates provided in Tables 1 and 2 reflect rates adjusted to a comparable average period basis. For example, Desjardin's forecast provided end of period rates. Their forecast for 2015 Q2 end of period is 1.00% and 2015 Q3 end of period is 1.20% for Canada 3-month T-Bill. In order to place the forecast on an equivalent basis for a 2015 Q3 average period forecast, Desjardin's 2015 Q3 end of period forecast of 1.20% was averaged with their 2015 Q2 end of period forecast of 1.00% to approximate an average period 2015 Q3 forecast of 1.10%. This process was followed for all subsequent quarters and for all forecasters that provided end of period rates.

Note: The rates provided for Q2 and Q3 reflect actual average period Canadian 10 Year+ Bond Yield rates.

Note: In the case where source forecasts are provided as end-of-period, the 2014 Q3 end-of-period actual rate of 2.43% (average of 2.19% for Canada 10 year and 2.67% for Canada 30 year) was averaged with the source forecasters' end-of-period rate for Q4 in order to approximate an average period 2014 Q4 forecast rate.

Note: The extended forecast provided by BMO Nesbitt Burns for 2016+ is proprietary and cannot be disclosed.

The calculations of the Canadian 3-Month T-Bill and Canada Bond Yield 10 year+ rates for the 2014/15, 2015/16 and 2016/17 period are as follows:

- The 2014/15 forecast included the average of all data points within Q2, Q3, Q4 of 2014 and Q1 of 2015. The 2015/16 forecast included the average of all data points within Q2, Q3, Q4 of 2015 and Q1 of 2016. The 2016/17 forecast included the average of all data points within Q2, Q3, Q4 of 2016 and Q1 of 2017. For example, the Canada 3-Month T-Bill rate for 2015/16 of 1.30% (rounded to the nearest 5 basis points) in Table 1 was calculated as the average of the following data points:

	2015 Q2	**2015 Q3**	**2015 Q4**	**2016 Q1**
BMO Nesbitt Burns	0.93%	0.93%	1.19%	*
CIBC	1.03%	1.13%	1.33%	1.45%
Desjardins	1.00%	1.10%	1.35%	
Laurantian	1.00%	1.00%	1.25%	
National Bank	1.25%	1.69%	1.93%	
Royal Bank	1.23%	1.48%	1.73%	
Scotiabank	1.03%	1.13%	1.38%	
TD Bank	1.00%	1.23%	1.40%	1.48%
IHS Global Insight	1.00%	1.08%	1.40%	2.17%
Conference Board	1.00%	1.13%	1.21%	1.25%
Average	**1.30%**			

**Information provided by BMO is proprietary and cannot be disclosed.*

The Manitoba Hydro Canadian short-term interest rate was calculated by adding the guarantee fee of 1.00% to the 3-Month T-Bill rate as follows:

	Canada 3-Month T-Bill	Guarantee Fee	MH Cdn Short Term Rate
2014/15	0.95%	1.00%	1.95%
2015/16	1.30%	1.00%	2.30%
2016/17	2.40%	1.00%	3.40%

The Manitoba Hydro Canadian long-term interest rate was calculated by adding the appropriate credit spread to the Canada Bond Yield 10 Year+ rate and a provincial debt guarantee fee as follows:

	Canada Bond Yield 10 Yr+	Spread	Guarantee Fee	MH Cdn Long Term Rate
2014/15	2.60%	0.90%	1.00%	4.50%
2015/16	3.30%	0.80%	1.00%	5.10%
2016/17	3.75%	0.75%	1.00%	5.50%

KEY FINANCIAL RESULTS
(Dollars are in millions)

	Actual	IFF14 Forecast			
	2013/14	2014/15	2015/16	2016/17	2023/24
PROJECTED RATE INCREASES					
- ELECTRIC	3.50%[1]	2.75%[2]	3.95%[3]	3.95%[3]	3.95%
- GAS (non-commodity)	1.07%	-	-	-	1.75%
NET INCOME					
- ELECTRIC	$146	$ 102	$ 115	$ 59	($124)
- GAS	20	7	4	0	4
- SUBSIDIARIES	8	6	6	7	11
CAPITAL EXPENDITURES					
- ELECTRIC	$ 1 348	$ 2 023	$ 2 491	$ 3 073	$ 681
- GAS	35	48	65	51	43
DEBT/EQUITY RATIO	76:24	77:23	81:19	83:17	89:11
INTEREST COVERAGE RATIO	1.28	1.17	1.17	1.07	0.92
CAPITAL COVERAGE RATIO (excl. major new generation & transmission)	1.35	0.99	1.05	0.96	1.24
RETAINED EARNINGS	$2 716	$ 2 831	$ 2 901	$ 2 968	$2 226

[1] The 3.5% rate increase was implemented effective May 1, 2013. In accordance with PUB Order 43/13, 1.5% of the rate increase will be accrued to a deferral account to be utilized to mitigate the anticipated rate impact when Bipole III is placed in-service.
[2] The interim 2.75% rate increase was implemented effective May 1, 2014. In accordance with PUB Order 49/14, 0.75% of the rate increase will be accrued to a deferral account to be utilized to mitigate the anticipated rate impact when Bipole III is placed in-service.
[3] The proposed 3.95% rate increases would be effective April 1, 2015 and April 1, 2016.

EXECUTIVE SUMMARY

The Consolidated Integrated Financial Forecast (IFF14) projects Manitoba Hydro's financial results and financial position for the 20-year period from 2014/15 to 2033/34. Segmented forecasts are also provided for the electricity (MH14), natural gas (CGM14), and corporate subsidiaries (CS14).

The key changes to the financial outlook in IFF14 are as follows:

- Lower general consumers revenue ($3.3 billion) due mainly to increased demand side management savings, a lower approved rate increase for 2014/15 and lower projected indicative rate increases from 2031/32 to 2033/34.

- Lower projected net extraprovincial revenues ($2.0 billion) due mainly to the suspension of Conawapa, as well as lower projected export prices, partially offset by increased energy available for export as a result of increased demand side management (DSM) energy and capacity savings;

- Lower projected capital expenditure forecast ($7.5 billion) mainly due to the suspension of Conawapa ($10.1 billion) and the deferral of Pointe du Bois Powerhouse Rebuild ($1.5 billion). This decrease is partially offset by higher projected capital costs for sustaining capital ($1.9 billion), Bipole III ($1.3 billion), DSM ($0.9 billion), and Keeyask ($0.3 billion).

- Lower finance expense ($2.6 billion) and depreciation expense (down $0.2 billion) that result from lower projected interest rates, reductions in depreciation rates as recommended in the updated depreciation study, and the suspension of Conawapa. These decreases are partially offset by the higher projected capital costs for sustaining capital, Bipole III, DSM, and Keeyask.

In the near term to 2017/18, net income is higher compared to IFF13, largely due to favourable water flow conditions and lower finance and depreciation expenses. However, there are lower net earnings projected in the remaining years of IFF14 due to the key changes noted above. The projected net losses between 2018/19 to 2025/26 largely reflect the significant increase in carrying costs associated with Bipole III, sustaining capital expenditures and Keeyask which will essentially double the net plant of the Corporation. After that period, the higher export revenues associated with Keeyask and cumulative domestic rate increases return the Corporation to profitability.

For IFF14 forecast purposes, it is assumed that Conawapa has been suspended and replaced with a gas turbine required in 2037/38 to meet firm capacity requirements. While the majority of the planning and licensing activities on Conawapa have been suspended, Manitoba Hydro continues to pursue dependable firm export sales based on the earliest possible in-service date of Conawapa in 2029/30 and will re-evaluate the business case (currently anticipated by the Fall of 2016).

Manitoba Hydro continues to project minimum indicative rate increases of 3.95% per year in IFF14 to 2030/31 and then 2.00% thereafter to 2033/34. In order to maintain the 3.95% rate increases in the near to medium term, Manitoba Hydro continues to pursue further cost containment initiatives and the deferral or cancellation of a number of capital projects. Should a severe drought occur during the first 10-year period, net income and the equity ratio would be further challenged and higher rate increases would be necessary.

Consistent with IFF13, the equity ratio is projected to deteriorate from the current 24% level to 11% equity by 2022/23 before gradually beginning to recover to reach the 25% equity target by 2033/34. There is no change in attaining the 25% equity target compared to IFF13.

The other key financial targets – interest coverage and capital coverage – are also below target for several years but recover to the target range within the later years of the 20 year forecast.

The major factors contributing to the need for the 3.95% rate increases are the expenditures that are necessary to meet the growing electricity requirements of the Province and the requirement to replace distribution, transmission and substation assets that were installed up to 60 years ago. The aging infrastructure issue is facing all utilities in North America and is resulting in considerably higher rate increases than are being projected in Manitoba. For this reason, even with the rate increases being projected in IFF14, it is expected that Manitoba's domestic electricity customers will continue to have rates that are affordable and competitive with other utilities in North America.

The following is a summary of projected net income and key financial ratios over the 20-year period to 2033/34:

Years Ending March 31	Electric Rate Increases	Net Income	Retained Earnings	Debt / Equity	Interest Coverage	Capital Coverage
		(Millions)				
2015	-	$115	$2,831	77:23	1.17	0.99
2016	3.95%	126	2,901	81:19	1.17	1.05

Section 1

1.0 INTRODUCTION

The Consolidated Integrated Financial Forecast (IFF14) provides projections of Manitoba Hydro's financial results and financial position for the 20-year period from 2014/15 to 2033/34. Its purpose is to project the Corporation's long-term financial direction. The detailed forecasts in the first two years of the IFF are used for monthly reporting and variance analysis. The IFF serves as the primary forecast to determine the need for rate increases that are necessary for the Corporation to maintain a reasonable financial position and progress towards attaining and maintaining its financial targets.

The forecast is the culmination of an extensive integrated planning cycle at Manitoba Hydro. It is based on the best available information at the time it is prepared and includes forward looking information that incorporates expectations, estimates and assumptions concerning the future which are subject to change. Key inputs to the Integrated Financial Forecast include:

- Economic Outlook
- Energy Price Outlook
- Electricity Export Price Forecast
- Power Smart Plan
- Electric Load Forecast
- Natural Gas Volume Forecast
- Domestic Revenue Forecast
- Power Resource Plan
- Generation Costs and Interchange Revenue Forecast
- Capital Expenditure Forecast
- Operating, Maintenance & Administrative Expense Forecast

This forecast supersedes the 2013 Integrated Financial Forecast (IFF13) which was finalized in February of 2014.

2.0 RATES and ECONOMIC VARIABLES

2.1 Electricity Rates

In accordance with Manitoba Public Utilities Board (PUB) Order 49/14, IFF14 includes an interim 2.00% rate increase effective May 1, 2014 for revenues directed to General Consumers Revenue with a further 0.75% for revenues directed to the Bipole III Deferral Account. The Bipole III Deferral Account was established in PUB Order 43/13 to be utilized to mitigate the anticipated rate impact when Bipole III is placed in-service. IFF14 assumes that the revenues accumulated in the Bipole III Deferral Account will be drawn down over a 3-year period following the Bipole III in-service (July 2018) and that cumulative rate increases applied to the Bipole III Deferral Account will revert to general consumers revenue thereafter.

IFF14 proposes additional rate increases of 3.95% effective April 1 in each of 2015 and 2016. The April 1, 2015 rate increase will be requested on an interim basis to be finalized by the PUB in the 2015 General Rate Application. Indicative additional average annual electric rate increases of 3.95% are projected each April from 2017/18 through 2030/31 and then 2.00% from 2031/32 to 2033/34.

The rate increases proposed for 2015/16 and 2016/17 have been approved by the Manitoba Hydro-Electric Board (MHEB) for submission to the PUB. Proposed rate increases subsequent to 2017/18 may be changed in future forecasts and are presented for illustrative purposes only. Each year's revision to the Integrated Financial Forecast is based on the current year's assumptions including energy supply and demand, projected interest, escalation and exchange rates, projected prices for exported energy, operating and capital forecasts and other factors. Changes in any of these assumptions will have an impact on the projected future results. Actual rate applications made in future years will depend upon the circumstances and outlook at that time and will be subject to the review and approval of the MHEB.

2.2 Gas Rates

Manitoba Hydro does not propose any non-gas rate changes for 2014/15 through 2016/17. Thereafter, IFF14 assumes non-gas rate increases as required to generate Centra Gas net income of approximately $3 million each year. Gas general rate applications are also subject to review and approval by the MHEB prior to filing with the PUB.

2.3 Economic Variables

The economic assumptions used in the forecast are based upon Manitoba Hydro's Economic Outlook, with certain key variables updated as of October 2014 to reflect current economic conditions at that time. Projected rates for key economic indicators are listed below with the 2013 projected rates in brackets.

	Manitoba Consumer Price Index	MH CDN New Short Term Debt Rate *	MH CDN New Long Term Debt Rate *	US-CDN Exchange Rate (C$/US$)
2014/15	1.8% (2.0%)	0.95% (1.15%)	3.50% (4.05%)	1.10 (1.03)
2015/16	1.9% (2.0%)	1.30% (2.10%)	4.10% (4.35%)	1.12 (1.01)
2016/17	2.0% (2.0%)	2.40% (3.10%)	4.50% (4.60%)	1.12 (1.01)
2017/18	2.0% (2.0%)	3.10% (3.70%)	4.80% (5.40%)	1.12 (1.03)
2023/24	2.1% (2.0%)	3.90% (3.90%)	5.20% (5.75%)	1.10 (1.03)

* Excludes the 1% Provincial guarantee fee.

The forecasts of US-CDN exchange rates and interest rates have been decreased since the fall 2013 forecasts. The major factors influencing the drop in the forecast of US-CDN exchange rates is due to lower oil price projections and differing expectations with respect to Canadian and US monetary policy and growth. With the actual interest rates for the first three quarters of 2014 resulting in materially lower outcomes than what was forecasted and with the Bank of Canada's commitment to maintain short-term interest rates at near low levels, the updated lower starting point and gradual progression has resulted in lower interest rate forecasts. Forecasters now generally expect the Bank of Canada to hold off on raising interest rates to at least mid 2015 with the overall consensus being that the long-term rate will be lower than the pre-recession period.

3.0 MANITOBA ELECTRICITY LOAD FORECAST

General consumers revenue is forecast based on the future load requirements in Manitoba as projected in the 2014 Electric Load Forecast. The Load Forecast includes demand side management savings achieved to date as well as projected savings achieved through codes and standards. Planned additional savings are incorporated in the forecast of general consumers revenue separately from the Load Forecast and are discussed in Section 4.0 below.

The 2014 Electric Load Forecast projects that average annual growth in Manitoba load will be 1.8% for gross firm energy and 1.6% for gross total peak over the 10-year forecast period to 2023/24 (compared to 1.4% for both in IFF13). Gross firm energy supplied to the Manitoba load is projected to grow from 25 639 GW.h in 2014/15 to 29 626 GW.h by 2023/24. Over the same 10-year period, total system peak is projected to grow from 4 716 MW in 2014/15 to 5 400 MW in 2023/24. The 20-year average growth is expected to slow to 1.5% for gross firm energy and 1.3% for gross total peak by 2033/34. The system load factor is projected to remain relatively constant between approximately 62% and 63%.

Compared to the 2013 forecast, gross firm energy is projected to be up 614 GW.h (nearly 1½ year's load growth) by 2023/24 primarily due to increases in the pipeline sector as well as increases in the mass market sector due to a higher residential customer forecast in the short term. Over the longer term, the increase in gross firm energy is expected to be reduced to 129 GW.h (less than half a year's load growth) by 2032/33 due to a lower residential customer forecast in the longer term and an increase in the projected impacts of codes and standards. The gross total peak forecast is 104 MW higher in 2023/24 and 28 MW lower than the 2013 forecast in 2032/33, for similar reasons as the change in energy.

Over the 20-year forecast period, the impact of the change in the load forecast compared to IFF13 (before energy and capacity savings from incremental DSM) is minimal.

4.0 DEMAND SIDE MANAGEMENT

IFF14 incorporates the demand side management domestic customer energy and demand savings and investments forecast in the 2014-2017 Power Smart Plan and 15 year supplemental forecast. The Power Smart Plan, endorsed by the Province of Manitoba, sets out to realize electricity savings of 1 136 MW and 3 978 GW.h, natural gas savings of 108 million cubic meters and combined global greenhouse gas emission reductions of 2.9 million tonnes by 2028/29. This activity represents 12.7% of the estimated electric load forecast offsetting 66% of projected load growth during this period and 5.3% of the estimated natural gas volume forecast by 2028/29, further reducing natural gas consumption in Manitoba.

Combined with energy savings achieved to date, total electrical savings of 1 635 MW and 6 286 GW.h and total natural gas savings of 211 million cubic meters will be realized by 2028/29. These combined energy savings are expected to result in an overall reduction of greenhouse gas emissions of 4.6 million tonnes by 2028/29. This activity represents 20.1% of the estimated electric load forecast and 10.2% of the estimated natural gas volume forecast by 2028/29.

The projected cost of demand side management included in IFF14 is $1.2 billion over the 20-year period to 2033/34 or $0.9 billion greater than IFF13.

Overall, the forecast of General Consumers Revenue in IFF14 is $3.3 billion lower compared to IFF13 due mainly to the projected energy and capacity savings resulting from DSM as well as the lower rate increase approved for 2014/15 and lower projected indicative rate increases from 2031/32 to 2033/34.

5.0 EXTRA-PROVINCIAL REVENUE

IFF14 includes the following long-term firm export sales:

Northern States Power 150 MW Seasonal Diversity	To April 2015
Northern States Power 200 MW Seasonal Diversity	To April 2016
Northern States Power 500 MW Power Sale	To April 2014
Minnesota Power 50 MW System Participation Sale	May 2009 to April 2015
Minnesota Power 50 MW System Participation Sale	May 2015 to May 2020
Minnesota Power 250 MW System Participation Sale	June 2020 to May 2035
Great River Energy 150 MW Seasonal Diversity Sale	May 1995 to April 2015
Great River Energy 200 MW Seasonal Diversity Sale	May 2015 to March 2030
Northern States Power 125 MW System Power Sale	May 2021 to April 2025
Northern States Power 375/325 MW System Power Sale	May 2015 to April 2025
Northern States Power 350 MW Seasonal Diversity Sale	May 2015 to April 2025
Wisconsin Public Service 100 MW Sale	June 2021 to May 2027
Wisconsin Public Service 108 MW System Participation	June 2014 to May 2021
SaskPower 25 MW System Participation Sale	November 2015 to May 2022
American Electric Power 50 MW ZRC	May 2016 to May 2018
NextEra 10 MW Sale	June 2014 May 2015
NextEra 40 MW Sale	June 2015 to May 2016
NextEra 100 MW Sale	June 2016 to May 2018

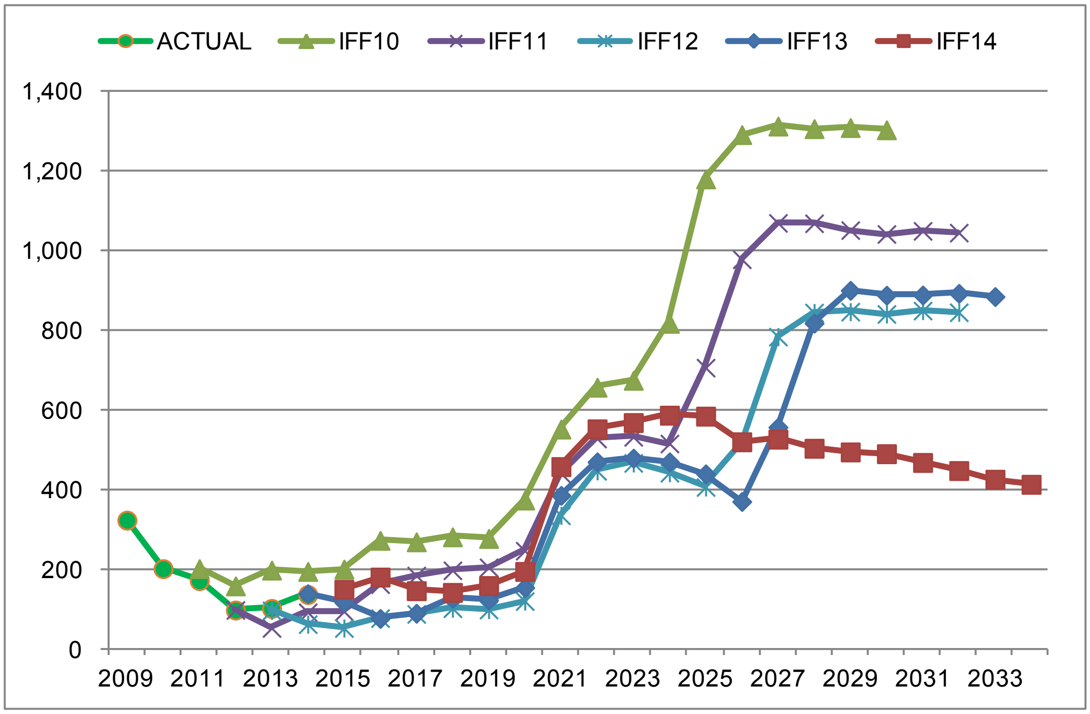
Extra-provincial sales volumes are forecast for the first forecast year (2014/15) based upon the expected inflow conditions as of October 2014 and actual reservoir and lake level elevations as of September 2014. The second forecast year (2015/16) uses the median of 80 years of historic inflows and initial reservoir and lake level elevations carried forward from the 2014/15 forecast. For 2016/17 and subsequent years, the projections are determined by averaging the revenues using flow conditions for the past 102 years (1912/13 to 2013/14).

Over the 20-year forecast period, net extra-provincial revenue (extra-provincial revenue net of water rentals and fuel and power purchased) decreases $2.0 billion compared to IFF13. The decrease is mainly due to the suspension of Conawapa in IFF14 as well as slightly lower forecasted export prices. This decrease is partially offset by higher volumes of energy available for export as a result of a reduction in the Manitoba domestic load forecast through increased DSM programs and higher forecasted US-CDN exchange rates.

The following Figure 5-1 shows the comparative net extra-provincial revenues from IFF10 through IFF14.

Figure 5-1: Extra-provincial Revenues

(Net of Water Rentals and Fuel and Power Purchases)



In comparison to the 2013 Electric Export Price Forecast, the 2014 forecast projects prices for a long term dependable electricity product will be, on average, 7% lower over the period 2016/17 to 2035/36. Over that time horizon energy prices (both on and off peak) are forecast to be an average of 3% lower with the value of capacity down 15% relative to the 2013 outlook. The decrease reflects the forecast for lower natural gas prices, with a minor offset due to the stabilizing effects of relatively flat year over year coal and carbon price forecasts, along with some additional clarity on US environmental regulation and resulting coal fleet retirements.

6.0 ELECTRICITY SUPPLY

Manitoba Hydro's 2014/15 Power Resource Plan indicates new generation is required by 2038/39 to meet the current projection of Manitoba load requirements under dependable energy conditions. New capacity resources are forecast to be required by 2037/38.

The following resources contribute to the ability to meet future Manitoba energy and capacity requirements.

	MW	Dependable GW.h	In-Service Date
HVDC Bipole III Line & 2300 MW of Converter Capability	80	177	2018/19
Keeyask	695	3 000	2019/20
Demand Side Management Program			
Planned Additional	582	2 797	By 2028/29

For IFF14 forecast purposes, it is assumed that Conawapa has been suspended and replaced with a gas turbine required in 2037/38 to meet firm capacity requirements. While the majority of planning and licensing activities on Conawapa have been suspended, Manitoba Hydro continues to pursue dependable firm export sales based on the earliest possible in-service date of Conawapa in 2029/30 and will re-evaluate the business case (currently anticipated by the Fall of 2016).

7.0 INTERNATIONAL FINANCIAL REPORTING STANDARDS (IFRS)

In February of 2013, the Canadian Accounting Standards Board (AcSB) extended the optional IFRS transition date for rate-regulated entities an additional year to January 1, 2015 in consideration of the commitment of the International Accounting Standards Board (IASB) to review issues related to rate-regulated accounting. Manitoba Hydro has adopted the optional transition date deferral and will be transitioning to IFRS effective April 1, 2015 for its 2015/16 fiscal period with comparative information presented for 2014/15.

On January 30, 2014, the IASB issued a new interim standard IFRS 14 Regulatory Deferral Accounts which is effective January 1, 2016 with early adoption permitted. The interim standard allows rate-regulated entities to continue to recognize regulatory deferral accounts (i.e. regulatory assets and liabilities) upon transition to IFRS. The intent of the standard is to provide temporary guidance until the IASB completes its comprehensive project on Rate-regulated Activities which is expected to take several years.

Manitoba Hydro will early adopt IFRS 14 upon its April 1, 2015 transition and as such, will continue to recognize its regulated assets and liabilities upon transition to IFRS. While it is uncertain as to the final position the IASB will take as part of its comprehensive Rate-regulated Activities project, it has been assumed in IFF14 that regulatory deferral accounts will continue to be recognized throughout the forecast period to 2033/34.

Generally speaking, the transition to IFRS will result in timing differences between when expenditures are recognized into income between Canadian Generally Accepted Accounting Principles (CGAAP) and IFRS. Manitoba Hydro recognizes that the different financial reporting requirements under IFRS will both increase and decrease annual net income. As such, Manitoba Hydro has considered the range of potential impacts and where possible, has selected accounting policies aimed at minimizing the overall impact to net income and customer rates.

The primary impacts of IFRS that are included in IFF14 are as follows:

- Administrative and other general overhead costs are not eligible for capitalization under IFRS and must be expensed as incurred;
- IFRS is more rigorous in terms of the componentization of assets and the recognition of gains and losses on the disposal/retirement of assets and does not allow the inclusion of asset retirement costs in depreciation rates; and
- Unamortized experience gains and losses on pension balances will be reclassified to accumulated other comprehensive income (AOCI) upon transition to IFRS.

The following table Figure 7-1 outlines the projected IFRS impacts to retained earnings, AOCI and net income:

Figure 7-1: IFRS Impacts on Retained Earnings and Net Income

IFRS Impacts
Increase/(Decrease)

($Millions)

	Retained Earnings	AOCI	Net Income 2015/16
Capital Taxes	-	-	3
Administrative Overhead	(56)	-	(57) *
Pension & Employee Benefits	(24)	(445)	3
Meter Compliance, Exchange and Sampling	-	-	5
Removal of Negative Salvage	62	-	64
Change to Equal Life Group Depreciation	(36)	-	(38)
Total	**(54)**	**(445)**	**(20)**

*Impacts to net income are net of depreciation & amortization.

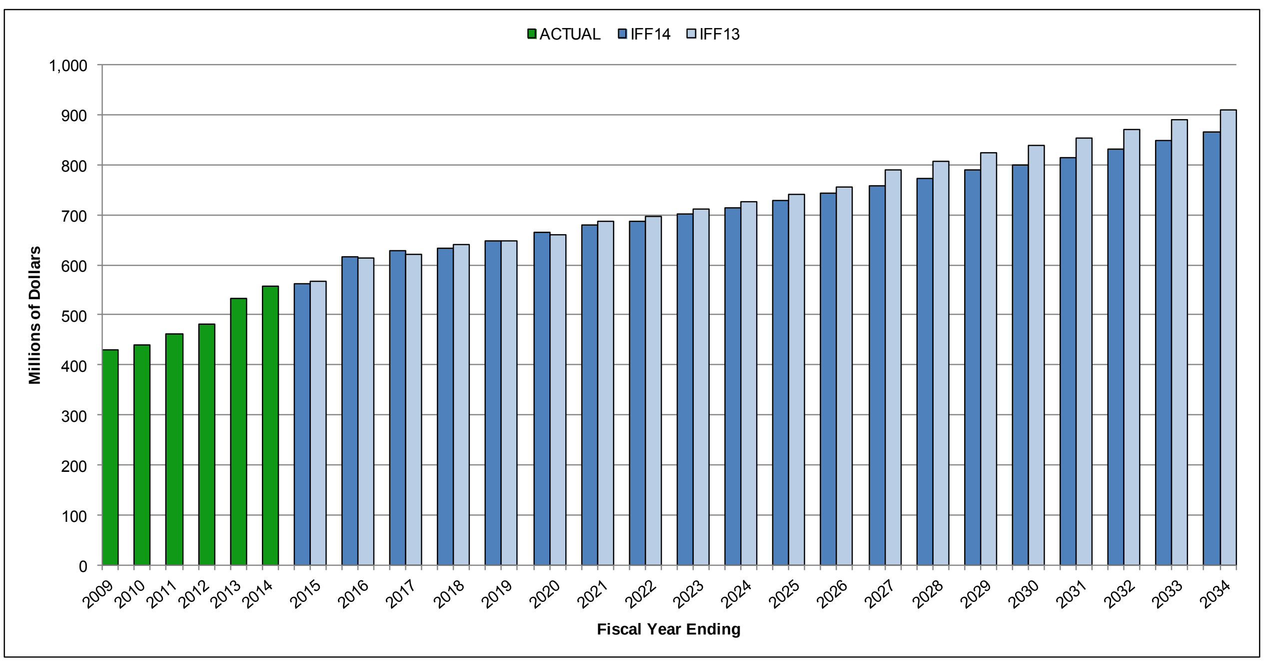
8.0 OPERATING & ADMINISTRATIVE EXPENSE

Operating, Maintenance & Administrative (OM&A) Expenses in IFF14 include only those expenditures necessary to provide for the safe and reliable operation and maintenance of the generation, transmission and electric and gas distribution systems.

Figure 8-1 below shows the OM&A expense projected in IFF14 compared to IFF13. On an overall basis, OM&A remains relatively unchanged from IFF13. IFRS adjustments remain in place beginning 2015/16 and more aggressive cost containment measures continue to be implemented to keep costs below inflationary levels. Reductions in the later years are due to a reclassification of Great Northern Transmission Line costs to Fuel and Power Purchases for IFF14, as well, as the deferral of Bipole III for one year and suspension of Conawapa.

For the period from 2014/15 to 2021/22, it is assumed that OM&A cost increases, excluding accounting changes, will be limited to below inflationary levels of 1%. This is an advancement of one year compared to IFF13 which assumed the 1% escalation commenced in 2015/16. For the remainder of the forecast, OM&A rises at the same level as inflation except in years where major new generation and transmission comes into service in 2018/19 (Bipole III), 2019/20 (Keeyask) and 2020/21 (500kV tie line). Increases associated with load growth over the forecast period are assumed to be achieved through continuing productivity improvements.

Figure 8-1: Operating, Maintenance and Administrative Expense

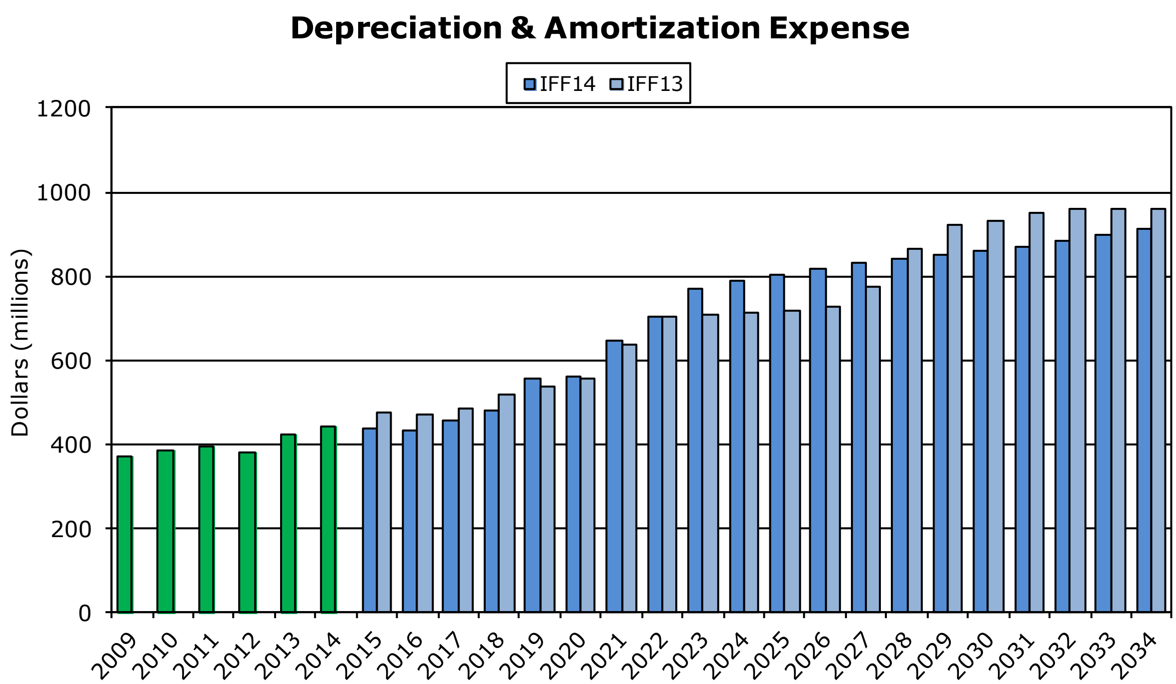


9.0 DEPRECIATION & AMORTIZATION EXPENSE

The Depreciation and Amortization Expense included in IFF14 is based on a comprehensive depreciation study that was completed in October 2014.

Figure 9-1 below provides a comparison of the Depreciation and Amortization Expense between IFF14 and IFF13. Depreciation and Amortization Expense is $0.2 billion lower in IFF14 over the 20-year forecast period compared to IFF13 primarily due to the reduction in depreciation rates resulting from updated asset service lives as recommended in the depreciation study (decrease of $0.9 billiion), as well as the suspension of Conawapa (decrease of $0.9 billion). This reduction is largely offset by the higher capital costs of Bipole III, DSM and Major and Base Capital Expenditures (increase of $1.5 billion).

Figure 9-1: Depreciation and Amortization Expense



10.0 WUSKWATIM POWER LIMITED PARTNERSHIP

IFF14 assumes that the Nisichawayasihk Cree Nation (NCN) will acquire up to a 33% common unit ownership interest in the Wuskwatim Power Limited Partnership (WPLP). The WPLP will operate and maintain the Wuskwatim generating station and Manitoba Hydro will purchase all of the generation under the terms of the Wuskwatim Project Development Agreement (PDA) signed by Manitoba Hydro and NCN in 2006. Manitoba Hydro's income statement reflects all of the partnership revenues and costs with non-controlling interest representing NCN's share of the projected net income or losses in WPLP (shown as a deduction or addition before net income, respectively). The partnership's net assets are offset by an amount for NCN's non-controlling equity interest on Manitoba Hydro's balance sheet.

During 2014, Manitoba Hydro and NCN reached an agreement in principle with respect to Wuskwatim PDA Supplement #2. IFF14 assumes the terms of the agreement in principle commencing in 2014/15. The projected net impact to Manitoba Hydro averages approximately $15 million per year over the 20-year forecast period.

It is expected that the agreement in principle will be finalized into a legally binding agreement over the next several months.

11.0 KEEYASK HYDROPOWER LIMITED PARTNERSHIP

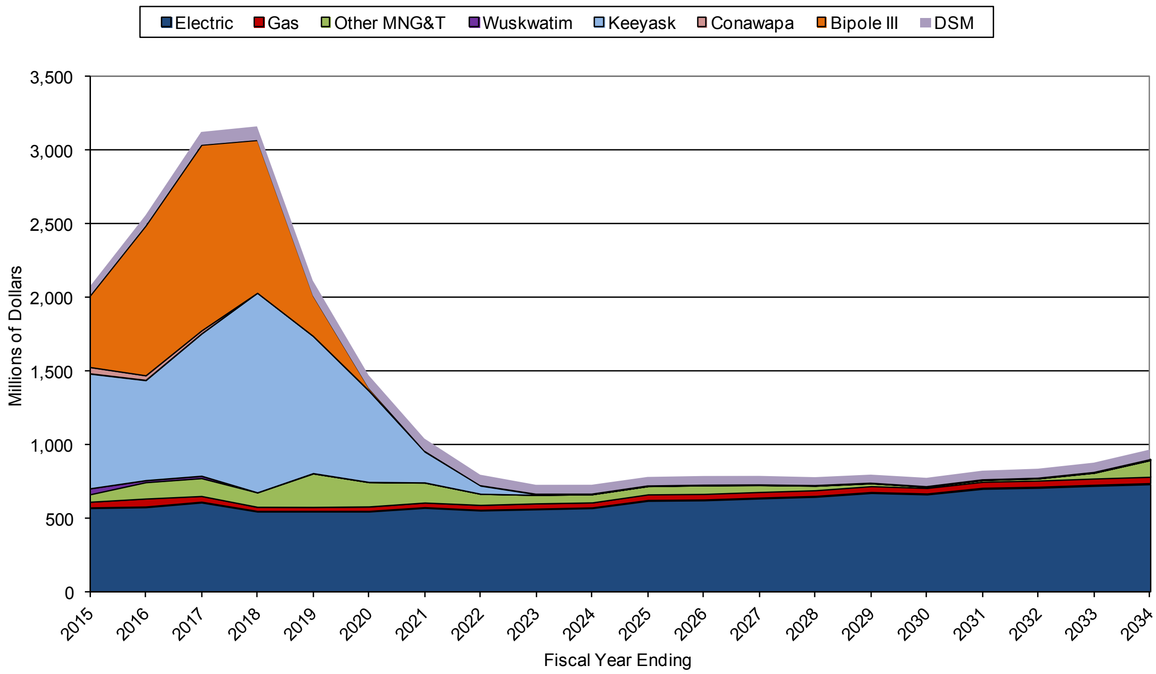
The Keeyask Cree Nations (KCN's), including Tataskweyak Cree Nation and War Lake First Nation (operating together as Cree Nation Partners), Fox Lake Cree Nation and York Factory First Nation, have the right to acquire up to 25% in the Keeyask Hydropower Limited Partnership (KHLP). The partnership will construct, operate and maintain the Keeyask generating station and Manitoba Hydro will purchase all of the generation under the terms of the Joint Keeyask Development Agreement (JKDA) signed by Manitoba Hydro and the KCN's in 2009. Manitoba Hydro's income statement reflects all of the partnership revenues and costs. The partnership's net assets are offset by an amount for the KCN's non-controlling equity interest on Manitoba Hydro's balance sheet.

IFF14 assumes the KCN's will hold a 17.5% common ownership interest up to the in-service of the final Keeyask generating unit and then elect to invest in the preferred ownership option. The preferred distributions to the KCN's have been reclassified as an expense (fuel & power purchases) in IFF14 from non-controlling interest in previous forecasts.

12.0 CAPITAL EXPENDITURE FORECAST

Capital expenditures are forecast to be $17.8 billion to 2023/24 and $26.0 billion to 2033/34. Figure 12-1 below illustrates projected capital expenditures by major category.

Figure 12-1: Capital Expenditure Forecast CEF14



The CEF14 includes Major New Generation & Transmission projects which increase capacity and energy or provide increased reliability. In August 2013, the Province of Manitoba issued an Environmental Act licence for the Bipole III Reliability project and construction has commenced with a planned in-service date of 2018/19. In July 2014 the Province of Manitoba issued an Environmental Act licence for the Keeyask Generating Station and construction has commenced with a planned in-service date of 2019/20. Manitoba Hydro continues to develop the Manitoba-Minnesota Transmission Project, a transmission interconnection into the U.S. which supports enhanced export capability, reliability and drought risk mitigation. The Province also endorsed Manitoba Hydro’s new, more aggressive demand side management PowerSmart plan which targets a 250% increase in consumption savings.

For IFF14 forecast purposes, it is assumed that Conawapa has been suspended and replaced with a gas turbine required in 2037/38 to meet firm capacity requirements. While the majority of planning and licensing activities on Conawapa have been suspended, Manitoba Hydro continues to pursue dependable firm export sales based on the earliest possible in-service date of Conawapa in 2029/30 and will re-evaluate the business case (currently anticipated by Fall 2016).

Over the 10-year forecast to 2023/24, capital expenditures are $3.4 billion lower compared to the previous capital expenditure forecast (CEF13). The decrease is mainly due to the suspension of Conawapa. In addition, reductions have been identified for the Gillam Redevelopment and Expansion program, deferral of the Slave Falls Overhaul project, and the cancellation of the Dorsey 230 kV Zone Building and Firm Import Upgrades projects. These decreases in the 10-year forecast period are partially offset by increases in sustaining capital expenditures and DSM expenditures as well as Bipole III and Keeyask projects.

Over the longer term to 2033/34, capital expenditures are $7.5 billion lower compared to CEF13 due to the suspension of Conawapa and deferral of the Pointe du Bois Powerhouse Rebuild project. The decrease is partially offset by increased expenditures for sustaining infrastructure, Bipole III, DSM and Keeyask as previously indicated for the 10-year period.

The following Table 12-1 provides a summary of CEF14 and the revisions from CEF13.

Table 12-1: Summary of Projected Capital Expenditures

	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	10 Year Total
CEF13	2,062	2,483	2,543	2,358	2,061	1,878	1,372	1,755	2,319	2,359	21,191
Incr (Decr)	9	73	580	803	52	(408)	(333)	(962)	(1,595)	(1,635)	(3,416)
CEF14	2,071	2,556	3,124	3,161	2,113	1,470	1,039	793	724	724	17,774

	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	20 Year Total
CEF13	2,162	2,048	1,838	1,399	1,098	922	828	680	630	679	33,474
Incr (Decr)	(1,384)	(1,264)	(1,054)	(623)	(305)	(151)	(8)	154	245	285	(7,521)
CEF14	778	784	785	776	793	771	820	834	875	963	25,953

The following Table 12-2 provides a summary of the total changes to the 10 and 20-year forecast.

Table 12-2: Summary of CEF14 Project Increases/(Decreases)

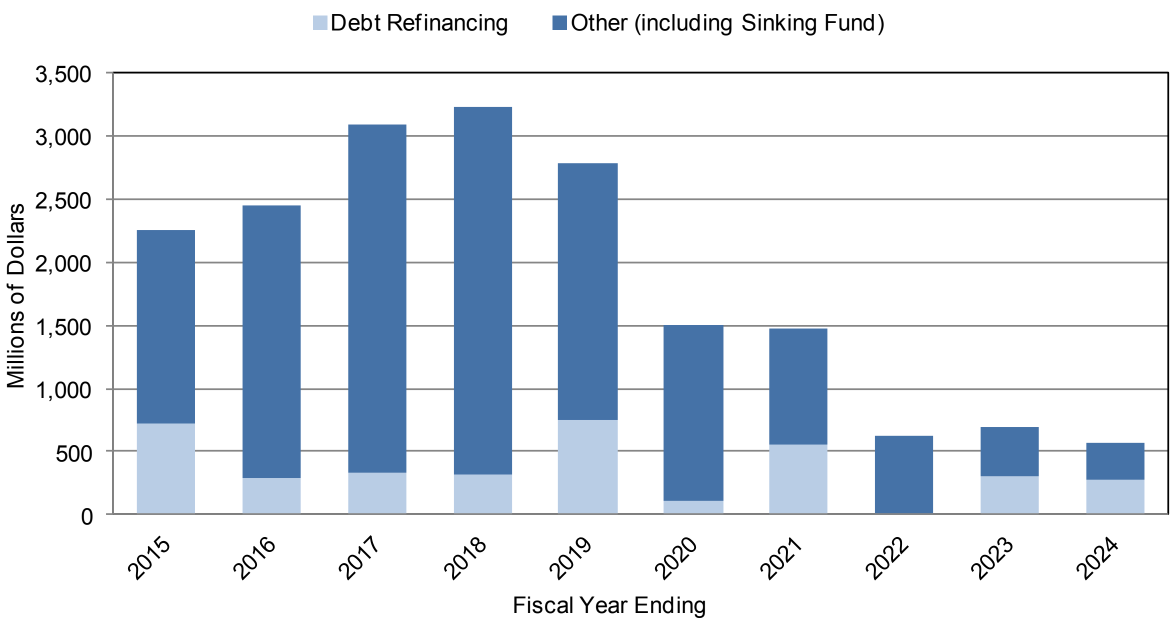
	Total Projected Cost	10 Year Increase (Decrease)	20 Year Increase (Decrease)
	($ Millions)		
Conawapa - Generation	397	(6,052)	(10,065)
Base Capital Target	NA	422	1,957
Pointe du Bois Powerhouse Rebuild	1,852	(19)	(1,471)
Bipole III - Converter Stations	2,675	881	881
Demand Side Management *	NA	463	802
Additional North South Trasmission	-	(90)	(475)
Bipole III - Transmission Line	1,655	407	407
Keeyask - Generation	6,496	349	349
Gillam Redevelopment and Expansion Program	266	(77)	(100)
Gas Demand Side Management *	NA	50	92
Bipole III - Collector Lines	260	71	71
Dorsey 230KV Zone Building	-	(63)	(63)
New Adelaide Station - 66/12kV	62	62	62
Slave Falls Major Overhauls	126	(63)	-
Other System Upgrades		243	32
		(3,416)	(7,521)

* Assumes that Demand Side Management expenditures will continue to be capitalized upon adoption of IFRS in 2015/16 under the interim standard that continues to permit rate regulated accounting.

13.0 BORROWING REQUIREMENTS

Manitoba Hydro's forecast consolidated borrowing requirements are portrayed in Figure 13-1 below.

Figure 13-1: Projected Consolidated Borrowing Requirements



Manitoba Hydro arranges long-term financing in the form of advances from the Province of Manitoba. Both long and short-term borrowings are guaranteed by the Province (except for mitigation bonds issued by the Manitoba Hydro-Electric Board). Manitoba Hydro's interest rate policy on its existing debt portfolio is to limit the aggregate of: i) floating rate debt, ii) short term debt, and iii) fixed rate long term debt to be refinanced within the subsequent 12 month period; to a maximum of 35% of the total debt portfolio. Manitoba Hydro's interest rate risk guidelines for its existing debt portfolio include maintaining an aggregate of floating rate debt and short term debt within 15 – 25% of the total debt portfolio, and having the fixed rate long term debt to be refinanced within a 12 month period being less than 15% of the total debt portfolio.

14.0 NATURAL GAS DEMAND & SUPPLY

The Corporation sells primary gas to Manitobans in a market which also includes a small number of brokers and marketers, and is the gas distribution utility for all customers in Manitoba. Currently, approximately 94% of customers representing approximately 62% of volumes purchase their primary gas requirements from Manitoba Hydro, with the balance using brokers and marketers through the Western Transportation Service.

The volume forecast incorporates Manitoba Hydro's Fixed Price Offering for primary gas, which was introduced in 2008/09 and offers customers one, three, and five-year fixed price contracts.

The forecast incorporates the transportation and supplementary gas requirements, not only for Manitoba Hydro's customers but also for those consumers who purchase their primary gas from brokers and marketers.

The total natural gas sales volume forecast decreases 40 million cubic meters (1.9%) from 2013/14 to 2014/15 and continues to decrease by 6.5 million cubic meters (0.3% per year) to 2023/24. The decrease is primarily attributed to a change in the expected average use across all customer sectors, by reducing their non-process related natural gas usage due to conversions to high efficiency furnaces, improvements in insulation levels and conversion of Residential sector from natural gas to electric water heaters.

15.0 FINANCIAL TARGETS

Manitoba Hydro has the following financial targets for consolidated operations:

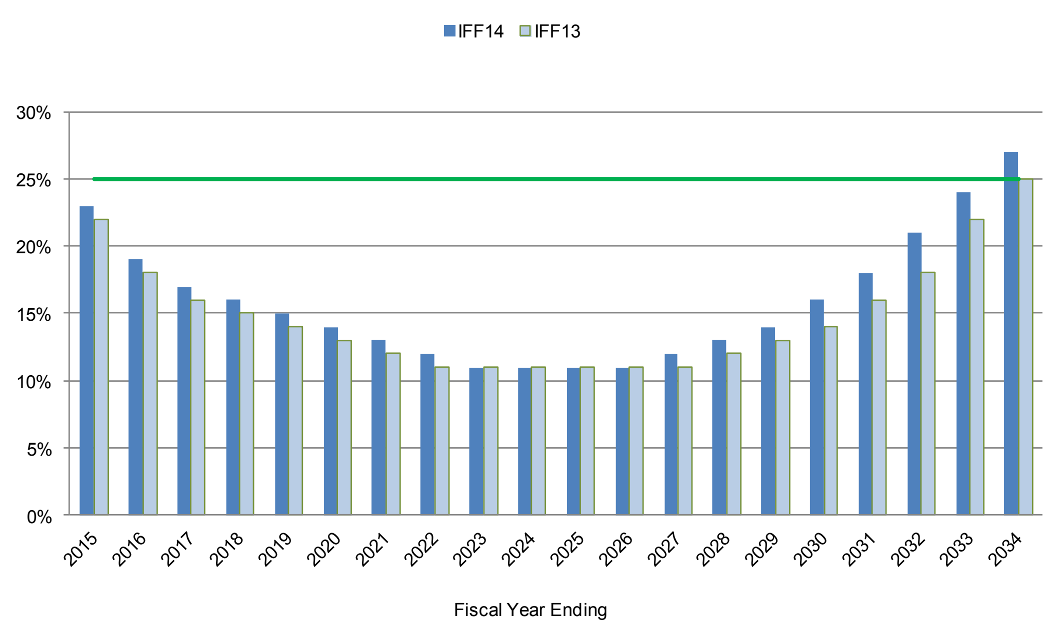
Debt/Equity Ratio	Achieve and maintain a minimum debt/equity ratio of 75:25
Interest Coverage	Maintain an annual gross interest coverage ratio of greater than 1.20
Capital Coverage	Maintain a capital coverage ratio of greater than 1.20 (excepting major new generation and transmission)

Financial targets may not be achieved during years of major investment in the generation and transmission system.

15.1 Debt/Equity Ratio

The debt/equity ratio indicates the portion of Manitoba Hydro's assets that have been financed by internally generated funds rather than through debt. Figure 15-1 below shows the projected consolidated equity ratio for IFF14 compared to IFF13. High levels of capital investment over the next ten years combined with reduced revenues result in deterioration of the equity ratio to 11% by 2022/23. The equity ratio shows improvement following the in-service of Keeyask and is projected to return to the target 25% by the end of the 20-year forecast period in 2033/34 (same year as in IFF13).

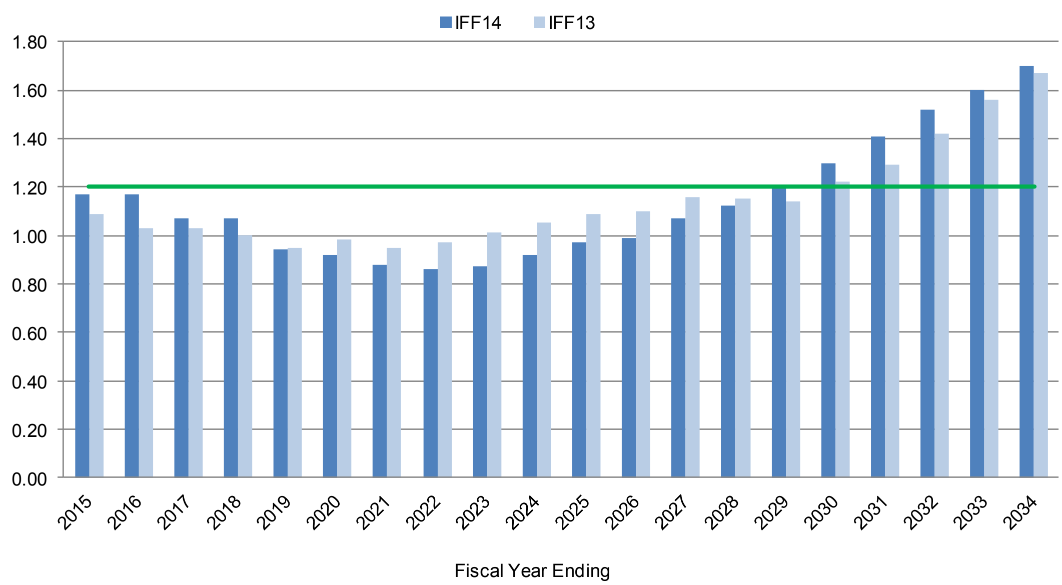
Figure 15-1: Projected Consolidated Equity Ratio



15.2 Interest Coverage Ratio

The interest coverage ratio provides an indication of the ability of the Corporation to meet interest payment obligations with the net income generated by the Corporation. Figure 15-2 below shows that the reduction in net income compared to the previous forecast IFF13 and increase in capital requirements for Bipole III, Keeyask, DSM and to replace aging infrastructure results in interest coverage ratios lower than target for a period of fourteen years. In the longer term, interest coverage is projected to return to the 1.20 target level by 2028/29.

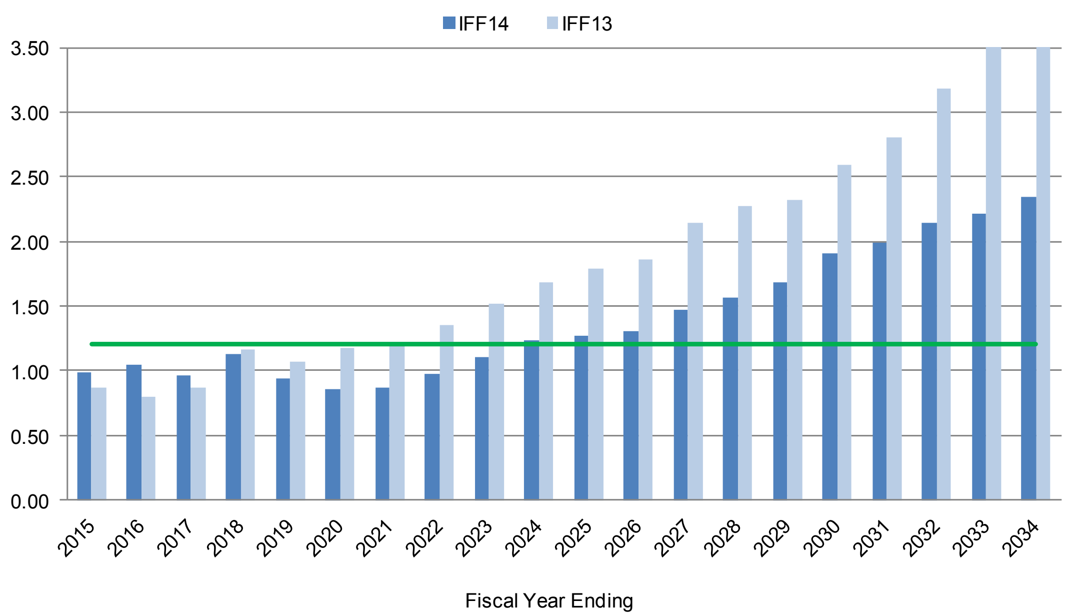
Figure 15-2: Projected Consolidated Interest Coverage Ratio



15.3 Capital Coverage Ratio

The capital coverage ratio measures the ability of current period internally generated funds to finance sustaining capital expenditures (excluding major new generation and related transmission). Figure 15-3 below shows the comparative capital coverage ratios between IFF14 and IFF13. Capital coverage is below target for the first nine years of the forecast due to the reduction in net income and increasing capital requirements to replace aging infrastructure. Thereafter, projected cash flows are sufficient to enable this target to be met in the remaining years of the forecast after the in-service of the Keeyask Generating Station.

Figure 15-3: Projected Consolidated Capital Coverage Ratio



16.0 SENSITIVITY ANALYSIS

The 20-Year Financial Outlook includes a number of key assumptions as described in the previous sections. A change to one or more of those assumptions could have a significant impact on projected financial results. This section provides an indication of the financial impact of changes in the following assumptions:

- Domestic load growth
- Interest rates
- Foreign exchange rates
- Export prices
- Capital expenditures
- Water flow conditions
- Rate Increases

Table 16-1 below shows the change in retained earnings and incremental even annual rate increases/(decreases) required to achieve the same level of retained earnings in 2023/24 as forecast in IFF14.

Table 16-1: Financial Impacts of Sensitivity Analysis

	2016/17	2020/21	2023/24	
	Incremental Increase/(Decrease) in Retained Earnings (in millions of dollars)			Incremental Annual Electric Rate Increase/(Decrease)
Low Domestic Load Growth	(4)	(24)	(32)	0.04%
High Domestic Load Growth	(4)	54	65	-0.08%
+ 1% Interest	(47)	(423)	(1,071)	1.27%
- 1% Interest	45	398	987	-1.31%
C$/US$ Down 0.10 (C$ Strengthening)	5	(3)	(159)	0.20%
C$/US$ Up 0.10 (C$ Weakening)	(5)	3	159	-0.20%
Low Export Price	(44)	(304)	(704)	0.88%
High Export Price	28	245	626	-0.81%
5 Year Drought (starting in 2016/17)	N/A	(1,711)	N/A	2.43%
+ 1% Rate Increase in 2016	31	116	206	-0.26%
- 1% Rate Increase in 2016	(31)	(115)	(200)	0.26%
Capital Down $50 million/year	7	85	206	-0.26%
Capital Up $50 million/year	(7)	(85)	(205)	0.26%

16.1 Domestic Load Growth Sensitivity

The 2014 Electric Load Forecast is prepared with the expectation that there is a 50% chance that actual Manitoba energy requirements could be higher or lower than forecast. To evaluate the potential variation in the load forecast due to long term economic effects, 10% and 90% confidence bands (±1.28 standard deviations) were selected to represent proxies for the low and high load forecast scenarios. The variability in gross firm energy could be ±1 093 GW.h by 2023/24 or ±261 MW in system peak energy.

Historically, domestic load requirements higher than forecast would result in greater adverse financial impacts than lower domestic loads due to the higher value of opportunity export sales compared to domestic revenues. With the weakening of forecast electricity export prices compared to previous forecasts, wholesale market export and domestic retail average rates have inverted and the resulting revenue impacts are positive to Manitoba Hydro over the 10-year forecast. In the high domestic load growth scenario, net income impacts in the near term (to 2019/20) that are greater in absolute terms than the net income impacts under the low domestic load growth scenario. This is due to the availability of Brandon until its decommissioning date in 2019/20 to supply firm Manitoba load (which is not available to supply firm export sales). Brandon would be dispatched before displacing uncommitted firm sales which are limited over this period.

Under low load growth, the reduction to revenues is greater than the increase in export sales resulting in a net reduction to revenues and net income.

16.2 Interest Rates Sensitivity

Interest rates assumed in IFF14 are projected to rise gradually over the first six years of the forecast. The interest rate sensitivity indicates the financial impacts of interest rates one percent higher or lower than forecast on short-term, long-term and floating rate debt, as well as sinking funds.

16.3 Foreign Exchange Rates Sensitivity

The Canadian dollar is projected to be weaken to $1.12 (C$/US$) over the first five years of the forecast and then is projected to slightly strengthen to $1.10 (C$/US$). In the short to medium term of the forecast, net income is relatively neutral to changes in the exchange rate, due to the effective hedge provided by Manitoba Hydro's foreign exchange policy. The exchange rate sensitivity indicates the financial impacts of the C$/US$ exchange rate being 0.10 higher (C$ weakening) or lower (C$ strengthening) than forecast.

16.4 Export Prices Sensitivity

IFF14 reflects the expected electricity export prices derived from several independent price forecasts for the Midwest independent System Operator (MISO) region. Each price forecast consultant has their own electricity price forecast models, assumptions and view of the future. In preparing their forecasts, the consultants prepare their own internal estimates for a number of pricing factors. These factors include:

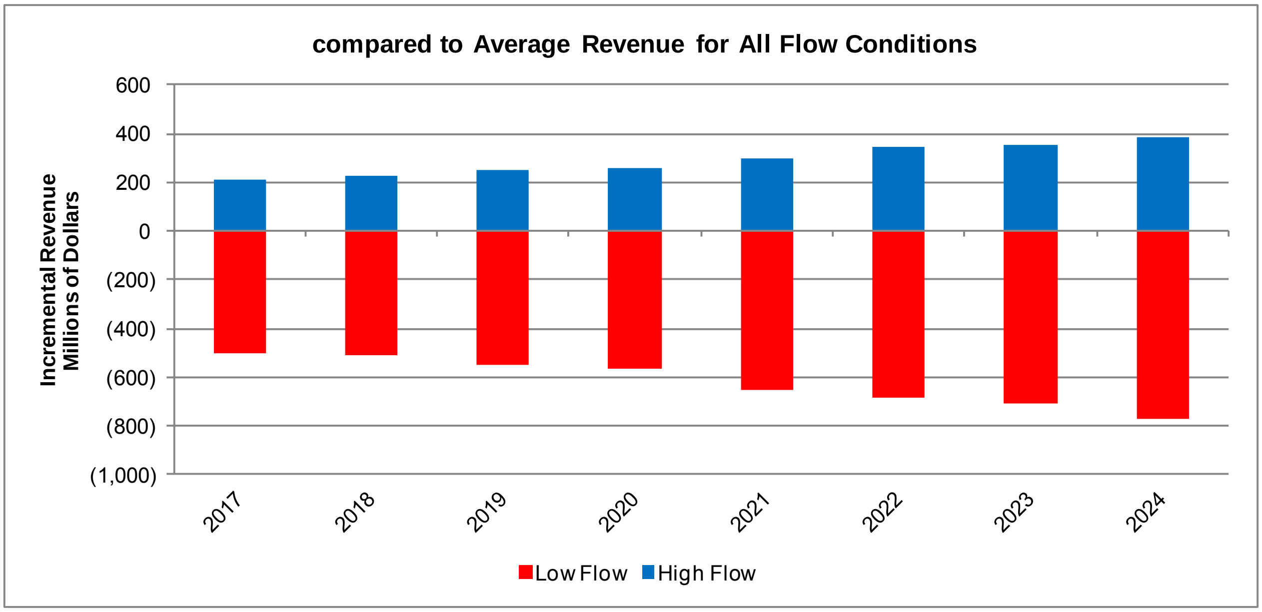
- Thermal fuel forecasts (coal and natural gas);
- Future load growth forecasts;
- Profile of existing generation (fuel type, efficiency and operating parameters);
- Profile of potential new generation (fuel type, efficiency, capital cost and required rates of return);
- Generation requirements;
- Power market rules; and
- Future regulation/legislation related to SO2 (sulfur dioxide), NOX (nitrous oxide), Hg (mercury) and CO2 (carbon dioxide) emissions, as well as cooling water releases and coal ash handling.

There is uncertainty in each of these factors, and particular uncertainty as to how future legislative requirements may evolve. In addition to the expected case, forecast consultants provide high and low price cases with their views of potential long-term lower and higher variations from expected export prices. The export price sensitivities provided in this analysis reflect these low and high export price cases, coupled with low and high natural gas prices.

16.5 Drought/Water Flow Sensitivity

IFF14 reflects the average revenues and expenses of 102 different potential system inflow conditions that occurred historically from 1912/13 to 2013/14. Although the forecast inherently includes the revenues and expenses associated with both the highest and lowest inflow conditions, the actual inflow could vary significantly from forecast in any given year as shown in Figure 16-2. The impact of low flows are greater than high flows due to the requirements for thermally generated and imported energy in low flow years and spilling of water beyond system constraints in high flow years.

Figure 16-2: Variability of Net Interchange Revenue



A prolonged period of low flows has a significant financial impact. The current estimate of a recurrence of the historic five-year drought from 1987/88 to 1991/92 is approximately $1.7 billion by the end of the drought period in 2020/21. This represents the deviation in net interchange revenues and generation costs if the five-year drought begins in 2016/17 compared to the average net revenues resulting from all historic flow cases. The costs of drought could rise under a scenario of higher electricity export and thermal fuel prices.

16.6 Rate Increase Sensitivity

Table 16-1 indicates the financial impact of a +/-1% change in the proposed electric rate increase in 2015/16 and demonstrates that required even annual rate increases of 3.95% will increase or decrease by +/- 0.26% over the remaining eight years to 2023/24.

16.7 Capital Expenditure Sensitivity

The capital expenditure sensitivity reflects the financial effects of inflationary or deflationary changes to Major & Base Capital relative to general inflation levels and/or reduction or increases to expenditures necessary to meet reliability, regulatory or customer requirements.

APPENDIX 3.5: ALTERNATE RATE SCENARIOS

The 3.95% proposed and indicative rate increases in MH14 are the minimum necessary to manage the significant deterioration in Manitoba Hydro's projected financial results and ratios in the next 10 year period and are vital to rate stability for customers and the continued financial strength of Manitoba Hydro.

Figure 3.5.1 shows the impacts to key financial indicators at the end of the 10 year period in 2023/24 for alternate rate scenarios without the proposed and indicative 3.95% rate increases (Scenario A), with rate increases limited to inflationary adjustments (Scenario B), rate increases deferred to future periods (Scenarios C-F)**,** as well as higher near term rate increases to mitigate losses over the 10 year period and reduce future rate increases (Scenarios G-I).

Figure 3.5.1: Financial Impacts of Alternate Rate Increases by 2023/24

Projected Rate Increases	Retained Earnings ($Billions)	Debt to Equity Ratio	Interest Coverage Ratio	Capital Coverage Ratio
MH14- 3.95% 2016-2024	$2.0	90:10	0.91	1.22
A. 0.00% -2016-2024	($1.5)	104:(4)	0.39	(0.20)
B. 2.00% -2016-2024	$0.2	98:2	0.62	0.47
C. 2.00% -2016-2019, 3.95% thereafter	$0.7	95:5	0.76	0.84
D. 2.95% -2016-2019, 3.95% thereafter	$1.3	93:7	0.83	1.02
E. 2.00% -2016-2019, 7.94% thereafter	$2.0	90:10	1.09	1.66
F. 2.95% -2016-2019, 6.00% thereafter	$2.0	90:10	1.00	1.45
G. 5.00% -2016-2019, 3.00% thereafter	$2.4	89:11	0.92	1.24
H. 5.50% -2016-2019, 3.00% thereafter	$2.7	88:12	0.96	1.35
I. 6.00% -2016-2019, 3.00% thereafter	$3.1	86:14	1.00	1.45

The financial projections for each of the above alternate rate scenarios can be found in Attachments A to I of this appendix.

Scenario A in Figure 3.5.1 shows that without the 3.95% proposed and indicative rate increases throughout the 10 year forecast period to 2023/24, the Corporation's financial reserves would be totally depleted by 2022/23.

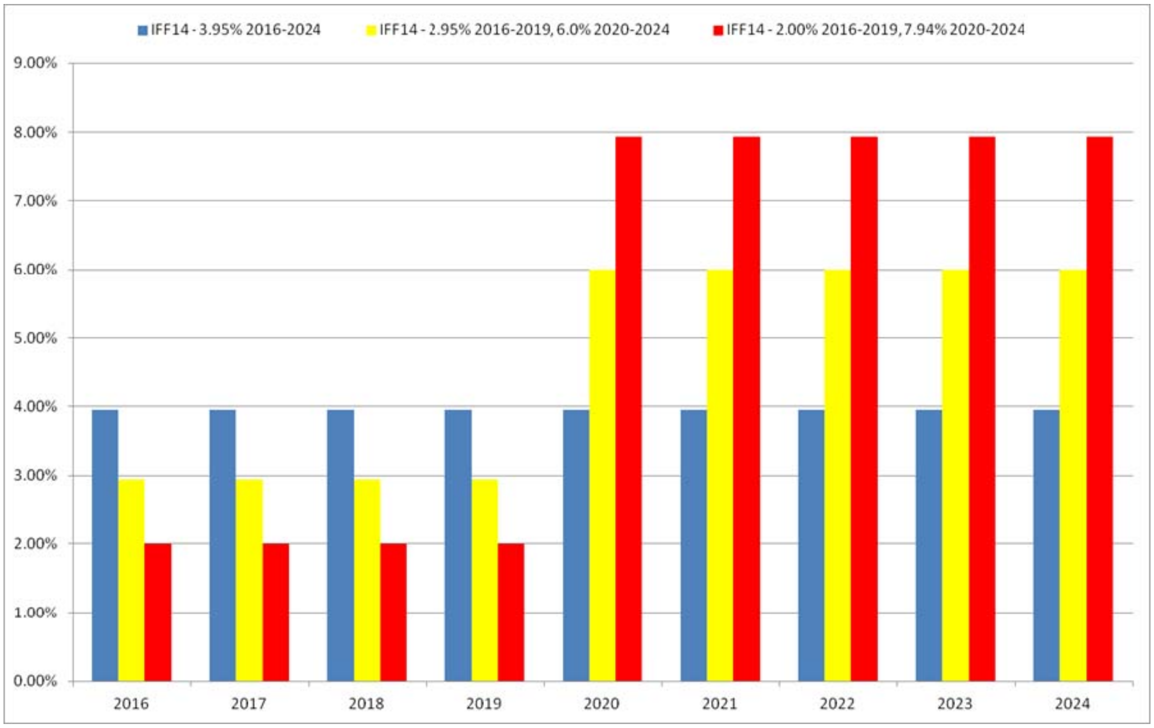
In Scenario B the rate increases are limited to inflationary levels (around 2%) over the 10 year forecast, Manitoba Hydro's assets are almost fully funded by debt and financial reserves are nearly completely depleted. The very weak interest coverage and capital coverage ratios indicate that the Corporation’s cash flow is negative and the shortfall is funded through increased borrowing. Under Scenario B, it is clear that the 2% rate increases cannot be sustained for a prolonged period of time.

Scenarios C and D assume reductions to the proposed and indicative rate increases of 3.95% in the first four years (2016-2019) to 2.0% and 2.95%, with no compensating rate increases in the period following the rate reductions (2020-2024). In these scenarios, the Corporation’s financial ratios and reserves deteriorate to unacceptable levels. Retained earnings deteriorate to a level that are significantly lower than the projected $1.7 billion cost of a five year drought. The projected equity ratio deteriorates to unacceptable levels of 5% and 7% by 2023/24 for Scenarios C and D, respectively. The projected interest coverage ratio under Scenario C is below 1.00 in all but the first two years of the ten year forecast period. Under Scenario D, the projected interest coverage is below 1.00 for the last six years of the ten year forecast period. Similarly, the projected capital coverage ratio is below 1.00 for most forecast years under both Scenarios C and D.

This level of deterioration indicates that projected cash flows under Scenarios C and D, are not sufficient to fund Manitoba Hydro’s operations or sustaining capital program and result in incremental borrowing at an unsustainable rate. Customers would be at significant risk of a rate shock, particularly if a drought or catastrophic infrastructure loss occurred.

In Scenarios E and F, Manitoba Hydro calculates the compensating rate increases that are required in the five year period from 2020 to 2024 associated with rate increases of 2.0% and 2.95% for the four year period from 2016 to 2019. Figure 3.5.2 below demonstrates that with 2% rate increases for the next 4 years, Manitoba Hydro would require 8% rate increases for the following five years (Scenario E), and with 2.95% rate increases for the next four years, Manitoba Hydro would require 6% rate increases in the five years that follow (Scenario F). This analysis demonstrates how future rate increases would have to increase, to compensate for lower rate increases obtained in the near-term.

Figure 3.5.2: Projected Rate Increase Scenarios



Considering the financial outlook as projected in MH14, there is financial justification for requesting rate increases in excess of 3.95%. In Scenarios G, H and I, Manitoba Hydro analyzed other alternate rate scenarios that involve higher rate increases.

Higher rate increases in the near term would assist in reducing the losses that are projected in the next 10 year period. This alleviates some of the downward pressure on the Corporation's projected financial ratios in the investment period and the risk of the significantly higher rate increases in the future in the event of a significant drought or other adverse financial conditions. Rate increases in the 5.50-6.0% level for the next four years (2016-2019) would be necessary to reduce losses and maintain financial reserves at current levels, and result in lower rate increases of 3.0% for the 2020-2024 period.

Despite the increased risk of higher than projected rate increases in the future, Manitoba Hydro has maintained the proposed rate increases at the 3.95% level in consideration of customer sensitivity to rate increases.

In order to ensure rate stability and predictability for customers, it is necessary that Manitoba Hydro maintains its financial strength. If Manitoba Hydro does not maintain a financially healthy utility by maintaining moderate and regular rate increases as proposed and projected, then there is significant risk to customers that rate changes will become more volatile. Consequently, there would be a need for sudden or larger rate increases in the near future. This risk is particularly acute in the upcoming period of extensive capital investment and reinvestment.

It is of vital importance that the rate increases be regular and occur even when there are short-term favorable water flow conditions in order to ensure rate stability and predictability for customers. In Manitoba Hydro’s view, gradually raising rates by the minimum 3.95% rate increases is in the customer’s best interest.

APPENDIX 3.6: SENSITIVITY ANALYSIS SCENARIOS

The Sensitivity Analysis included in IFF14 (Appendix 3.2, page 22) discusses the potential financial impacts of changes in key assumptions incorporated in IFF14. A change to one or more of the following assumptions could have a significant impact on projected financial results:

- Domestic load growth
- Interest rates
- Foreign exchange rates
- Export prices
- Capital expenditures
- Water flow conditions
- Rate Increases

Figure 3.6.1 below, reproduced from Appendix 3.2, shows the projected changes in electric operations retained earnings and incremental even annual rate increases/(decreases) required to achieve the same level of retained earnings in 2023/24 as forecast in IFF14.

Figure 3.6.1: Financial Impacts on Electric Operations of Sensitivity Analysis

	2016/17	2020/21	2023/24	
	Incremental Increase/(Decrease) in Retained Earnings (in millions of dollars)			Incremental Annual Electric Rate Increase/(Decrease)
Low Domestic Load Growth	(4)	(24)	(32)	0.04%
High Domestic Load Growth	(4)	54	65	-0.08%
+ 1% Interest	(45)	(416)	(1,057)	1.27%
- 1% Interest	43	392	975	-1.31%
C$/US$ Down 0.10 (C$ Strengthening)	5	(3)	(159)	0.20%
C$/US$ Up 0.10 (C$ Weakening)	(5)	3	159	-0.20%
Low Export Price	(44)	(304)	(704)	0.88%
High Export Price	28	245	626	-0.81%
5 Year Drought (starting in 2016/17)	N/A	(1,711)	N/A	2.43%
+ 1% Rate Increase in 2016	31	116	206	-0.26%
- 1% Rate Increase in 2016	(31)	(115)	(200)	0.26%
Capital Down $50 M MH	7	85	206	-0.26%
Capital Up $50 M MH	(7)	(85)	(205)	0.26%

Note: Appendix 3.2, Table 16-2 page 22 reflects consolidated results for the ±1%iInterest sensitivities, including gas operations.

The projected electric operations financial statements supporting each of the sensitivity analysis above are attached.

MANITOBA HYDRO
DEBT MANAGEMENT STRATEGY

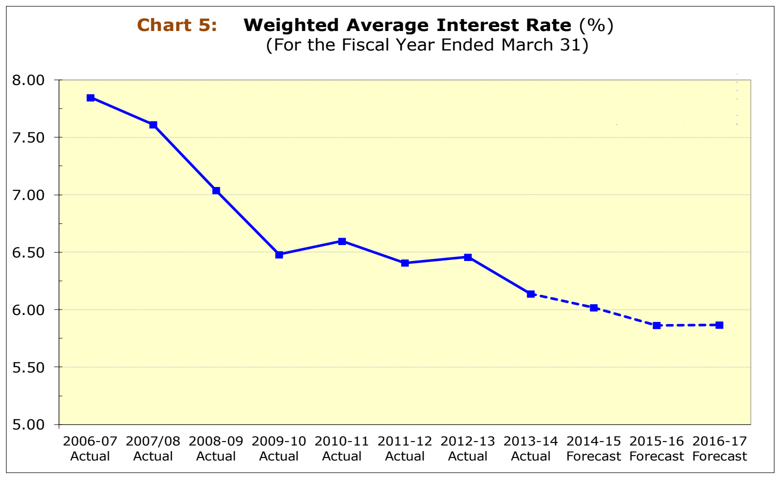
2014/15, 2015/16 AND 2016/17

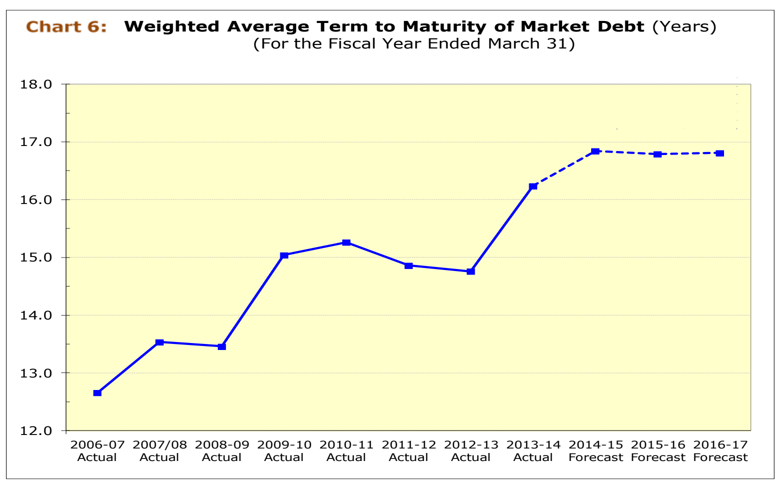
Manitoba Hydro's fundamental debt management objective is to provide **stable, low cost funding** to meet the financial obligations and liquidity needs of the Corporation.

The low interest rate environment over the past few years has provided the opportunity for Manitoba Hydro to secure stable, low cost funding.

Since 2006/07, the debt portfolio's net weighted average interest rate has decreased by nearly 2.0%. To enhance the debt portfolio stability, the weighted average term to maturity of its market debt portfolio has increased by over three years.

In order to mitigate refinancing risk, to maintain financing flexibility during the upcoming decade, and in keeping with the concept of matching the Corporation's long-lived assets with long term debt, Manitoba Hydro will continue to favour long term fixed rate financings with maturities of 10 years and longer.





Manitoba Hydro

Table of Contents

1.0 Purpose of this Document

The *Debt Management Strategy* document provides information on the historical growth of the Corporation's investment in fixed assets and the corresponding increase in Manitoba Hydro's long term debt. The document also summarizes the statutes that govern the Corporation's financing programs, and outlines the debt management strategies that will address the Corporation's financing requirements for the 2014/15, 2015/16 and 2016/17 fiscal years.

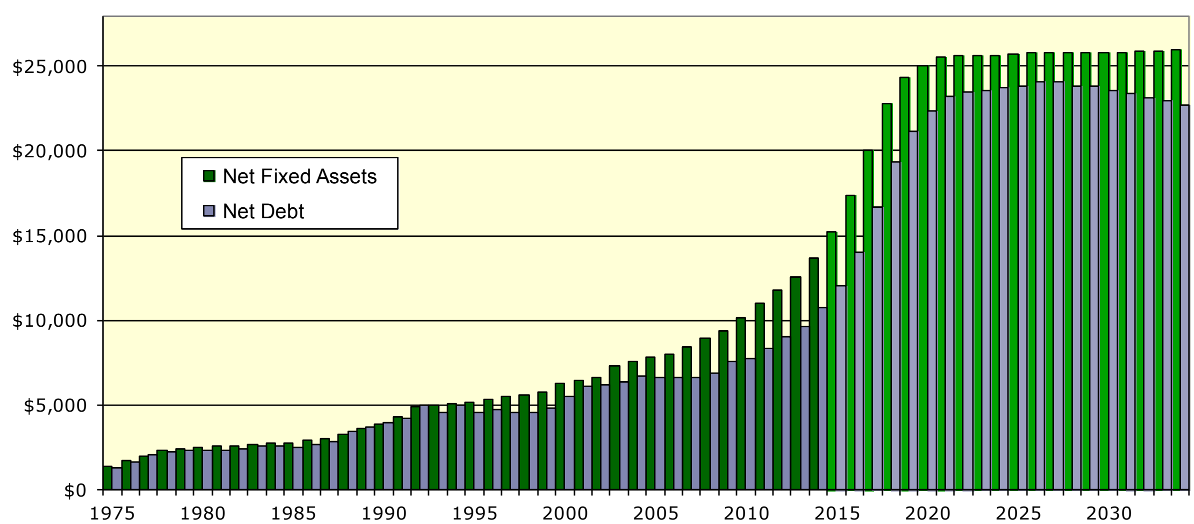
2.0 Overview of Manitoba Hydro's Capital Financing Program

As with most energy utilities, debt is an essential component of Manitoba Hydro's corporate capital structure. As a Crown Corporation owned by the Province of Manitoba, Manitoba Hydro does not have access to share capital as a source of funds. Therefore, in order to adequately provide for the long term energy requirements of the province, Manitoba Hydro must rely on debt as its primary source of external financing.

Debt financing has been beneficial for Manitoba Hydro and its ratepayers. It has fueled the growth of the Corporation from the early days of farm electrification and the development of the Winnipeg River generation system, through the years of development of the Nelson River generation and transmission system, right up to the recent construction of the Wuskwatim Generating station in northern Manitoba. None of this would have been possible without debt financing.

Chart 1 illustrates the growth in net fixed assets and net long term debt since 1975. While net debt has grown to approximately $10.8 billion as at March 31, 2014, the corresponding investment in generation, transmission, distribution and other assets has grown at a much greater pace to a net book value of approximately $13.6 billion at March 31, 2014. Moving forward, both the level of net fixed assets and net debt are forecasted to grow until the 2020s before the projected level of net debt begins to decline after 2025.

Chart 1: **Manitoba Hydro**
Net Fixed Assets & Net Debt
(Actuals to March 31, 2014 in millions of dollars at fiscal year ending)



The *Capital Expenditure Forecast* (CEF14) is a projection of Manitoba Hydro's capital expenditures for new and replacement facilities to meet the electricity and natural gas service requirements in the Province of Manitoba, as well as expenditures required to meet firm sale commitments outside the province. The CEF14 totals $17.8 billion for the ten year period from 2014/15 to 2023/24. Expenditures for Major New Generation & Transmission total $11.7 billion, with the balance of $6.1 billion comprised of expenditures for infrastructure renewal, system safety and security, new and increasing load requirements, and ongoing efficiency improvements.

While debt financing provides the majority of funding necessary for investment in long term assets, Manitoba Hydro also funds a significant portion of its capital requirements from cash generated from operations. Utilizing funds from operations reduces the amount that would otherwise need to be borrowed each year by the Corporation. The net cash flow from operations for the next 10 years is forecast to be nearly $6.2 billion, with an average during this timeframe of nearly $620 million per fiscal year.

3.0 Borrowing Authority of Manitoba Hydro

Manitoba Hydro's authority to issue debt is provided through The Manitoba Hydro Act, The Loan Act, and The Financial Administration Act. The following sections provide a synopsis of the authority received by Manitoba Hydro through this legislation.

3.1 The Manitoba Hydro Act

The Manitoba Hydro Act grants the following powers to the Corporation for issuing debt in the name of the Manitoba Hydro-Electric Board:

1. **Temporary Borrowing Authority**
   The principal amount of short term promissory notes outstanding at any one time shall not exceed in the aggregate the sum of $500 million of principal outstanding at any one time, upon such terms, for such periods, and upon such other conditions, as the Corporation may determine.

2. **Government Guarantee**
   The Government may, on such terms as may be approved by the Lieutenant Governor in Council, guarantee the payment of the principal and interest on any borrowings of the Corporation under this section.

3. **Power of the Corporation to Borrow and Issue Securities**
   The Corporation may raise money by way of loan, notes, bonds, debentures or other securities in the name of The Manitoba Hydro-Electric Board subject to the approval of the Lieutenant Governor in Council for purposes provided in the Manitoba Hydro Act or to refund any loan or advance previously made by the Corporation.

   Borrowing authority, under Section 35 of the Manitoba Hydro Act, will treat Canadian and US borrowings on a one for one par value basis. The borrowing authority will be abated for the Canadian dollar equivalent using the nominal rate of exchange when the loan is denominated in a currency other than Canadian or US dollars.

3.2 The Loan Act

The Loan Act is approved each year and grants Manitoba Hydro borrowing authority to meet the Corporation's projected financing requirements. Authority granted under the Loan Act is for purposes other than to refinance debt, including new investment requirements. Refunding authority to refinance maturing long term debt is provided through the Financial Administration Act.

3.3 The Financial Administration Act

The Financial Administration Act authorizes the Minister of Finance to borrow money for any purpose authorized by any Act of the Legislature or for the payment, refunding, refinancing or renewal, from time to time, of the whole or any part of any loan made or provincial securities issued under any Act.

4.0 Debt Management Objectives

Manitoba Hydro's fundamental *debt management objective is to provide stable, low cost funding to meet the financial obligations and liquidity needs of the Corporation*. Manitoba Hydro continually monitors the interest rate environment and acts to secure stable, low cost financing with terms to maturity that fit the Corporation's debt maturity schedule and meet investor appetite.

Manitoba Hydro's debt is viewed to be self-supporting by credit rating agencies (Dominion Bond Rating Service, Moody's Investors Service, and Standard & Poor's). In order to maintain the self-supporting nature of the Corporation's debt obligations and the attractive financing rates associated with the Corporation's debt, Manitoba Hydro places significant emphasis on the following financial targets:

Debt/Equity – Maintain a minimum debt/equity ratio of 75:25. The debt to equity ratio indicates the relative percentage of assets financed through debt versus equity. It is calculated by dividing debt by debt plus equity.

Interest Coverage – Maintain an annual gross interest coverage ratio greater than 1.20. The interest coverage ratio indicates the extent to which net income is sufficient to pay gross interest on debt. It is calculated by dividing net income plus gross interest on debt by gross interest on debt.

Capital Coverage – Maintain a capital coverage ratio of greater than 1.20. The capital coverage ratio indicates the extent to which cash generated internally is sufficient to fund capital construction expenditures without additional external financing. It is calculated by dividing cash generated from operations by capital construction expenditures (excluding major new generation & transmission projects).

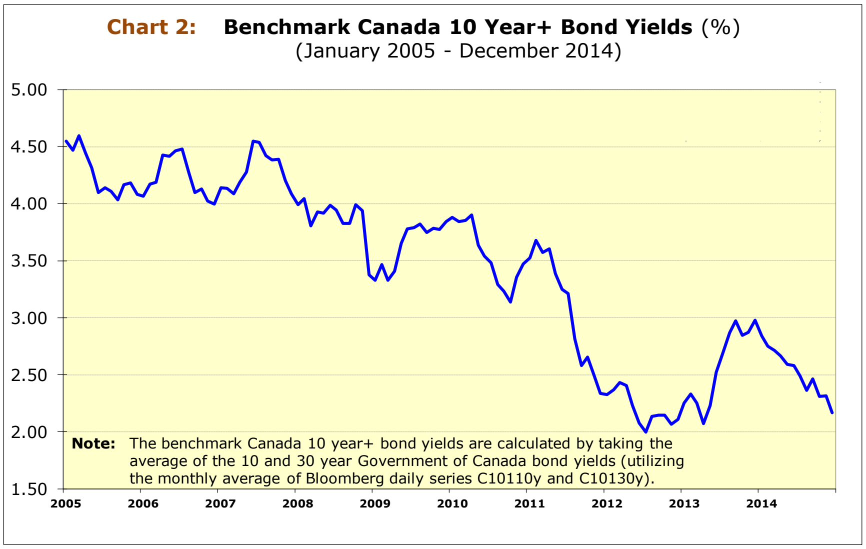
Note: Financial targets may not be achieved during years of major investment in the generation and transmission system.

5.0 Analysis and Commentary

> "Unexpectedly slow global recovery has meant that monetary conditions in advanced economies, including Canada, have been very stimulative for much longer than envisioned in the aftermath of the financial crisis."
>
> Bank of Canada, *Financial System Review*, December 2014, page 5.

While short term interest rates remain artificially anchored at their extraordinary low levels by central bank monetary policy interventions, long term interest rates began to rise in May 2013 as the financial markets anticipated the potential tapering of the U.S. Federal Reserve's quantitative easing program in the latter part of 2013. Since early 2014, yields in the long end have once again trended downward with the uncertainty regarding the pace of the U.S. economic recovery, the re-emergence of geopolitical issues, global growth concerns and falling oil prices.

The long term interest rates in the Canadian capital markets showed a similar trajectory. As shown on historical interest rate chart for the **Benchmark Canada 10 Year+ bond yields** (Chart 1), while the interest rates in the 12 month period prior to May 2013 were generally range bound at historically low levels, by September 2013 interest rates rose nearly 1%. Since then, long term interest rates have drifted downward, once again approaching historically low levels.



The **credit spreads** between the benchmark long term Government of Canada bonds and the all-in cost to the Province of Manitoba have tightened since May 2013 (Chart 3). The net impact of these movements is that Manitoba Hydro's current interest rate environment continues to be low in comparison to historical rates across the entire spectrum of the yield curve. This situation is demonstrated on the interest rate chart on page 7 that depicts historical interest rates dating back to January 1948, as well as a range of externally forecasted interest rates to 2034 (Chart 4).

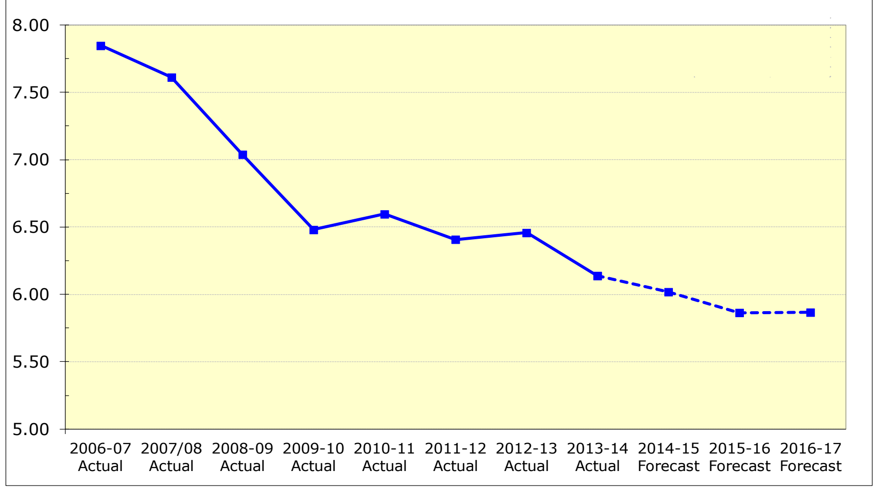
Chart 4 illustrates that for a prolonged period of time from the mid-1970's to the early 1990's, the long term interest rates for the Province of Manitoba were in excess of 10%, and in 1981 the long term interest rate exceeded 18%. The average 10 year+ interest rate in the April 1992 – July 2007 period before the financial crisis was slightly over 6.5%, while in the post-financial crisis period from August 2007 to December 2014 the average 10 year+ interest rate was slightly below 4.0%. Looking forward, the average 10 year+ interest rates are forecast to rise from their actual at December 31, 2014 of approximately 3.0% to the average consensus forecast of approximately 5.2% by 2019/20.

With respect to the interest rate environment for Manitoba Hydro's Canadian long term floating rate debt, historically there has been significant volatility in interest reset rates.[1] As compared to the 10 year+ interest rates, the average 3 month Canadian T-Bill interest rate (as a proxy for both the variable interest reset rates on Manitoba Hydro's portfolio of Canadian long term floating rate debt and Manitoba Hydro's short term interest rate) have had higher peaks and lower valleys, along with more intervening variability. Looking forward, by 2019/20 average consensus forecast for the 3 month T-Bill rate is projected to be approximately 3.9%.

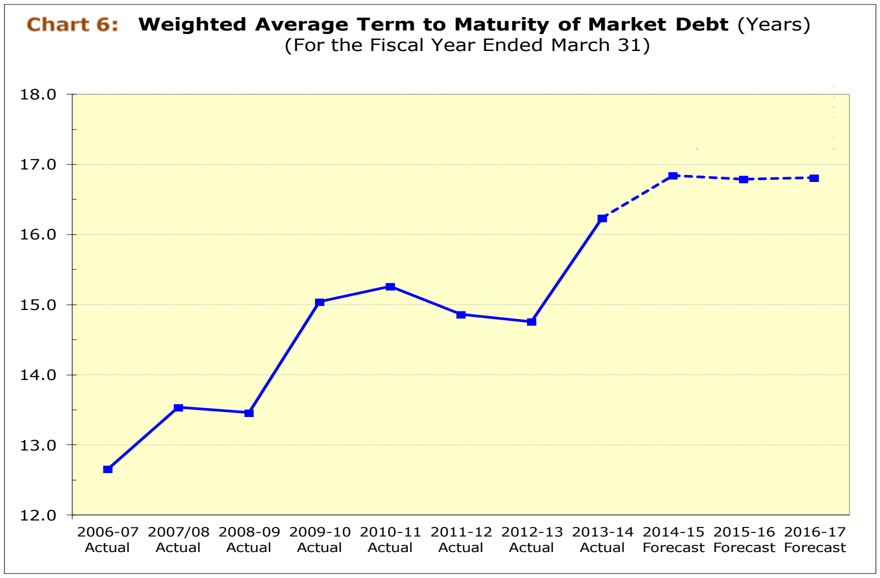
Although economic forecasts during the last few years have generally called for a quicker economic recovery and correspondingly higher interest rates, on an actual basis, the strength and pace of a recovery has been subdued. Manitoba Hydro will continue to monitor the financial markets, along with gathering the views of external economic forecasters in order to obtain the range and consensus forecast of their opinions.

The low interest rate environment over the past few years has provided the opportunity for Manitoba Hydro to secure stable, low cost funding. As shown on Chart 5, since 2006/07, the debt portfolio's **net weighted average interest rate has decreased** by nearly 2.0%. It is anticipated that this positive trend will continue until leveling off in 2016/17.

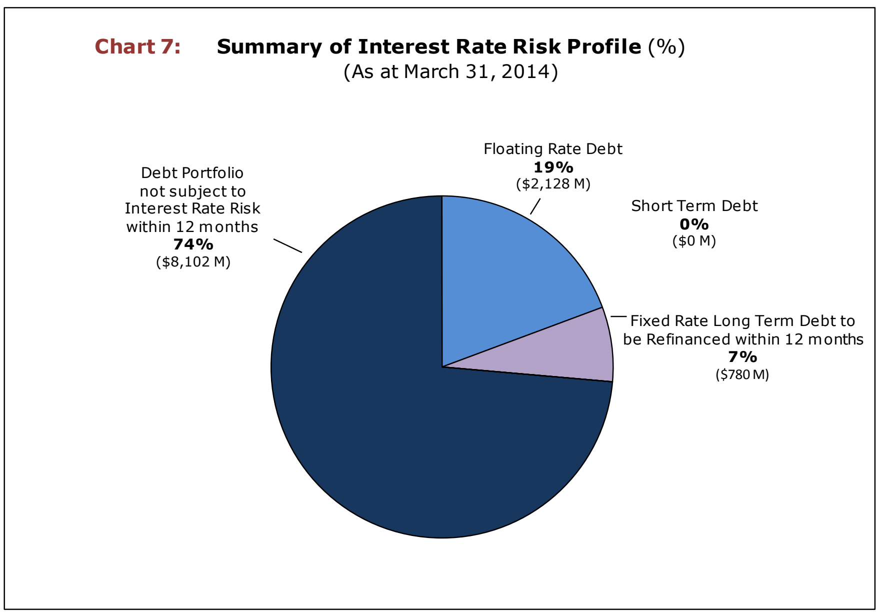
Chart 5: Weighted Average Interest Rate (%)
(For the Fiscal Year Ended March 31)



[1] The interest reset rate for Manitoba Hydro's portfolio of Canadian long term floating rate debt is typically the 3 month Bloomberg Bankers' Acceptance rate (CDOR03). The pricing for these long term floating rate debt issues also have a fixed rate margin that is added to the variable bankers' acceptance (BA) component. For example, on March 31, 2011 Manitoba Hydro secured long term debt series C121-3 for CAD $100 million and an April 19, 2016 maturity date. C121-3 bears a floating coupon rate of CDOR03 + 20 basis points. The coupon payment rate is reset on a quarterly basis to add the variable BA component to the 20 basis point fixed rate margin.



This opportunity to secure low cost financing is balanced alongside the debt management objective to provide stability. To enhance the debt portfolio stability, the **weighted average term to maturity of its market debt portfolio has increased** by over three years since 2006/07 (Chart 6). When selecting terms for its new borrowings, Manitoba Hydro gives careful consideration to the debt maturity schedule and the total level of annual financing requirements. In order to mitigate refinancing risk, to maintain financing flexibility during the upcoming decade, and in keeping with the concept of matching the Corporation's long-lived assets with long term debt, Manitoba Hydro will continue to favour long term fixed rate financings with maturities of 10 years and longer. For Manitoba Hydro's new long term debt issuance in 2013/14, the term to maturity ranged from 3 – 50 years, with a weighted average term to maturity of 28 years.



Stability is also reinforced by carefully managing the aggregate interest rate risk within the debt portfolio. Manitoba Hydro's **interest rate policy** on its existing debt portfolio is to limit the aggregate of: i) floating rate debt, ii) short term debt, and iii) fixed rate long term debt to be refinanced within the subsequent 12 month period; to a maximum of 35% of the total debt portfolio. Manitoba Hydro's interest rate risk guidelines for its existing debt portfolio include maintaining an aggregate of floating rate debt and short term debt within 15 – 25% of the total debt portfolio, and having the fixed rate long term debt to be refinanced within a 12 month period being less than 15% of the total debt portfolio. During years in which there are high levels of refinancings and/or new borrowings for prospective cash requirements, in order to manage the overall interest rate risk profile, the Corporation's interest rate risk on its existing debt portfolio may be reduced by decreasing the percentage of aggregated floating rate debt and short term debt to below 15% of the total debt portfolio. A graphical depiction of Manitoba Hydro's interest rate risk profile as at March 31, 2014 is as shown in Chart 7. During 2014/15, the interest rate risk on the existing debt portfolio will be reduced in order to accommodate the significant prospective capital borrowing requirements during 2015/16 and 2016/17. Consequenty, it is projected that the percentage of floating rate debt within the projected debt portfolio at March 31, 2015 will be approximately 15%.

Liquidity risk refers to the risk that Manitoba Hydro will not have sufficient cash or cash equivalents to meet its financial obligations as they come due. Manitoba Hydro will meet its financial obligations when due through cash generated from operations, short term borrowings, long term borrowings advanced from the Province of Manitoba, and where applicable, sinking fund withdrawals. Overall financing requirements of Manitoba Hydro and its subsidiaries are managed on a consolidated basis. The Corporation closely monitors its cash receipts and disbursements on a daily basis as part of regular cash balancing activities. The Corporation also monitors short term debt balances and forecasted cash requirements to ensure that it has sufficient cash to meet near term financial obligations as they come due. To support business continuity and enhance financing flexibility, the Corporation may maintain positive cash and/or investment balances.

The Manitoba Hydro Act grants the Corporation the power to issue short term borrowings in the name of the Manitoba Hydro-Electric Board up to a limit of $500 million and to have this debt unconditionally guaranteed as to principal and interest by the Province of Manitoba. Short term borrowings are considered to have terms to maturity of less than one year. The short term borrowing program is a credit facility with a primary objective to safeguard the Corporation from liquidity risk by providing sufficient liquidity for the Corporation's temporary cash requirements. Manitoba Hydro uses its short term debt line to fund its working capital requirements and to bridge the timing between long term debt issues. As Manitoba Hydro can issue promissory notes payable within its Commercial Paper Program at rates lower than the Prime or Base Rates, Manitoba Hydro typically issues promissory notes instead of relying on bank overdrafts to meet its temporary cash requirements.

Manitoba Hydro is legislated under the Manitoba Hydro Act to make sinking fund payments to the Province of Manitoba of not less than 1% of the principal amount of the outstanding debt on the preceding March 31, and 4% of the balance in the sinking fund at such date. Sinking funds are invested in highly rated government or corporate bonds, as well as money market instruments. Sinking fund withdrawals are applied towards the repayment of advances made to, and moneys borrowed by, the Corporation.

Manitoba Hydro has significant export revenues denominated in US dollars. As part of the Corporation's **foreign currency exchange risk management program**, in order to mitigate the foreign currency exchange risk on these revenues, Manitoba Hydro maintains a natural hedge with US dollar cash flows, including outflows from US denominated debt. At December 31, 2014 the portion of Manitoba Hydro's debt portfolio that was made up of US denominated debt principal was 13%. The US debt portfolio may occasionally be rebalanced in accordance with US dollar cash flows. In addition to the mitigation of foreign exchange risk, Manitoba Hydro considers a number of factors when determining whether it will seek US dollar versus Canadian dollar debt, including the cost effectiveness of executing a US dollar versus a Canadian dollar issuance for available terms, and the liquidity and interest rate benefits associated with broadened access to capital within a diversified investor base. Although provincial borrowers frequently issue long bonds in the Canadian capital markets, due to financial market conditions, provincial issuance of US dollar debt with terms greater than 10 years is unusual because the long end of the US curve has not been cost effective compared to Canada for many years.

6.0 Debt Management Activities

The following section provides an overview of Manitoba Hydro's recent actual financings, as well as the forecasted financing requirements for 2014/15, 2015/16 and 2016/17. Actual financings will vary from forecast. Actual financings will consider the timing, dollar value, denomination, and fixed versus floating nature of the issue depending on a number of factors including: the cash and liquidity requirements in existence at the time of financing; refinancing requirements on maturing debt and interest rate swaps; the term dependent on the current maturity schedule and forecasted borrowing requirements; interest rate expectations and the mitigation of interest rate risk; the management of foreign exchange risk; and the market appetite and economic environment.

2014/15 The actual and forecasted long term debt financings were as follows:

Quarter 1 During the first quarter, Manitoba Hydro secured long term debt financing totaling $856 million; of which $475 million was issued to finance new cash requirements and $381 million was for the refinancing of debt series FS-2A, FS-2B, FS-2C and FS-2D. A $100 million USD sinking fund withdrawal for the retirement of FS-1 on April 28, 2014 was also executed during this quarter.

Quarter 2 During the second quarter, Manitoba Hydro secured long term debt financing totaling $726.6 million; of which $387.4 million was issued to finance new cash requirements, $89.2 million was to fund HydroBond redemptions, and $250.0 million was for the refinancing of debt series FM-1, FM-2, FM-3 and FM-4.

Quarter 3 During the third quarter, Manitoba Hydro secured long term debt financing totaling $490 million; of which $200 million was for the refinancing of debt series FC-3, $40 million was for the refinancing of mitigation bond 5A, and $250 million was issued to finance new cash requirements. A currency swap to repatriate $200 million of USD principal into $228.38 million of CAD principal was also executed during this quarter for debt series EE.

Quarter 4 It is forecasted that $400 million of long term debt will be issued during this quarter for new cash requirements.

2015/16 The forecasted long term debt financing requirement is $2,400 million composed of the following:

- $2,088 million of long term debt for new cash requirements.
- $312 million to refinance maturing long term debt.

Manitoba Hydro will consider the availability of sinking fund withdrawals to reduce the required refinancing of maturing debt.

The long term debt financings forecasted for each quarter of this fiscal year are as follows:

Quarter 1 It is forecasted that $538 million of long term debt will be issued during this quarter for new cash requirements. In addition, the following refinancings are forecasted to occur in this quarter: a $50 million refinancing of floating rate debt issue C115 maturing May 4, 2015 and a $12 million refinancing of Winnipeg Hydro Bond 4K maturing May 12, 2015.

Quarter 2 It is forecasted that $600 million of long term debt will be issued during this quarter for new cash requirements.

Quarter 3 It is forecasted that $550 million of long term debt will be issued during this quarter for new cash requirements. In addition, the following floating rate debt refinancings are forecasted to occur this quarter: a $50 million refinancing of EY2 and a $200 refinancing of EY both maturing December 3, 2015.

Quarter 4 It is forecasted that $400 million of long term debt will be issued during this quarter for new cash requirements.

2016/17 The forecasted long term debt financing requirement is $3,200 million composed of the following:

- $2,866 million of long term debt for new cash requirements.
- $334 million to refinance maturing long term debt.

Manitoba Hydro will consider the availability of sinking fund withdrawals to reduce the required refinancing of maturing debt.

The long term debt financings forecasted for each quarter of this fiscal year are as follows:

Quarter 1 It is forecasted that $867 million of long term debt will be issued during this quarter for new cash requirements. In addition, the following refinancings are forecasted to occur in this quarter: a $100 million refinancing of floating rate debt issue C121-3 maturing April 19, 2016 and a $33 million refinancing of Hydrobonds maturing June 15, 2016.

Quarter 2 It is forecasted that $799.4 million of long term debt will be issued during this quarter for new cash requirements. In addition, the following refinancing is forecasted to occur in this quarter: a $200.6 million refinancing of floating rate debt issue AZ maturing July 17, 2016.

Quarter 3 It is forecasted that $400 million of long term debt will be issued during this quarter for new cash requirements.

Quarter 4 It is forecasted that $800 million of long term debt will be issued during this quarter for new cash requirements.

Short-Term Debt*	R-1 (middle)	Confirmed	Stable

*Issued/guaranteed by the Province, including the Manitoba-Hydro Electric Board.

Rating Update

DBRS has confirmed the Issuer Rating and Long-Term Debt ratings of the Province of Manitoba (the Province or Manitoba) at A (high), along with its Short-Term Debt rating at R-1 (middle). The trend on all ratings is Stable. Improvement in fiscal performance has been slow, although Manitoba remains on track to restore balance by 2016–17, as presented last year. While debt has increased notably from pre-recession levels, it now appears to be stabilizing, aided by supportive economic conditions and stronger external demand.

For the fiscal year ended March 31, 2014, Manitoba reported a deficit of $522 million in its recently released public accounts. On a DBRS-adjusted basis, after including capital expenditures as incurred rather than as amortized, this translates into a shortfall of $1.3 billion, or 2.2% of GDP, compared with a deficit of $1.6 billion anticipated at the time of DBRS's last review. The better-than-expected performance was entirely due to lower-than-planned capital spending, while revenues rose by 4.5%, consistent with budget. As a result, total DBRS-adjusted debt grew by 7.2% to $23.1 billion, pushing the debt-to-GDP ratio to 38.2% from 36.9% a year earlier. This represents the fourth-highest debt burden among Canadian provinces. (Continued on page 2.)

Rating Considerations

Strengths
(1) Diversified and resilient economy
(2) Manageable debt burden and sound debt management practices
(3) Abundant low-cost hydroelectricity

Challenges
(1) Slow fiscal progress dependent on successful renewal of public sector collective agreements
(2) High reliance on federal transfers
(3) Below-average income and GDP per capita

Province of Manitoba

Report Date:
October 17, 2014

Rating Update (Continued from page 1.)

Based on the current private sector consensus tracked by DBRS, real GDP is forecast to grow by 1.9% in 2014, which compares with the 2.2% assumed by Manitoba at budget time. However, for 2015, the private sector consensus looks somewhat stronger, pointing to real growth of 2.4%. A return to normal crop production will exert a modest drag on growth in 2014, but this is expected to subside the following year. In addition, investment activity is poised to regain some momentum heading into 2015, and an improving outlook for U.S. demand and a weaker Canadian dollar should be positive for exports and help to offset a soft domestic environment.

After experiencing a delay last year, Manitoba's target to restore fiscal balance by 2016–17 remains intact in the current budget. For 2014–15, a deficit of $357 million is projected, or $1.3 billion on a DBRS-adjusted basis. This equates to 2.1% of GDP – still one of the largest fiscal shortfalls among Canadian provinces. Aside from targeted tax credits for seniors and one to promote increased apprenticeship opportunities, this year's budget was devoid of any significant tax measures. Meanwhile, total spending is forecast to advance by 2.9% but will require sound fiscal discipline to help achieve targets. This includes limiting the growth in health-care spending to just 1.5% − an ambitious target. In this regard, the government has introduced a new lean council intended to enhance service delivery and workflow, although there are no specific savings targets associated with this initiative. Moreover, labour negotiations will be particularly important, with a number of collective agreements coming up for renewal. As a result, the debt-to-GDP ratio will continue to inch up to 38.6% in 2014–15 before stabilizing around 39% thereafter. This represents a slight improvement from the peak foreseen at the time of DBRS's last review and is considered manageable for the rating.

Rating Considerations Details

Strengths

(1) Manitoba has one of the most resilient and well-diversified economies in the country. This strength was evident during the 2009 downturn when the Province experienced only a very mild recession. The economy boasts a well-balanced mix of industries, including agriculture and mining, manufacturing, financial services and transportation and has one of the lowest unemployment rates in Canada. In addition, the composition of Manitoba's exports also tends to be more diverse than that of other provinces. As a result of these factors, the provincial economy shows less volatility than its manufacturing- and resource-dependent neighbours.

(2) As of March 31, 2014, Manitoba's debt burden stood at 38.2% of GDP, and, although it has been creeping up since 2009, it is comparable to levels seen in the late 1990s and remains manageable for the current ratings. The Province maintains a relatively smooth debt maturity profile, with no unhedged foreign currency debt (excluding Manitoba Hydro) and a moderate level of floating-rate debt, which adds stability to debt-servicing requirements.

(3) Manitoba benefits from an abundance of low-cost hydroelectricity, resulting in some of the lowest electricity rates in North America. This gives the Province a distinct advantage when competing for new business investment. The 214 megawatt (MW) Wuskwatim dam project was completed in 2012, further adding to Manitoba's supply of hydroelectricity. In addition, the Keeyask generating station (695 MW for $6.5 billion) is moving forward with an anticipated in-service date of 2019, and Conawapa (1,485 for $10.7 billion) is also being considered but will be dependent on growth in domestic demand and Manitoba Hydro's ability to secure export contracts. DBRS notes that the relatively recent expansion of shale gas extraction has altered the competitive landscape by increasing the supply of low cost energy and may slow Manitoba's appetite for further development.

Challenges

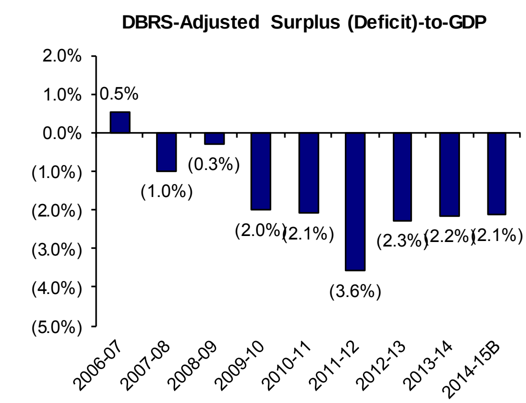
(1) With a return to balance not anticipated until 2016–17, Manitoba's fiscal recovery plan is one of the slowest recovery plans among Canadian provinces even though the depth of the recession was relatively mild. On a DBRS-adjusted basis, Manitoba's deficit has been equal to 2.0% of GDP or greater for five consecutive years, and this is expected to continue in 2014–15. Furthermore, adherence to fiscal targets will be dependent on the

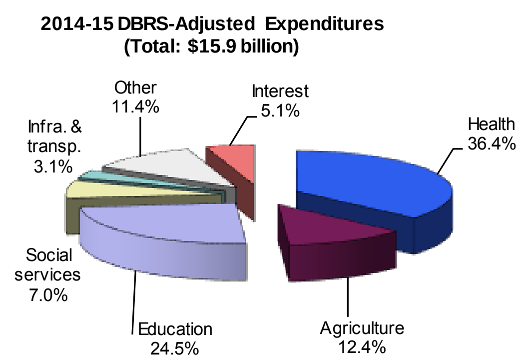
successful renewal of a number of collective agreements, including those with teachers and civil servants, which may be challenging in an environment of improving economic conditions.

(2) Despite its relatively resilient economy, Manitoba receives approximately 27% of its revenues by way of federal transfers, including roughly 13% from equalization, leaving it exposed to changes in federal transfer programs. This represents the highest reliance on federal revenues outside of Atlantic Canada.

(3) Manitoba boasts a well-diversified economy and healthy labour market; however, it continues to exhibit below-average wealth. The Province recorded primary household income per capita of $30,417 in 2012 (the latest year for which information is available), below the national average of $34,210. Manitoba also generates below-average GDP per capita, suggesting that productivity and high-value-added sectors may be lagging.

2014-15 Budget





After experiencing a delay last year, Manitoba's target to restore fiscal balance by 2016–17 remains intact in the current budget. For 2014–15, a deficit of $357 million is projected, or $1.3 billion on a DBRS-adjusted basis (after including capital expenditures as incurred rather than as amortized). This is consistent with the deficit realized in 2013–14 and equates to 2.1% of GDP – still one of the largest fiscal shortfalls among Canadian provinces.

For 2014–15, the Province's revenue forecast is based on nominal GDP growth of 3.5%, which is expected to contribute to a 2.9% increase in total DBRS-adjusted revenues. Aside from targeted tax credits for seniors and one to promote increased apprenticeship opportunities, this year's budget was devoid of any significant tax measures. Nonetheless, tax revenues are projected to rise by close to 10.0% year over year, buoyed by an 8.8% increase in sales tax receipts, reflecting the full-year impact of the 1% rate adjustment – to 8% − implemented last year. Personal and corporate income taxes are also forecast to rise by 4.2% and 7.1%, respectively. However, reduced earnings at government business enterprises and a modest decline in federal transfers will provide a partial offset.

Similar to revenues, DBRS-adjusted total spending is forecast to advance by 2.9% but will require sound fiscal discipline to help achieve targets. In this regard, the government has introduced a new lean council intended to enhance service delivery and workflow, although there are no specific savings targets associated with this initiative. Labour negotiations will be particularly important, as a number of collective agreements are due to be renegotiated, including those with teachers and civil servants. Of note, the government continues to reduce the size of the civil service and is over halfway toward its target of a reduction in 600 (headcount). Of the key program areas, education will see the largest increase, rising by 9.4%, as the Province continues to target smaller class sizes. Meanwhile, health and social services will be limited to 1.5% and 3.8% growth, respectively. To contain health care costs, the Province is continuing with efforts to amalgamate the regional health authorities, better coordinate primary care and, where possible, move to generic drugs.

Nonetheless, an aging and growing population and general increases in demand for services is going to make achieving this target a challenging task. Most other program areas will see relatively flat or declining budget allocations. Gross capital spending is projected to rise by 16.5%, although DBRS notes that this is an area that is often underspent. Interest charges, net of sinking fund earnings, are projected to rise by 5.8%, reflective of Manitoba's growing debt burden, but DBRS notes that the currently low interest rate environment is likely to result in some savings in this area.

Outlook

First quarter results released on September 30, 2014, indicate that fiscal performance is tracking slightly ahead of plan. Stronger performance at government business enterprises has helped to boost revenues by $41 million, while underspending of $46 million is largely attributed to timing. However, DBRS notes that subsequent to the first quarter, the Province authorized $100 million in additional spending related to summer floods not yet incorporated in the above results. While mitigation efforts are being sought, this highlights the still challenging task of restoring fiscal balance.

Manitoba's medium-term fiscal outlook forecasts a deficit of $218 million in 2015–16, followed by small surpluses in both 2016–17 and 2017–18. On a DBRS-adjusted basis, deficits are expected to range between 1.0% and 1.8% of GDP over the forecast horizon but will require prudent fiscal discipline and a supportive economic backdrop if these targets are to be achieved.

2013–14 Results

For the fiscal year ended March 31, 2014, public accounts reported a deficit of $522 million. On a DBRS-adjusted basis, this translates into a shortfall of $1.3 billion, or 2.2% of GDP, compared with a deficit of $1.6 billion anticipated at the time of DBRS's last review. The better-than-expected performance was entirely due to lower-than-planned capital spending.

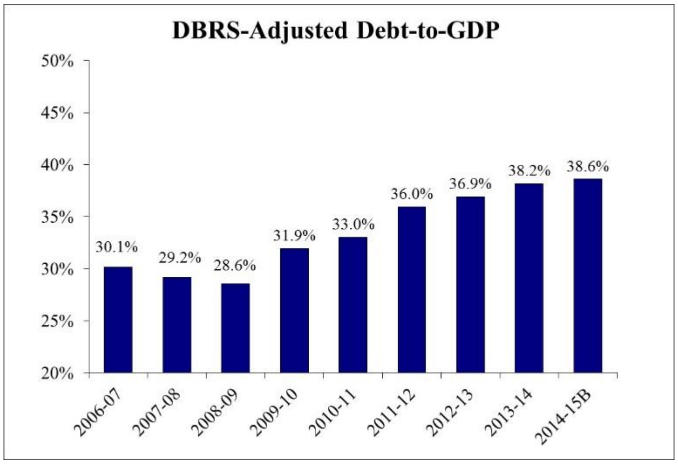
In 2013–14, total DBRS-adjusted revenues grew by 4.5% year over year, in line with budget. An increase in sales tax receipts was the primary driver as a result of last year's decision to raise the provincial rate to 8% from 7%, which took effect in July 2013. This boosted sales taxes by 14.8% from 2012–13. Corporate income tax was up by 6.0%, largely owing to favourable prior year adjustments. Results were also strong at Manitoba Hydro, as it reported its highest net income since 2008–09, owing to increased demand and prices during a cold winter. Federal transfers were an area of weakness, as they declined by 2.8% year over year as a result of a combination of lower equalization payments and other cost shared programs.

DBRS-adjusted spending growth was limited to 4.0% in 2013–14, helped by gross capital spending that came in $332 million below budget. Health-care costs advanced by 4.6%, driven by inflationary pressures at the regional health authorities. Meanwhile, education costs grew by 6.7%, partly driven by the government's initiative to fund smaller class sizes and also higher pension costs as a result of required increases in employer contributions. Volume and price pressures contributed to increases in social services by 3.8%. During the year, the Province also set aside $100 million in provisions for a flood settlement with First Nations communities related to long-standing claims.

Province of Manitoba

Report Date:
October 17, 2014

Debt Profile



In 2013–14, total DBRS-adjusted debt (defined as tax-supported debt plus unfunded pension liabilities) grew by 7.2% to \$23.0 billion. This was somewhat faster than expected, driven by increased debt at crown corporations and municipalities as well as faster growth in unfunded pension liabilities that were only partly offset by lower-than-planned capital spending. As a result, this boosted the debt-to-GDP ratio to 38.2% from 36.9% a year earlier and represents the fourth-highest debt burden among Canadian provinces.

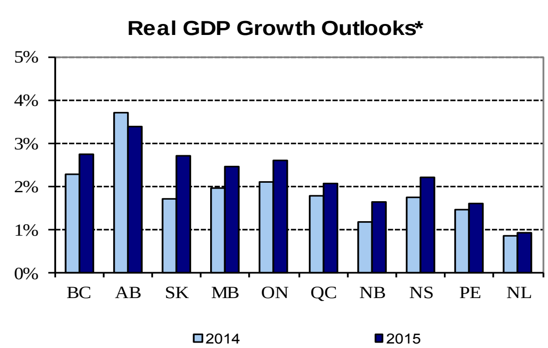
Manitoba boasts sound debt management practices with a relatively smooth debt maturity profile. As of March 31, 2104, the Province had no unhedged foreign currency debt (aside from Manitoba Hydro) and floating-rate debt comprised only 15% of total debt. This adds stability to borrowing costs, which accounted for only 5.4% of total revenues in 2013–14.

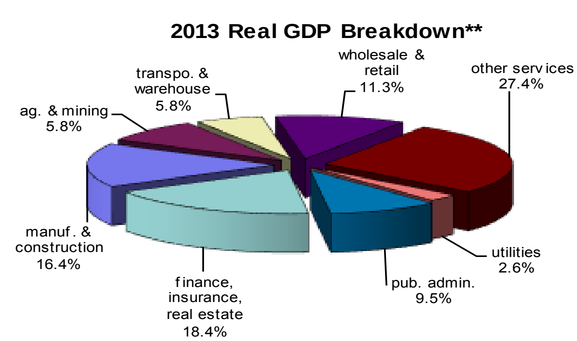
Outlook

For 2014–15, debt is expected to grow by a further \$1.1 billion, or 4.7%, driven by the fiscal deficit and capital spending in excess of amortization. As such, debt-to-GDP will continue to inch up to 38.6%. Gross borrowing requirements are forecast at \$4.8 billion and comprise \$2.4 billion in refinancing needs, \$842 million for fiscal shortfall and capital needs, and the remainder for crown corporations, largely Manitoba Hydro. At the time of writing, approximately \$3.3 billion, or 70%, of borrowing needs had been fulfilled.

Based on the Province's medium-term plan, debt is expected to continue growing between 3% and 6% annually until 2017–18. This should result in Manitoba's debt burden stabilizing around 39% of GDP, a slight improvement from the peak foreseen at the time of DBRS's last review and considered manageable for the rating.

Economy





*Based on major Canadian banks' forecasts at the time of this report. **Statistics Canada, CANSIM379-0028.

Manitoba's economy continued to outperform the national average in 2013, with real GDP advancing by 2.4%. A strong agricultural sector was a key contributor, owing to favourable weather conditions and a bumper crop. In addition, increased activity in the oil sector helped to offset declines in base metal production, while electricity generation showed improvement aided by a full year of production from the new Wuskwatim generating facility. According to Statistics Canada's survey of private and public investment intentions (PPI survey), non-residential construction, machinery and equipment investment was also strong, rising by 8.0% in

2013 – well above the national average. Population growth was relatively sound, supported by international immigration and, when combined with a low interest rate environment, helped to propel housing starts to their highest level since the late 1980s. However, employment growth was somewhat soft, as gains in private sector employment, particularly in agriculture, were mostly offset by reductions in the public sector. Nevertheless, the unemployment rate remained relatively steady at 5.4% – the third lowest among Canadian provinces.

Outlook

Based on the current private sector consensus tracked by DBRS, real GDP is forecast to grow by 1.9% in 2014, which compares with the 2.2% assumed by Manitoba at the time of the budget. The investment climate appears to be somewhat soft, with Statistics Canada's PPI survey pointing to a slight decline in non-residential construction, machinery and equipment spending. Similarly, residential investment is likely to slow, as CMHC forecasts a 14.3% decline in housing starts following a very strong 2013. The outlook for agricultural output appears favourable although unlikely to repeat last year's solid performance. There are also signs that oil production, which has been a major driver of growth in recent years and now accounts for 2.5% of real GDP, may be reaching a plateau absent any significant new discoveries. As of August, Manitoba's unemployment rate stood at 5.5% (seasonally adjusted), up from 5.3% during the same period a year ago and remains above the budget estimate. Retail trade is up by 5.3% (seasonally adjusted) as of July 2014 compared with the prior year, and this is above the national average advance of 5.0%. Encouragingly, export markets are expected to provide an offset to domestic softness, supported by a weaker Canadian dollar and improving U.S. demand.

For 2015, the private sector consensus points to real GDP growth of 2.4%, in line with budget estimates. With a return to normal crop production in 2014, this will no longer be a drag in 2015, and investment is also expected to regain some momentum. Economic risks are considered to be more balanced relative to last year's forecast, providing greater confidence that improving economic conditions will be sustained and supportive of Manitoba's fiscal targets.

The Utility
The Manitoba Hydro-Electric Board (the Utility), a wholly owned Crown corporation of the Province of Manitoba, is a vertically integrated electric utility that provides generation, transmission and distribution of electricity to approximately 555,760 customers throughout Manitoba and natural gas service to approximately 272,228 customers via its subsidiary, Centra Gas Manitoba Inc. The Utility also exports electricity to more than 23 electric utilities through its participation in four wholesale markets in Canada and in the midwestern United States.

Ratings

Debt	Rating	Rating Action	Trend
Long-Term Obligations	A (high)	Confirmed	Stable
Short-Term Obligations	R-1 (middle)	Confirmed	Stable

Note: These Obligations are based on the status of Manitoba Hydro-Electric Board as a Crown agent of Manitoba and the unconditional guarantee provided by the Province on Manitoba Hydro's third-party debt, and thus reflect the Province's debt ratings.

Rating Update

On October 17, 2014, DBRS confirmed the Issuer Rating and Long-Term Debt rating of the Province of Manitoba (the Province) at A (high) and its Short-Term Debt rating at R-1 (middle), all with Stable trends (see DBRS press release, "DBRS Confirms Province of Manitoba at A (high) and R-1 (middle)," dated October 17, 2014). Consequently, the ratings of the Manitoba Hydro-Electric Board (Manitoba Hydro or the Utility) were confirmed, as the ratings of the Utility are a flow-through of the ratings of the Province. Pursuant to *The Manitoba Hydro Act*, the Province unconditionally guarantees almost all of Manitoba Hydro's outstanding third-party debt (see the *DBRS Criteria: Guarantees and Other Forms of Explicit Support* methodology for further details). The Province also provides most of the Utility's financing through provincial advances (approximately 97% of total debt as at March 31, 2014).

Manitoba Hydro is currently undergoing a period of significant capital expenditure (capex) to increase generating capacity and to improve the reliability of its system. On July 2, 2014, the Province released the Public Utilities Board's (PUB) *Report on the Needs For and Alternatives To (NFAT): Review of Manitoba Hydro's Preferred Development Plan*. The NFAT report recommended that the Province and the Utility proceed with the 695 megawatt (MW) Keeyask Infrastructure and Generating Station Projects (Keeyask Project; approximately $6.5 billion) and the Manitoba-Minnesota Transmission Project (approximately $350 million), but stop spending on the 1,485 MW Conawapa Generating Station (approximately $10.7 billion) and the North-South Transmission Upgrade Project (approximately $500 million). The Province accepted these recommendations but also noted that the Conawapa Generating Station may be brought back for independent review in the future if an improved business case with more confirmed export sales can be made.

The large projects at Manitoba Hydro, including the Keeyask Project and the Bipole III Transmission Reliability Project (Bipole III; approximately $4.6 billion), will likely result in negative free cash flows for the Utility over the medium term and require substantial external funding. The Utility is expected to finance any cash shortfalls through advances from the Province. DBRS expects the Utility's key financial ratios to remain relatively flat as expected rate increases should improve cash flow and service debt obligations.

Rating Considerations

Strengths
(1) Debt is a direct obligation of the Province
(2) Low-cost hydro-based generation
(3) Access to favourable export markets

Challenges
(1) Hydrology risk
(2) High leverage
(3) High level of planned capex

Financial Information

Rating Considerations Details

Strengths

(1) **Debt is a direct obligation of the Province.** Manitoba Hydro is an agent of the Crown and its debt securities, except for $65 million of Manitoba Hydro-Electric Board Bonds (less than 1% of total debt at March 31, 2014), are held or guaranteed by the Province; therefore, the ratings assigned to Manitoba Hydro's obligations are a flow-through of the ratings assigned to the Province.

(2) **Low-cost hydro-based generation.** Low-cost hydroelectric-based generating capacity results in one of the lowest variable cost structures in North America, which has enabled Manitoba Hydro to provide electricity to its domestic customers at one of the lowest rates on the continent. This gives the Utility the flexibility to increase rates in the future, especially in light of the substantially heightened capex requirements.

(3) **Access to favourable export markets.** Manitoba Hydro's interconnections (approximately 43% of installed capacity), with firm export transfer capability of 2,100 MW to the United States, 150 MW to Saskatchewan and 200 MW to Ontario, along with additional non-firm transfer capability, provide the Utility with access to favourable export markets. The interconnections also provide a secure supply of electricity for domestic customers during times of poor hydrology.

Challenges

(1) **Hydrology risk.** Given that approximately 92% of Manitoba Hydro's installed generating capacity is hydroelectricity-based, earnings and cash flows are highly sensitive to hydrological conditions. The Utility is also exposed to significant price and volume risk because of its export commitments under the fixed price-to-volume contract, which may require the Utility to procure power supply from import markets if hydrological conditions are unfavourable.

(2) **High leverage.** Manitoba Hydro's leverage (79.4% as at March 31, 2014) remains one of the highest among government-owned integrated utilities in Canada, limiting its financial flexibility going forward. The Utility's leverage is also expected to increase modestly for the medium term because of the significant amount of planned capex.

(3) **High level of planned capex.** The need to refurbish aging infrastructure, combined with the aggressive development of new hydro generation and transmission facilities, will require Manitoba Hydro to deploy significant capital into its electricity infrastructure over the medium term. The Utility has forecast that capex over the medium term should average approximately $2 billion per year, which will pressure the already-high debt levels.

Major Projects (Under Construction and Planned)

Project	Estimated Cost ($ millions)	Planned Construction Start Date	In-Service Target Date
Bipole III Transmission Reliability Project	4,600	2013/2014	2018
Keeyask Infrastructure and Generating Station Projects	6,500	2014	2019/2020
Manitoba-Minnesota Transmission Project	350	2015/2016	mid-2020

- **Bipole III:** This project involves the construction of a 500 kilovolt (kV) high voltage direct current transmission line, along with new converter stations. Construction began over winter 2013/2014 and the transmission line is expected to be in service for 2018.
- **Keeyask Project:** This project includes the development of a 695 MW generation station on the Nelson River. Construction began in July 2014 with the first generator expected to be in service for 2019 and the remaining units to be in service by 2020.
- **Manitoba-Minnesota Transmission Project:** This proposed project involves the construction of a 500 kV alternating current transmission line from Winnipeg to the Manitoba-Minnesota border, where it will connect to the Great Northern Transmission Line to be built by Minnesota Power. The Province authorized Manitoba Hydro to proceed with the project in July 2014 and the Utility will file an environmental impact statement in 2015. This project is subject to regulatory approval by federal and provincial environmental processes.
- **Conawapa Generating Station:** This project is a 1,485 MW generating station to be built on the Lower Nelson River. The Province announced in July 2014 that study and planning on this project have been suspended at this time following the release of the PUB's NFAT report. The Province noted that this project may be brought back for independent review in the future if an improved business case with more confirmed export sales can be made.

(1) Adjusted for other comprehensive income.

F2014 Summary

- Manitoba Hydro's earnings increased in F2014 because of increased domestic consumption due to colder temperature and increases in electric rates.
- Extra-provincial revenues also increased as a result of favourable water conditions and higher prices.
- The higher earnings were slightly offset by an increase in fuel and purchased power costs.

F2015 Outlook

- The Utility has forecast lower earnings for F2015 because of a return to more normal winter conditions (compared to F2014) and higher depreciation and interest expenses as a result of the continuing high level of investment in infrastructure. This is expected to be slightly offset by the above-average water storage levels heading into F2015.

(1) Adjusted for other comprehensive income.

F2014 Summary

- Credit metrics have declined moderately over the past few years as the substantial amount of capex has led to an increase in debt levels. This trend is expected to continue in the medium term.
- Cash flow from operations increased largely because of higher earnings for the year.
- Capex remained elevated as the Utility spent $904 million in F2014 on new generation and transmission projects.
- The high level of capex resulted in a free cash flow deficit that was mostly funded through advances from the Province.

F2015 Outlook

- Capex is expected to remain elevated over the medium term as construction continues on the Bipole III and the Keeyask Projects.
- This high level of capex is expected to result in a negative free cash flow, which will likely be funded through advances from the Province. The increasing debt load may lead to further declines in Manitoba Hydro's key financial metrics.
- However, with no mandatory dividend payment requirements, this should provide the Utility with some financial flexibility.

Summary

- The Province supports Manitoba Hydro by advancing funds or guaranteeing the Utility's long-term debt issues. Long-term debt at March 31, 2014, consisted of the following:
  - $10,683 million in advances from the Province (all of which have annual sinking fund requirements).
  - $169 million Manitoba Hydro Bonds.
  - $158 million Manitoba Hydro-Electric Board Bonds.
- Only $65 million of Manitoba Hydro-Electric Board Bonds do not carry the provincial guarantee.
- Manitoba Hydro maintains a relatively smooth maturity profile with potential volatility from foreign currency debt mostly mitigated through natural and cash flow hedges, and a moderate level of floating-rate debt (19% of floating-rate debt and 7% of long-term debt to be refinanced within a year), which adds stability to debt servicing costs and minimizes interest rate risk.
- The Utility has bank credit facilities that provide for overdrafts and notes payable of up to $500 million denominated in Canadian and/or U.S. dollars. At March 31, 2014, there were no amounts outstanding. Manitoba Hydro issues short-term promissory notes in its own name for its short-term cash requirements and does not receive short-term funding from the Province. These short-term notes are guaranteed by the Province.

Regulation

Manitoba Hydro is governed by *The Manitoba Hydro Act* and its electricity and natural gas rates are regulated by the Manitoba PUB.

Electricity

- Each year, Manitoba Hydro reviews its financial targets with particular focus on its debt-to-equity target capital structure of 75% to 25%. If the Utility deems a rate adjustment is necessary to continue progress towards attainment of its financial targets, it submits a rate application to the PUB.
- The PUB reviews the rate adjustment application with the objective of allowing Manitoba Hydro to recover its cost of service and achieve its long-term debt-to-equity target. The PUB does not have the mandate to pre-approve capex. The capex planning responsibility resides with Manitoba Hydro and the government of Manitoba.
- In June 2012, Manitoba Hydro filed its 2012–13 and 2013–14 General Rate Application (GRA). In the GRA, the Utility requested an average 2.5% rate increase for all classes, effective September 1, 2012, and an additional 3.5% increase in overall revenues effective April 1, 2013.
- In order 43/13 dated April 26, 2013, the PUB provided final approval of a 3.5% rate increase across the board for all customer classes effective May 1, 2013. The order also provided final approval to the Utility's application to reinstate the 1.0% rate deferral as revenue in the 2012–2013 fiscal year. In addition, the 2.0% interim rate increase granted for April 1, 2012, and the 2.4% interim rate increase granted for September 1, 2012, were also approved.
- The Utility submitted an application for interim rates effective April 1, 2014, in March 2014. On May 6, 2014, the PUB approved a 2.75% increase in interim rates effective May 1, 2014.
- While Manitoba Hydro is the sole retail electricity supplier in Manitoba, under *The Manitoba Hydro Amendment Act* (the Act), other utilities may access the transmission system to reach customers in neighbouring provinces and states.
- The Act also explicitly allows Manitoba Hydro to build new generating capacity for export sales, to offer new energy-related services, to enter into strategic alliances and joint ventures and to create subsidiaries.
- There are presently no plans to move to full retail competition in the province.
- Manitoba retail customers currently enjoy rates that are among the lowest in North America as a result of Manitoba Hydro's predominantly hydroelectric generation and efficient resource management.

Natural Gas Distribution

- Manitoba Hydro distributes natural gas through its wholly owned subsidiary, Centra Gas Manitoba Inc. (Centra Gas). In accordance with the rate-setting methodology for natural gas, commodity rates are changed every quarter based on 12-month forward natural gas market prices.
- The commodity cost of gas is a pass-through with no markup to customers.
- Non-commodity costs, such as transportation, distribution as well as operating and general expenses related to the natural gas business are also passed on.
- The PUB allows Centra Gas to target an annual profit of approximately $3 million, which is fairly modest compared with Manitoba Hydro's consolidated earnings.
- On July 26, 2013, the PUB issued order 85/13, which approved an approximate 1% general revenue increase for gas operations, effective August 1, 2013.

The Manitoba Hydro-Electric Board

Report Date:
October 23, 2014

Watershed Storage Capacity

Manitoba Hydro draws water from five distinct watersheds: Nelson River, Winnipeg River, Saskatchewan River, Churchill River (including the Laurie River) and Burntwood River. This provides the Utility with some geographic diversification, especially during times of low hydrology. The main generation source is the Nelson River, which accounted for approximately 74% of power generated in F2014.

SOURCE OF ELECTRICAL ENERGY GENERATED AND IMPORTED

Source: Manitoba Hydro.

Favourable characteristics inherent in Manitoba Hydro's watersheds include the following:

- Cold temperatures reduce overall evaporation rates as much of the water is frozen for up to five months of the year.
- A significant portion of the watersheds consists of rock, which has lower seepage rates and higher runoff than predominantly soil-covered watersheds.
- Lake Winnipeg, Cedar Lake and Southern Indian Lake serve as large storage reservoirs. The Utility's water storage capacity is a competitive advantage in trading electricity (buying surplus U.S. power at low off-peak prices and selling its electricity during peak demand periods at higher prices).

In addition to its own generating stations in Manitoba, Manitoba Hydro purchases all electricity from two wind farms in southern Manitoba in St. Joseph and St. Leon. The installed capacity of these facilities is 258.5 MW. The Wuskwatim generation station is owned by the Wuskwatim Power Limited Partnership, in which Manitoba Hydro is the majority owner. Manitoba Hydro purchases all the electricity generated from the Wuskwatim generating station.

This Credit Analysis provides an in-depth discussion of credit rating(s) for Manitoba, Province of and should be read in conjunction with Moody's most recent Credit Opinion and rating information available on Moody's website.

Manitoba, Province of

Canada

Ratings

Manitoba, Province of

Category	Moody's Rating
Outlook	Negative
Senior unsecured bonds	Aa1

Overview and Outlook

Manitoba's Aa1 senior unsecured debt ratings benefit from (1) the diversity and stability of its economy; (2) the province's high degree of financial flexibility as evidenced by access to a broad and stable tax base; (3) manageable refinancing needs and exceptional access to capital markets; (4) high debt affordability as well as (5) adequate, though declining level of liquidity.

The rating is constrained by the province's high debt burden, which we expect to reach about 150% of revenues in 2016-17, versus 144% in 2013-14. Manitoba's deficits are small relative to other provinces and Manitoba enjoys financial flexibility. However, its plan to return to a small surplus by 2016-17 relies to a substantial degree on the province's ability to contain expenditure growth, which we view as challenging.

The negative rating outlook reflects our assessment of the execution risk surrounding Manitoba's plan to achieve a balanced budget by fiscal year 2016-17 and the risk of a continued increase in debt beyond 2016-17.

The outlook could be stabilized if Manitoba's debt burden as a percentage of revenues stabilizes and the province is on track to achieve a return to balanced budgets by 2016-17.

A loss of fiscal discipline leading to a continued and sustained increase in debt and debt service ratios beyond projections could exert downward pressure on the rating. This would be evidenced by reduced likelihood that Manitoba can return to balanced budgets by 2016-17 and reduced commitment to stabilize its debt burden in the medium term.

This Credit Analysis elaborates on Manitoba's profile in terms of the main analytic factors in Moody's Regional and Local Government Methodology.

Baseline Credit Assessment

Financial Performance and Debt Profile

Deficits are small but maintaining a tight grip on expenditures will be challenging

Manitoba's deficits are small and the province budgets for a deficit of 2.4% of total revenues (C$357 million) in 2014-15, which follows a deficit of 3.7% (C$522 million) in 2013-14. The province confirmed its deficit target for 2014-15 with the release of Q1 2014-15. However, we caution that the net financial impact of the recent flooding in summer has not yet been determined which might require some additional unbudgeted expenditures.

Manitoba seeks to return to balanced budgets by 2016-17. We view the province's target as challenging given continued pressures on healthcare (39% of total expenditures, 4.6% annual growth in 2013-14)) and education (24% of total expenditures, 6.7% annual growth in 2013-14) , similar to other provinces, and modest GDP growth. From 2014-15 to 2017-18 revenues are forecasted to grow on average by 3.3% per year including the impact of stable federal transfers while expenditures are expected to grow by only 1.9% during the same period. Manitoba has a solid track record of realizing efficiency gains and controlling departmental expenses providing some comfort that Manitoba can achieve its spending targets. However, we also note that the 2013-14 deficit of C$522 million was C$90 million higher than preliminary figures published as part of the 2014-15 budget earlier this year, after including a settlement provision for costs associated with effects of long standing flooding issues in four First Nations communities. In addition, total expenditures grew by 4.0% in 2013-14 after a year of tight expenditure control in 2012-13.

The province has substantial financial flexibility to raise taxes; however, willingness to raise taxes or constrain growth in provincial services may be limited by a modest economic growth environment and competition for skilled labour force from lower tax jurisdiction such as Alberta.

Stabilization of high debt burden

Manitoba's current debt burden is high. We expect that debt accumulation will continue to slightly outpace annual revenue growth as a result of small budgeted deficits until 2016-17 and capital spending under its 5-year C$5.5 billion infrastructure plan. We anticipate net debt to revenues to stabilize at around 150% by 2016-17 which compares to 144% in 2013-14 and 101% in 2008-09. Net direct and indirect debt should remain stable as a percentage of GDP (around 30%).

Unfunded pension liabilities of around 18% of revenues at March 31, 2014 remain manageable. In 2007-08, the province debt-financed C$1.5 billion of the Teachers' Retirement Allowance Fund (TRAF) unfunded liability. Investments held for the TRAF and the Civil Service Superannuation Fund (CSSF), which totaled C$2.2 billion in 2007-08, were reclassified and irrevocably restricted for pension purposes in 2008-09.

Continued high debt affordability

Over the last few years, Manitoba has rolled over maturing debt into debt with longer maturities and at comparatively low interest rates. Despite higher absolute debt levels, interest costs have consumed approximately 6% of revenues over the last five years, half of the comparable level in 2001. We expect interest burden to remain at current levels over the next 2-3 years even if interest rates were to rise modestly and assuming a moderate increase in debt. Manitoba faces refinancing needs of approximately C$2.0-2.5 billion every year from 2015-16, which is manageable.

Adequate, though declining level of liquidity funds

Manitoba's liquidity cushion is adequate with about C$2.6 billion in cash and investments (excluding sinking funds). Cash and investments are relatively low compared to expenditures (17% in 2013-14) and to debt (13% in 2013-14), which is also a reflection of the exceptional capital market access of Canadian provinces.

Cash and investments include approximately C$275 million of liquid funds in its Fiscal Stabilization Account. The province will draw C$55 million from the Fiscal Stabilization Account in 2014-15 for debt repayment. The fund is now well below its peak of C$864 million in 2008-09 and has limited cushion to absorb future drawings.

Inherent risks related to increasing debt at self-supporting entity Manitoba Hydro

The province issues debt on behalf of its wholly-owned utility company Manitoba Hydro, which we view as a self-supporting entity and therefore, exclude the related net debt from the Province of Manitoba's debt metrics. Manitoba Hydro's total reported debt net of sinking funds was around C$11.0 billion at March 31, 2014.The anticipated increase in debt at Manitoba Hydro could increase the contingent liability for the province of Manitoba in the next few years.

In anticipation of demand increases by 2022-23, and in order to boost electricity exports, Manitoba Hydro is currently executing major generation and transmission projects. Manitoba's financial metrics will be strained by the associated capital expenditures and debt needs in the coming years. In 2014-15, C$1.5 billion of C$2.4 billion in new debt that Manitoba seeks to issue will be for Manitoba Hydro. In addition, the management of these lengthy and complex construction projects will require additional attention from management. We will monitor the increase in Manitoba Hydro's debt ratios and the progress of construction of these projects.

We note positively, that Manitoba Hydro has flexibility to increase utility rates given fairly low rates compared to other provinces and that it has already negotiated future long-term export contracts with customers in the US. Please see the Credit Opinion for Manitoba Hydro for further details.

Governance and Management Factors

Manitoba relies on multi-year fiscal planning and prudent economic and fiscal assumptions to maintain a strong financial profile. Overall, Manitoba displays strong governance and management factors. Fiscal management measures are supported by comprehensive and transparent financial reporting that is typical of governments in advanced industrial economies.

Economic Fundamentals

Manitoba's economy is characterized by a high degree of diversification which provides access to a broad and productive tax base and supports economic stability. Approximately 11 sectors represent more than 5% of provincial GDP and manufacturing remains the largest sector (10% of provincial GDP). Manitoba's economy tends to perform approximately in line with the Canadian average and real GDP grew by an average 1.8% over the period 2008-13 compared to a Canadian average of 1.4%.

For 2014, real GDP growth is expected to be around 2.1%, benefiting from a pick-up in manufacturing and mining, while the agricultural sector is expected to decline following an exceptionally strong 2013. Manitoba's unemployment rate is among the lowest in Canada (5.4% in Manitoba, 7.1% in Canada in 2013) and its population has low household debt relative to other Canadian provinces.

Manitoba's economy has been hit by an increased frequency of major flooding in recent years and the province is stepping up investments in flood protection infrastructure, financed partially by a 1% increase in the provincial sales tax (PST) to 8%.

Institutional Framework

The institutional framework governing relations, powers and responsibilities between the Canadian provinces and the federal government is well developed and stable. This framework provides provinces with unfettered access to a broad range of tax bases and wide discretion over expenditure decisions, allowing provinces substantial flexibility to address fiscal challenges. Compared to their counterparts in other countries, including the German Länder and the Australian states, Canadian provinces enjoy far greater autonomy in terms of both the expenditure and revenue sides of their budgets. As such, Canadian provinces benefit from a high degree of fiscal policy flexibility that is more akin to that of sovereign governments than to many of their international sub-sovereign peers. These positive institutional factors increase Canadian provinces' ability to manage through economic downturns and handle relatively high debt burdens.

Extraordinary Support Considerations

Moody's assigns a high likelihood of extraordinary support from the Government of Canada (Aaa, stable), reflecting Moody's assessment of the incentive provided to the federal government of minimizing the risk of potential disruptions to capital markets if Manitoba, or any province, were to default. It also indicates a moderately positive federal government policy stance as illustrated by the flexibility inherent in the system of federal-provincial transfers.

National Peer Comparison

The Province of Manitoba is rated in the mid-range of Canadian provinces, whose ratings remain in a narrow range of Aaa to Aa2. Manitoba's debt burden is higher than that of some of its Western Canadian peers, but remains around the Canadian median. The province's highly diversified economy and resulting economic stability positions the province adequately relative to lower rated Canadian peers.

Opinion

Rating Drivers

Manitoba Hydro-Electric Board's (Manitoba Hydro) commercial paper program is explicitly guaranteed by the Province of Manitoba (Province).

Corporate Profile

Manitoba Hydro is an integrated electric and gas utility that is wholly owned by the Province as a Crown corporation and is regulated by the Manitoba Public Utilities Board (MPUB). Manitoba Hydro's 5,725 MW installed generating capacity produces over 90% of its electricity via hydroelectric power, complemented by two thermal and four diesel facilities, as well as power purchased from two independent wind farms. More than 20% of Manitoba Hydro's FY2014 electric revenue comes from exports to three Midwest US wholesale markets and other Canadian provinces. The smaller natural gas distribution segment, which sources its gas from Alberta, accounts for 8% of FY2014's total revenue net of procurement cost. Manitoba Hydro serves 555,760 electric and 272,228 gas customers in the Province.

SUMMARY RATING RATIONALE

Manitoba Hydro's Prime-1 commercial paper rating is driven by the Province's senior unsecured rating (Aa1/NEG) as the Province explicitly guarantees its commercial paper program. The commentary provided in the detailed rating considerations evaluates Manitoba Hydro as an electric utility corporation without layering in the guarantee. The commentary is provided solely for the benefit of investors as a reference as Manitoba Hydro's Prime-1 rating is determined by the Province's credit rating.

DETAILED RATING CONSIDERATIONS

OWNERSHIP BY THE PROVINCE OF MANITOBA

We view the Province's ownership of Manitoba Hydro as the anchor that links Manitoba Hydro's credit quality closely to that of the Province's. At FYE2014 , $10.7 billion of the $11 billion total debt consists of long term debt advances from the Province. Of debt obligations not owed to the Province, the Province guarantees Manitoba Hydro's short-term promissory note program (i.e. commercial paper program or CP) and its other long term debt (with the exception of Manitoba Hydro-Electric Board Bonds issued for mitigation purposes, which stood at $65 million at FYE2014). In turn, Manitoba Hydro is required to make sinking fund payments each year for no less than 1% of preceding fiscal year's principal debt outstanding and 4% of preceding fiscal year's sinking fund balance. In addition, the Provincial Debt Guarantee Fee is calculated as 1% of total guaranteed debt outstanding. Moody's continues to expect Manitoba Hydro to operate as a self-sufficient corporation to service its debt and afford payments to the Province such as water rentals and assessments.

LOW RATES IN A STABLE REGULATORY AND ECONOMIC ENVIRONMENT

Manitoba Hydro operates in a stable regulatory framework with steady yearly rate increases. It forecasts annual rate increases of 3.95% until FY2033 to contribute to replacing aging generation, transmission and distribution facilities. The rates are set on a cost-of-service basis. The MPUB independently oversees the rate setting process and has a supportive environment for cost recovery. Residents in Manitoba continue to pay rates that are among the lowest in North America. Revenues from exports to the US and other Canadian provinces accounts for over 20% of electric revenue, alleviating pressure of rate hikes and contributing to the current low rates in the Province.

NEW CAPACITY PLANNED TO MEET DEMAND AND BOOST EXPORT

To enhance reliability and in anticipation of demand growth and new generation needs in the next decade, major generation and transmission projects are underway. The 695 MW Keeyask Generating Station estimated at $6.5 billion is currently under construction with a projected in-service of 2019. Also under construction is the $4.6 billion Bipole III transmission line expansion with a projected in-service of 2018. As a result, capital expenditures are projected to increase and peak in FY2017.

The new capacity will be partially underpinned by fixed price long-term export contracts. Generation capacity from new hydro stations is developed in large "blocks" while demand grows incrementally. This creates an opportunity to sell surplus firm power under long-term contracts. Manitoba Hydro has already entered into long term contracts aggregating over 1,800 MW with Northern States Power, Minnesota Power, Wisconsin Public Service and Great River Energy. The contracts, which set electricity prices at a negotiated, fixed price remain subject to regulatory approval and are conditional upon the successful construction of the proposed plants.

In June 2014, the MPUB completed the Needs For and Alternatives To (NFAT) review of Manitoba Hydro's preferred development plan. In July 2014, the Keeyask project received its environmental license from the Province and construction started. The planning of the Conawapa Generating Station was suspended in August 2014 and whether it will be reactivated in the future is dependent upon further evaluation through the Integrated Resource Planning process and whether a strong investment case can be made.

FINANCIAL TARGETS TO BE CHALLENGED BY HIGHER CAPEX

As part of its debt management strategy, Manitoba Hydro targets certain financial metrics such as an interest coverage ratio greater than 1.2 and equity-to-capitalization greater than 25%. However, both targets are not expected to be met for an extended period of time due to large generation and transmission projects underway such as Keeyask and Bipole III. Total capital expenditures are forecasted to be $13 billion, or on average $2.6 billion per year from FY2015 to FY2019.

The weakening financial profile restricts financial flexibility and adds risk in case of unexpected events such as low water levels, cost overruns and construction delays given the nature of a hydroelectric plant's long construction cycle prior to the start of operations and cash flow. However, we view Manitoba Hydro as being capable of prudently managing debt and mitigating such risks by seeking rate increases and curtailing capital spending to continue as a self-supporting corporation.

Liquidity Profile

Manitoba Hydro's commercial paper is unconditionally guaranteed as to the principal and interest by the Province of Manitoba. Under the Manitoba Hydro Act, Manitoba Hydro can issue up to $500 million of commercial paper. While the Province does not maintain committed bank credit facilities in support of its short-term borrowing programs, Moody's believes that the probability that the Aa1-rated Province would be unable to obtain funding on a timely basis either from the capital markets or from its bankers is highly remote.

Rating Outlook

The outlook of Manitoba Hydro is stable, reflecting our expectation that the Province of Manitoba will continue to be the unconditional guarantor of Manitoba Hydro's commercial paper program. Manitoba Hydro is rated Prime-1 based on Moody's Global Short-Term Rating scale. The rating on the province would have to be downgraded 5 notches to A3 before we would downgrade Manitoba Hydro's Prime-1 rating to Prime-2.

What Could Change the Rating - Up

The Prime-1 rating is the highest short-term rating Moody's can assign and is indicative of a superior ability to repay short-term debt obligations. Therefore, Manitoba Hydro's Prime-1 rating cannot have any upward revision.

What Could Change the Rating - Down

Manitoba Hydro's Prime-1 rating is determined by the Province's long-term rating. Manitoba Hydro's Prime-1 rating could be revised downward to Prime-2 should the Province fail to maintain its long-term rating above A3.

2015/16 & 2016/17 GENERAL RATE APPLICATION

CAPITAL EXPENDITURE FORECAST

INDEX

Appendices

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

CAPITAL EXPENDITURE FORECAST

4.0 OVERVIEW

Tab 4 summarizes the Capital Expenditure Forecast (CEF14) and the capital investments required to meet the growing energy needs of Manitoba and to replace aging utility assets.

Sections 4.1 and 4.2 discuss Manitoba Hydro's Capital Expenditure forecast for Electric Operations (CEF14). Section 4.3 provides an overview of major new generation and transmission capital expenditures. Section 4.4 provides an overview of sustaining capital expenditure requirements. Section 4.5 summarizes the assets that are projected to enter into service. Section 4.6 provides more detailed information with respect to the condition of Manitoba Hydro's assets and future sustaining capital requirements.

The key conclusions with respect to Tab 4 are:

1. Historically, the reliability performance of Manitoba Hydro's electric system has been excellent, but has recently begun to degrade with the condition of the Corporation's assets more and more contributing to the decline in reliability.

2. Manitoba Hydro is entering a period of extensive capital investment to meet the growing energy requirements of Manitoba, to replace aging utility assets and address increased capacity needs on the system.

3. Manitoba Hydro's projected costs and revenue requirements are significantly increasing due to the investment in assets and are the key factors driving the need for rate increases.

4. The proposed 3.95% rate increases are the minimum required to continue to deliver a reliable energy supply to Manitobans, to which they are accustomed, and fund Power Smart Programs to assist customers in meeting their energy needs.

5. The key reliability risks associated with inadequate funding as a result of rate increases lower than 3.95% include:
   i. Reliability would degrade further; outages would be longer and more frequent;
   ii. Increased safety risks to public and staff; and
   iii. Increased maintenance and emergency costs.

4.1 CAPITAL EXPENDITURE FORECAST

The Capital Expenditure Forecast is a projection of Manitoba Hydro's capital expenditures for new and replacement facilities to meet the electricity requirements in the Province of Manitoba as well as expenditures required to meet firm sale commitments outside the Province. Expenditures included in the CEF provide for an ongoing safe and reliable supply of energy in the most efficient and environmentally sensitive manner. A copy of CEF14 is included as Appendix 4.1.

The CEF for the current year and subsequent nineteen year period is submitted annually to the MHEB for approval. Since capital construction projects typically span several years, each year's CEF is presented to the MHEB as a revision to the previous year's approved CEF. In addition to the identification of new projects, changes to previously approved projects are also identified.

Business Units' initiate capital expenditure proposals to meet energy load growth demands within the Province, to respond to specific customer service extension requirements, to improve the efficiency and reliability of the energy delivery system or to take advantage of revenue generating opportunities in the export market. Once the need for a capital project is identified, a Capital Project Justification (CPJ) is prepared by the initiating department. The CPJ contains detailed information relative to each project such as system load growth statistics, business case analysis, risk assessment, and other pertinent details. The requirement and justification for the project is reviewed at the department, division and business unit level before the CPJ is forwarded to either the responsible Vice-President or the Executive Committee of Manitoba Hydro for approval. Projects greater than $50 million require approval of the Executive Committee, items below $50 million are approved at the Business Unit level. Depending on the nature and complexity of the project, the CPJ may also be advanced to Manitoba Hydro's Planning Review Committee.

CPJs are scrutinized to confirm the need for the project based on the following criteria: system reliability, safety, efficiency, customer service, environmental impacts and corporate profitability. Further consideration is given to the priority of proposed projects and whether projects of lesser priority can be displaced so overall funding levels remain within the MHEB approved CEF limits. Risks of not proceeding with the project are also assessed based on information provided within the CPJ. All projects are assessed for environmental impacts.

During the year, actual expenditures on projects are reported monthly to Business Unit Management and the Executive Committee. Variance explanations are provided for any significant variances from the approved CEF. This information is also reported to the MHEB at their regularly scheduled meetings.

Each Vice-President oversees the portfolio of capital projects within their approved target. Advancement and deferral of capital projects occurs throughout the year to manage within annual approved funding levels. Available capital is allocated to asset categories in a prioritized manner to mitigate overall operational and financial risk.

4.2 ELECTRIC OPERATIONS CAPITAL EXPENDITURE FORECAST (CEF14)

The CEF includes Major New Generation & Transmission projects which increase capacity and energy or provide increased reliability and a number of specifically identified large projects or "major items" as well as numerous unspecified smaller projects referred to as "base items." Major and base items together comprise sustaining capital.

Figure 4.1 below provides a breakdown of Major New Generation and Transmission and sustaining capital by Business Unit over the 2014/15 to 2016/17 timeframe and the 10 year forecast period.

Figure 4.1 Summary of Electric Capital Expenditure Forecast CEF14

(in millions of $)	2014/15	2015/16	2016/17	Cumulative to 2023/24*
Major New Generation & Transmission	**1 452**	**1 914**	**2 463**	**11 671**
Sustaining Capital (Major & Base)	**571**	**577**	**610**	**5 661**

4.3 MAJOR NEW GENERATION & TRANSMISSION CAPITAL EXPENDITURES

The CEF14 includes Major New Generation & Transmission projects which significantly increase capacity and energy or provide increased reliability for the transmission system.

As noted in Figure 4.5, Major New Generation & Transmission expenditures continue to increase primarily due to the commencement of construction of the Bipole III Reliability project and the Keeyask Generating Station.

Figure 4.5 New Major Generation & Transmission 2013-2017

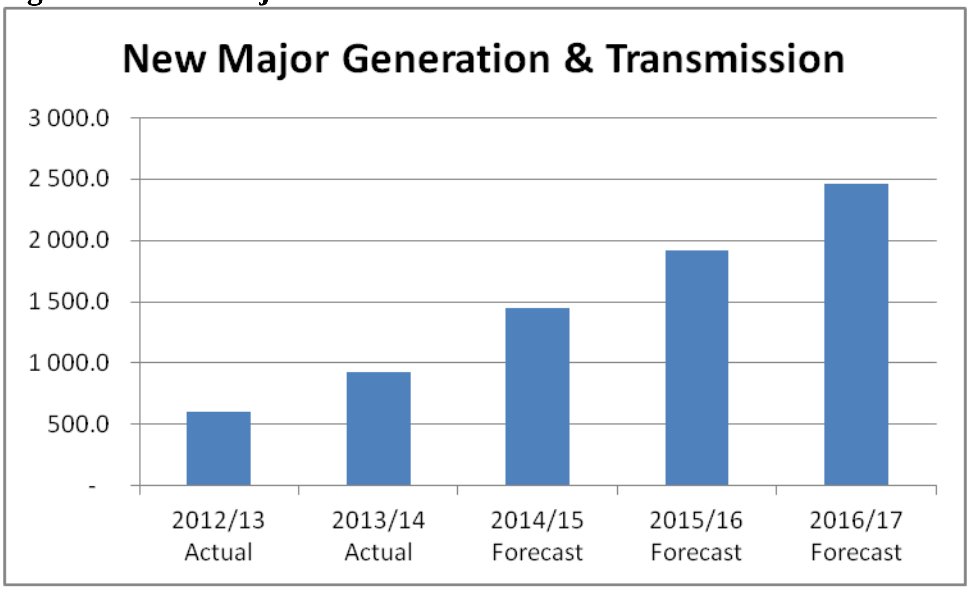

Figure 4.6 below summarizes the significant Major New Generation and Transmission capital projects.

Figure 4.6 Major New Generation & Transmission Capital Expenditure Forecast CEF14

(in millions of $)	2014/15	2015/16	2016/17	Cumulative to 2023/24*

* Excludes capital expenditures prior to 2013/14

The following sections provide a summary of cost updates with respect to the significant Major New Generation & Transmission projects and Electric Demand Side Management.

4.3.1 Bipole III Reliability Project

In August 2013, the Province of Manitoba issued an Environmental Act licence for the Bipole III Reliability project and construction has commenced with a planned in-service date of 2018/19, which represents a deferral of nine months from October 2017.

CEF14 incorporates a more detailed scope based on an issued Environmental Act licence, approved finalized route and right-of-way width and up-to-date market information. In addition, the revised estimate incorporates the awarding of major contracts and the selection of LCC technology, which has resulted in synchronous condensers being included in the updated estimate. The rating for the Bipole III Reliability project was increased from 2000MW to 2300MW to ensure adequate spare HVDC transmission on the northern collector system. Figure 4.7 provides an explanation of the major changes in the cost estimates.

Figure 4.7 Bipole III Reliability Total Project Cost Update

Cost Breakdown (in millions of dollars)	CEF 14	CEF 13	Increase	Explanation for change
HVdc Converter Stations (Riel & Keewatinohk)	1 878.3	1 208.8	669.5	- Increased for awarded contracts: HVdc Equipment, AC Switchyard, Site Development, Camp, Camp Operations, etc. - Addition of Synchronous Condensers to project scope as result of LCC converter technology selection - Increase to 2300 MW converters
500kV T-Line	1 191.0	889.0	302.0	- Increase for extended Licencing process - Increase for revised property acquisition costs - Increased clearing costs - Increase due to additional towers required
AC Collectors	198.2	115.0	83.2	- Addition of station upgrade and breaker replacement scope of work - Estimated increase to construction costs
Riel 230kV Expansion	228.7	133.4	95.3	- Increase from attribution of Riel Sectionalization costs (realized costs) - Estimated increase to construction costs
Contingency & Reserves	347.6	203.0	144.6	- Contingency & reserves included based on analysis and recommendation of 3rd party risk and contingency expert
Interest & Escalation	747.8	730.8	17.0	
Community Development Initiative	62.0	60.8	1.2	
TOTAL	**4 653.6**	**3 340.8**	**1 312.8**	

Total project change will not tie to 10 year cost flow change shown earlier due to rollover of under expenditures in 2013/14 compared to CEF13 forecasted flow.

4.3.2 Keeyask Generating Station

In July 2014 the Province of Manitoba issued an Environmental Act licence for the Keeyask Generating Station and construction has commenced with a planned in-service date of 2019/20.

The Keeyask Project budget was updated in March 2014 as part of the Needs For and Alternatives To review. The last detailed project estimate was completed in 2009. The budget includes bid prices from the major contractors including the General Civil Contract. Figure 4.8 provides an explanation of the major changes in the cost estimates.

Figure 4.8 Keeyask Generating Station Total Project Cost Update

Cost Breakdown (in millions of dollars)	CEF 14	CEF 13	Variance	Comments
Generating Station (Including GCC and KIP)	3 681.1	3 060.6	620.5	Increase related to: - updated base expenditures from 2013$ to 2014$ on generating station and KIP - post-construction adverse effects and operational employment which were previously excluded from the estimates. Accretion is also added. - commitments made in EIS and CEC hearings related to the environment and social mitigation. - direct negotiated service contracts, interface management, forebay clearing, and community monitoring. - stage 5 engineering and construction management staff augmentation. - Increase for awarded contracts. - unforeseen conditions related to the north access road construction, and work areas site development.
Construction Power	30.4	30.4	0.0	No Change
Licensing & Planning	393.0	397.3	(4.3)	Decrease related to transfer of budget for adverse effects.
Transmission (excluding contingency)	142.1	138.3	3.8	Increase related to updated base expenditures from 2013$ to 2014$.
Contingency & Management Reserves	685.2	1 063.7	(378.5)	Decrease related to: - Contingency and labour reserve revised based on updated risk model. - Escalation reserve revised based on updated escalation reserve model.
Interest & Escalation	1 564.2	1 530.3	33.9	Increase due to Interest on higher base costs and an advanced general civil contract cash flow; partially offset by decreased Escalation indexing from the increase to 2014$.
TOTAL	**6 496.0**	**6 219.6**	**276.4**	

Note: Sunk Costs are included in each project component

Total project change will not tie to 10 year cost flow change shown earlier due to rollover of under expenditures in 2013/14 compared to CEF13 forecasted flow.

4.3.3 Conawapa Generating Station

For CEF14 forecast purposes, it is assumed that the Conawapa Generating Station has been suspended and replaced with a gas turbine required in 2037/38 to meet firm capacity requirements. While the majority of the planning and licensing activities on Conawapa have been suspended, Manitoba Hydro continues to pursue dependable firm export sales based on the earliest possible in-service date of Conawapa in 2029/30 and will re-evaluate the business case (currently anticipated by Fall of 2016). Remaining expenditures in the forecast include capitalized interest on construction in process through to August 2016, the wrap up of preliminary engineering studies and limited environmental and aboriginal studies.

Figure 4.9 Conawapa Total Project Cost Update

(in millions of dollars)	CEF 14	CEF 13	Decrease	Explanation
Conawapa GS	397	10 492	(10 095)	Majority of expenditures have been suspended pending re-evaluation of the business case. Remaining expenditures are for the wrap up of preliminary engineering studies and limited environmental and aboriginal studies including capitalized interest on construction in progress through August 2016.

Total project change will not tie to 10 year cost flow change shown earlier due to rollover of under expenditures in 2013/14 compared to CEF13 forecasted flow and expenditures previously forecast outside the 10 year timeframe.

4.3.4 Demand Side Management

Manitoba Hydro's DSM plan targets the achievement of 1,136 MW and 3,978 GWh of savings over the next 15 years and involves an investment of more than a billion dollars and will be relied upon to meet 66% of projected load growth during this period. Figure 4.10 provides an explanation of the major changes over the 10 year forecast period associated with the updated DSM plan.

Figure 4.10 DSM 10 Year Cost Flow Update

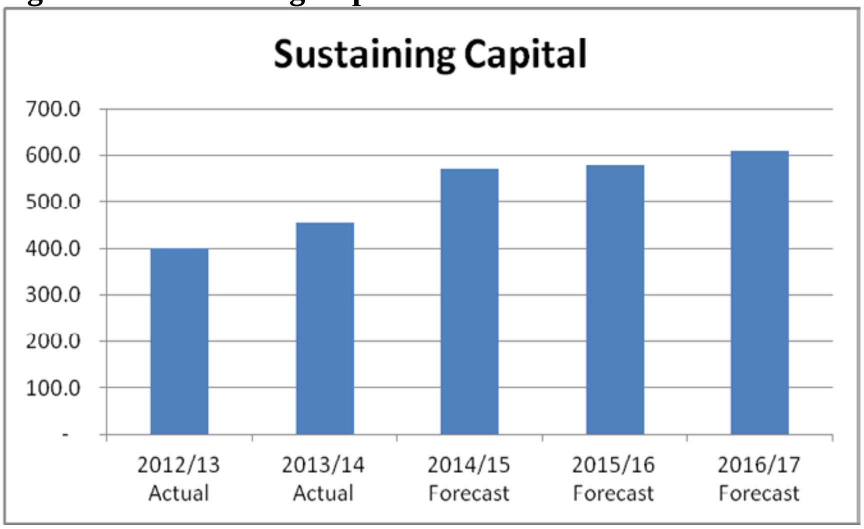
Cost breakdown (in millions) 10 Year	CEF 14	CEF 13	Increase / (Decrease)	Explanation
Residential Energy Efficiency Programs	$68.7	$4.9	$63.8	Extended and enhanced program offerings and added new programs including but not limited to introducing Residential LED Lighting program and increased insulation incentives and introduced free energy assessments for electrically heated homes.
Commercial Energy Efficiency Programs	$210.4	$69.7	$140.7	Extended and enhanced program offerings and added new programs including but not limited to adding direct installation of high efficiency pre-rinse spray valves to the Commercial Kitchen program, higher performance levels beyond the new energy code for buildings, and increased incentives and technical assistance to support energy modeling under the Commercial New Buildings program, and increased incentives under the Refrigerator Retirement, Commercial Lighting, Commercial Building Envelope, Commercial CO2 Sensors, and Commercial Refrigeration programs.
Industrial Energy Efficiency Program	$102.0	$27.7	$74.4	Enhanced program offering by expanding financial and technical support for embedded energy managers in large commercial and industrial facilities under the Industrial Performance Optimization Program.
Load Management Program	$65.8	$57.7	$8.0	Enhanced program offering by increasing incentives in the Curtailable Rates Program.
Load Displacement & Alternative Energy Programs	$97.8	$8.8	$89.0	Added customer sited load displacement program.
Conservation Rates	$26.3	-	$26.3	Added conservation rates for residential and commercial customers.
Fuel Choice Program	$55.1	-	$55.1	Added fuel choice program.
Support & Contingency	$50.1	$44.7	$5.4	Increased activities to support the enhanced DSM portfolio such as increased program evaluation activities including external evaluation consulting services.
Demand Side Management	**$676.2**	**$213.4**	**$462.8**	

4.4 SUSTAINING CAPITAL EXPENDITURES (MAJOR & BASE CAPITAL)

Sustaining capital includes items identified in CEF14 as either Major or Base capital expenditures and consists of additions, improvements and replacements of existing infrastructure.

Capital targets established for fiscal years 2014/15 through 2020/21 in CEF14 considered increased requirements for aging infrastructure based upon asset condition assessments as well as expansion requirements to support customer growth. The target adjustment of $25 million annually beginning in 2016/17 through 2020/21 provides funding to address future priorities. Investment in sustaining capital has increased $428 million over the ten year forecast period in order to maintain reliability and address anticipated load and customer growth as further discussed in Section 4.6.

Figure 4.11 Sustaining Capital 2013-2017



The following figure provides a further breakdown of sustaining capital for the first three forecast years of CEF14. Capital expenditures have been broken down by asset type, identifying the investment required to maintain reliable service.

Figure 4.12 CEF14 Sustaining Capital by Asset Type

(in millions of dollars)	2015	2016	2017

4.5 CAPITAL IN-SERVICE

While assets are under construction, the capital expenditures and associated financing costs are held in construction work in progress. Once these assets are placed into service, the associated carrying costs (depreciation and finance expense) form part of the Corporation's revenue requirements.

Figures 4.13 and 4.14 provide a summary of the amount of capital that is forecast to go in service, as well as deferred assets that will commence amortization for the first three forecast years as well as the 10 year forecast period. Figure 4.13 indicates that $1.7 billion, $0.8 billion and $1.3 billion of assets are projected to be placed in-service in 2014/15, 2015/16 and 2016/17 respectively. The most significant assets being placed in-service during this period include the Pointe du Bois spillway replacement, and the Riel 230/500kV Station in 2014/15. In this three year period, there is also approximately $1.8 billion of sustaining capital expenditures that will be placed into service, and $0.2 billion of DSM expenditures that will commence amortization.

4.6 INVESTING TO MAINTAIN RELIABLE SERVICE

Manitoba Hydro's asset management has enabled the Corporation to defer hundreds of millions of dollars of capital investment to date. However, increased investments are required for generation, transmission and distribution system renewal and capacity expansion in order to support the growth requirements of Manitoba Hydro's customers. These capital investments are needed to sustain the Corporation's current electric infrastructure considering the increasing pressures associated with aging infrastructure and the need to provide more capacity to accommodate increased demand resulting from increased population and business growth. CEF14 forecasts capital expenditures of $493 million, $498 million and $525 million in 2014/15, 2015/16, and 2016/17, respectively for investment in generation, transmission and distribution assets (does not include expenditures associated with corporate infrastructure).

4.6.1 Impacts of Aging Infrastructure on Reliability

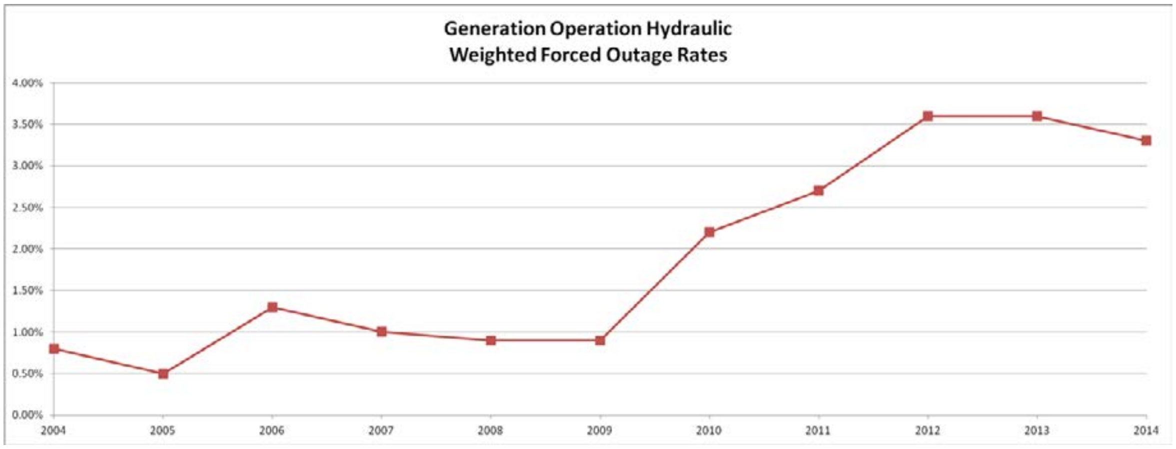
Manitoba Hydro has prudently invested in the electrical system which has provided reliable service to customers for decades. Where system reliability risk dictates, Manitoba

Hydro has installed redundant capacity to ensure that it can supply load in the event of an outage in an acceptable timeframe. Contingency plans, such as the transfer of load to available stations, the use of mobile stations, and allowing temporary overloads on equipment where it can be determined that such overloads are not expected to appreciably reduce equipment life, allow the Corporation to supply load at acceptable voltage levels after a system outage occurs.

In the past, Manitoba Hydro has been able to effectively deal with capacity challenges on its system by taking advantage of redundant capacity and contingency plans which has allowed the Corporation to defer capacity upgrades while maintaining reliability levels. However, the number of areas of the electric system with capacity challenges is growing, and this is the result of an aging system and strong load growth in some parts of the Province. Consequently, Manitoba Hydro's ability to respond to these challenges without negatively impacting reliability is diminishing.

Reliability is critical for Manitoba Hydro and its customers. Historically, the reliability performance of Manitoba Hydro's electric system has been excellent, but has recently begun to degrade. While reliability is impacted by factors such as adverse weather, tree contacts, and the lengthening of restoration time due to changes in work procedures to conform to safety, legal and environmental requirements, the condition of Manitoba Hydro's assets is contributing more and more to the decline in reliability. This is evident in Manitoba Hydro's performance in key reliability indicators. As illustrated in Figure 4.15 below, generation forced outage rates have significantly increased in the past four years.

Figure 4.15 Hydraulic Generation Forced Outage Rates



Likewise, Manitoba Hydro's recent performance on the System Average Interruption Duration Index (SAIFI) and the System Average Interruption Frequency Index (SAIDI) indicators (with the exception of 2013 which reflects lower than normal storm activity) shows a trend of increased outage frequency and duration.

Figure 4.16 Manitoba Hydro SAIDI and SAIFI Indicators

	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	Projected 2014

SAIFI	1.14	1.4	1.23	1.27	1.31	1.46	1.44	1.51	1.96	1.3	1.55

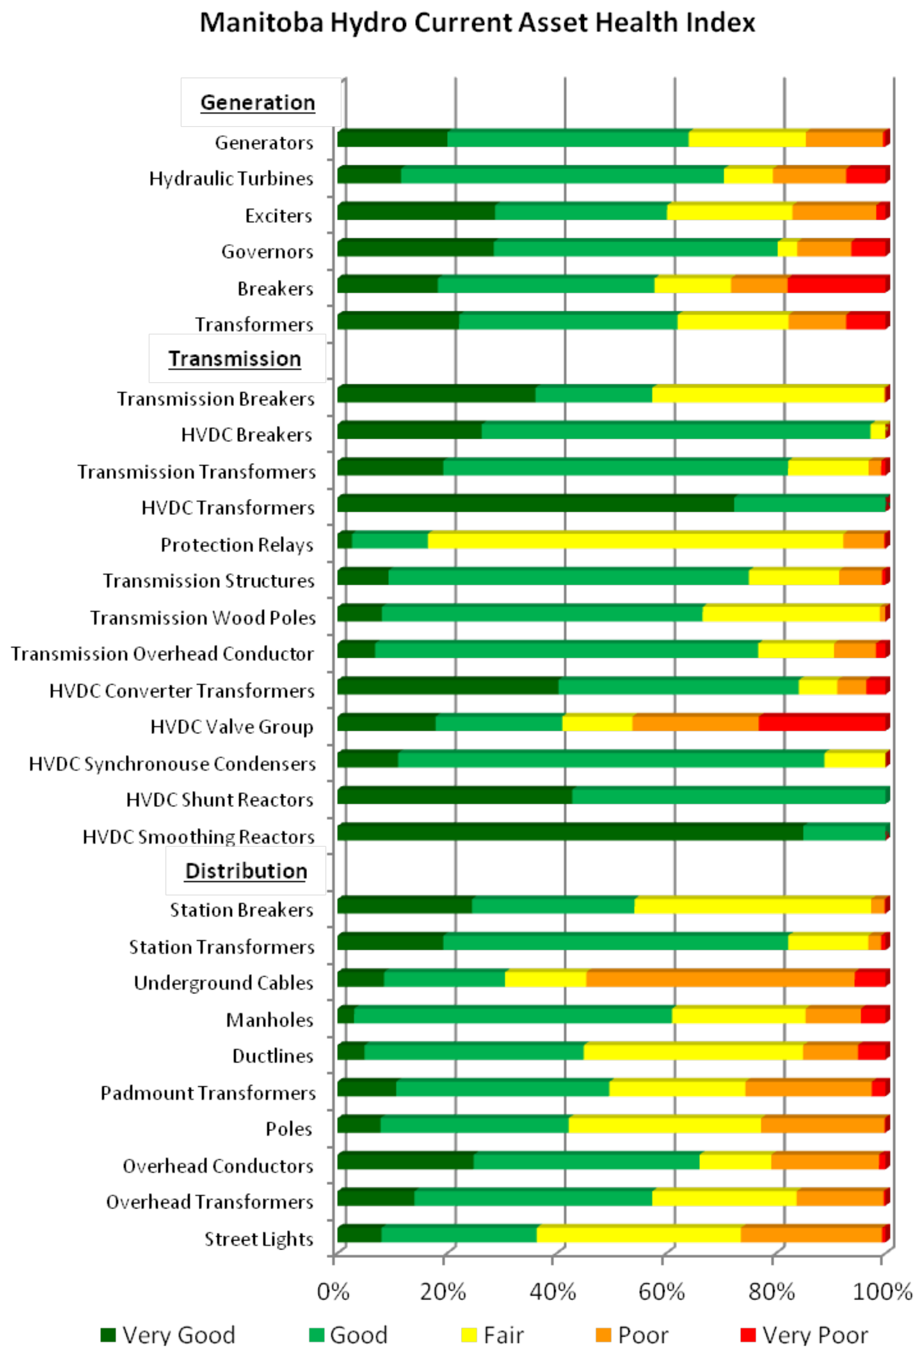
Manitoba Hydro has been taking actions for many years to mitigate the impacts of aging infrastructure on reliability performance, such as implementing an integrated pole maintenance program that has allowed the Corporation to extend the pole asset serviceable life well-beyond industry standards, and more recently, leveraging cable silicone injection technology to extend the serviceable life of underground cables. However, significant capital investments are required to address aging infrastructure and increased capacity needs on the system.

A considerable amount of Manitoba Hydro’s assets were installed prior to 1960 when many of the first generating stations and transmissions systems were built (1911-1950) and a large portion of the province was electrified (1940-1960). Many of these assets have been well maintained or overhauled and are still in operation, providing decades of valuable service to the Corporation and its ratepayers. A large number of assets were subsequently installed from 1960 through to 1990 when generating stations were developed on northern Manitoba river systems along with the supporting HVDC system to transport the electricity to customers in the south.

Many components of this generation, transmission and distribution system are coming due for replacement, with some components requiring investments in the short term. Some of Manitoba Hydro’s assets are in poor condition with ages well beyond industry standards and present a significant risk of failure which can result in customer outages and/or load shedding. Some of these assets types, such as breakers, generators, wood poles and valve groups, also require significant resources, lead time and capital investment to address their present condition. Though assets are being continually maintained, current levels of system reliability will not be sustained with current asset replacement rates.

As Appendix 4.2 to this Tab, Manitoba Hydro has included its Electric Infrastructure Condition Assessment Report. The report provides an overview of the condition of major electrical assets and their demographics, as well as an overview of critical assets’ life expectancy versus the current replacement rates and the quantities of assets in critical condition. Manitoba Hydro used an Asset Health Index (AHI) to quantify equipment condition based on numerous parameters, as described in section 3 of Appendix 4.2. A condition index was calculated for each asset indicating whether the asset type is in very poor, poor, fair, good or very good condition. Figure 4.17 below provides a summary of current AHI results for Manitoba Hydro’s generation, transmission and distribution asset types.

Figure 4.17 Current Asset Health Index by Asset Type



Manitoba Hydro can effectively manage its assets through the use of maintenance, spares and contingency strategies when the majority of assets in a particular asset class are in fair to very good condition. However, as larger percentages of these assets fall into the poor and very poor categories, system failures regretfully will occur more frequently.

It is notable that the majority of critical assets are being replaced at levels substantially less than their anticipated lifespan. Today, a majority of the asset types have equipment which remains in service well beyond industry expectations, without causing significant impact to reliability. Going forward, as a larger percentage of assets age beyond life expectancy, significant changes to current replacement rates[1] will be required to mitigate the negative impacts of aging infrastructure on the electrical system. Figure 4.18 illustrates turnover at current replacement rates[2], indicating that replacement rates in the majority of Manitoba Hydro's asset types need to be increased to better align with life expectancy.

Figure 4.18 Asset Type Life Expectancy and Turnover at Current Replacement Rates

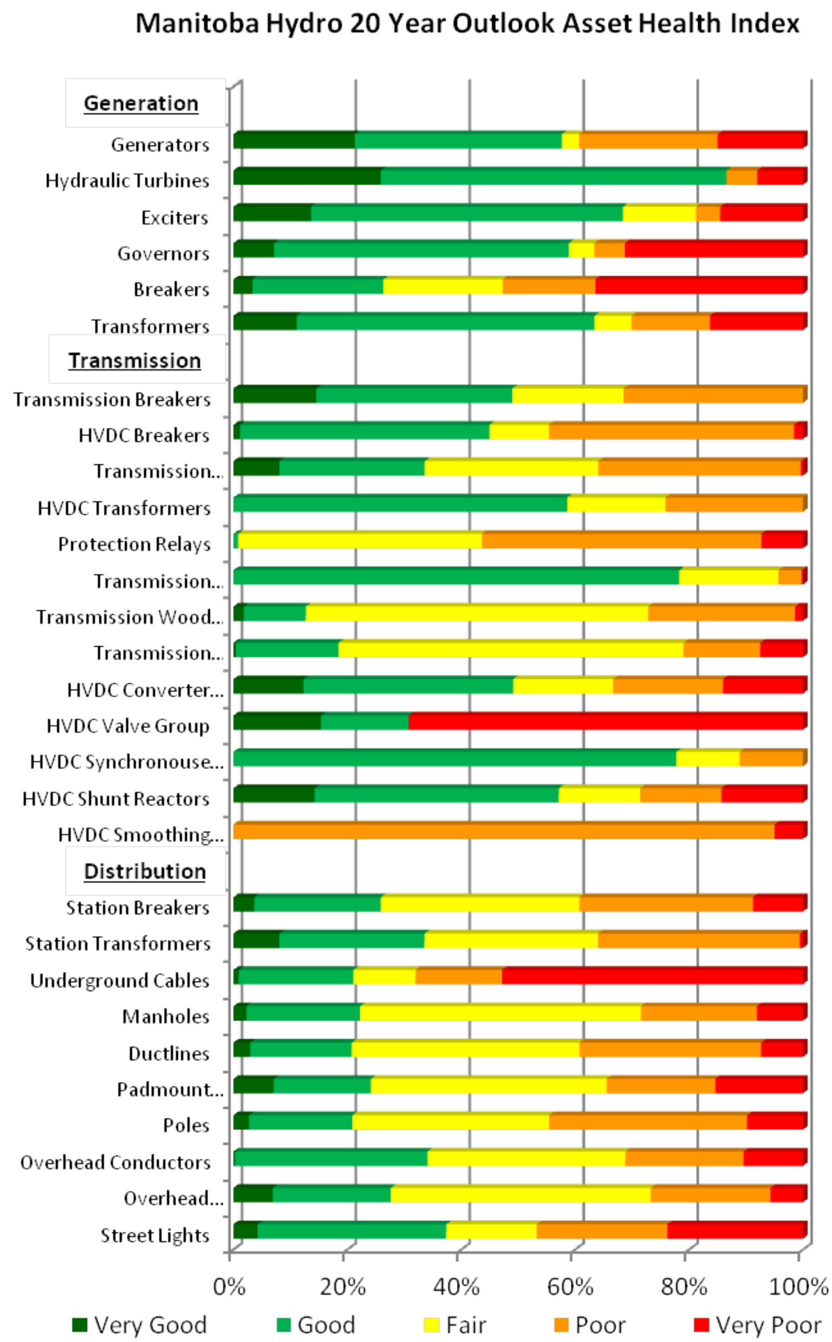
Business Unit	Asset	Life Expectancy (years)	Turnover at Current Replacement Rates (years)
Generation	Generators	60	117
	Hydraulic Turbines	90-100	84
	Exciters	50-90	117
	Governors	20-125	50
	Breakers	60-65	129
	Transformers	40-70	150
Transmission	Transmission Breakers	60-65	149
	HVDC Breakers	60-65	58
	Transmission Transformers	40-70	152
	HVDC Transformers	40-70	70
	Transmission Structures	85	285
	Transmission Wood Poles	75	255
	Transmission Overhead Conductor	85	410
	HVDC Converter Transformers	40-50	73
	HVDC Valve Group	25	48
	HVDC Synchronouse Condensers	65	65
	HVDC Shunt Reactors	35	55
	HVDC Smoothing Reactors	25	30

[1] The replacement rate is the average number of assets replaced each year divided by the total number of in service assets.
[2] Turnover at Current Replacement Rate is the number of years it would take to replace all our existing in service assets at current replacement rates.

Business Unit	Asset	Life Expectancy (years)	Turnover at Current Replacement Rates (years)
Distribution	Station Breakers	60-65	180
	Station Transformers	40-70	370
	Underground Cables	30-70	328
	Manholes	80	500
	Ductlines	100	378
	Padmount Transformers	50	70
	Wood Poles	70	200
	Overhead Conductors	100	200
	Overhead Transformers	75	70
	Street Lights	50-70	100

The original cost of Manitoba Hydro's electric assets is approximately $16 billion with an estimated replacement value many multiples higher due to inflation, increases in commodity prices and other factors. An asset portfolio of this size requires significant reinvestment to ensure that performance and safety standards are achieved. As a result, it is essential that investments on asset renewal be undertaken. Manitoba Hydro will continue to extend the life of its assets to the extent feasible based on economic and risk assessments, however, current replacement rates do not allow for a sustainable electrical system in the near future. Figure 4.19 demonstrates the impact to asset health if current replacement rates are maintained, indicating a trend toward less asset reliability as more slip into the poor and very poor condition.

Figure 4.19- 20 Year Outlook Asset Health Index by Asset Type



As discussed in Appendix 4.2, it is expected that over the next 20 years more assets will slip into poor and very poor condition, which will result in lower reliability than experienced historically, reduced revenues, increased safety risks to public and employees, increased maintenance costs, increased emergency restoration costs and consequential damages. In addition, internal resource levels to address both maintenance and asset replacement requirements would be strained and the ability to secure external resources may be limited.

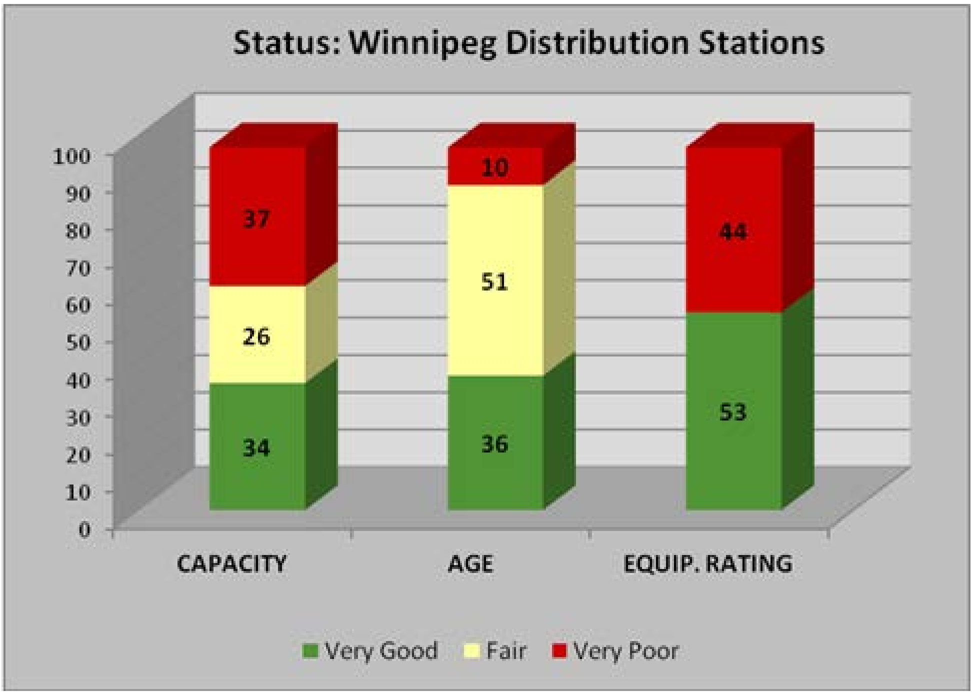
4.6.2 Capacity Constraints Impacting System Performance & Customer Growth

In conjunction with the impacts of aging infrastructure, Manitoba Hydro is facing significant capacity issues. Electric load in an increasing number of service areas has grown to the point where Manitoba Hydro may not be able to adequately supply load in the event of an outage despite contingency plans. Capacity challenges also make it more difficult to respond to customer connection requests. The Corporation has identified a number of capital investment priorities for its distribution and transmission systems related to capacity and investments are being undertaken and will be required in the near future to address these capacity issues.

For example, significant capital investment in distribution stations in Winnipeg and rural Manitoba is required as a large number of the stations are currently overloaded. There are 276 distribution stations in rural Manitoba; 19 of these are loaded above their maximum capacity, while 27 stations are at or above 80% of their loading limit. There are areas of the Province experiencing load growth much higher than the system average. In addition, there are areas of the province where the distribution system is near its end of life. In areas where these issues intersect, investment requirements become more important, such as in the Steinbach area, the Morden/Winkler area, Western oil fields, Brandon South and the Eastern Lake Winnipeg Area. As is noted below, the transmission system that supports the distribution in these areas is also facing capacity challenges.

Likewise, current Winnipeg distribution system capacity is not sufficient to meet current or future loads, which results in a high likelihood of extended outages to customers. Figure 4.20 provides an overview of the current status of the distribution system in the City of Winnipeg.

Figure 4.20 Status of Distribution Stations in Winnipeg



There are 97 distribution stations supplying the City of Winnipeg; 37 stations are currently loaded beyond their maximum capacity, and 26 stations are at or above 80% of their loading limit. The in-service dates of substation capacity projects can be deferred by transferring load to other, less loaded stations; however, the use of this strategy has been exhausted and is no longer practical. Contingency plans have become ineffective to restore full load in the event of an outage. Furthermore, ten of the distribution stations are 61 years or older, exceeding the design life of the equipment, and 44 stations have fault levels that exceed equipment ratings under certain operating conditions, such as during extreme low temperatures where electrical demand is typically highest.

Based on current capital plans, Manitoba Hydro is working towards reducing the percentage of overloaded distribution stations in Winnipeg to 20% by 2020 and in rural Manitoba by 5% in 2015 with a long term objective of ensuring that no stations exceed their maximum rating. Achieving this objective requires significant investments today and in the coming years. This issue is of significant concern, not only as it limits Manitoba Hydro's ability to supply electricity reliably to existing customers, but also in light of the expected load additions in many areas of the Province, including downtown Winnipeg where load additions are much larger than anticipated. It is estimated that service extensions are required for approximately 5,300 new electric customers each year across the Province.

Similarly, Manitoba Hydro's transmission system is facing significant capacity issues. There are a number of areas in the transmission system where significant investments are required in order to address higher than average load growth, deteriorating voltage levels, and/or impacts of increasing transmission system capacity on some existing system equipment. Manitoba Hydro has also identified a number of high-priority transmission capital investments to address capacity requirements that will need to be undertaken.

As noted above, Manitoba Hydro has experienced higher than average load growth in areas such as the eastern Lake Winnipeg area, the Winkler/Morden area, and the Steinbach area which exceed the firm capacity of its stations, and/or result in low voltage issues. In the Eastern Lake Winnipeg, load has grown beyond the maximum capacity of Pine Falls Station, a key station that supplies the area, and over the next several years, the load is expected to grow to the point that overloads could not be reduced to acceptable levels by transferring load to other stations, potentially resulting in transformer damage or rotating load shed in a difficult to serve region of the Province.

With respect to the Morden/Winkler area, the 115 kV transmission system supplying the area can experience low voltage issues, particularly during peak load conditions and outages on the system. In such cases, rotating load shed during peak winter loading conditions may be required to restore system voltages to acceptable levels.

Likewise, the Winnipeg area has become heavily loaded due to load growth and upgrades to the transmission system are required, including the construction of a new transmission line, in order to protect against blackouts, and improve the system performance and reliability during normal operations as the load grows in southern Manitoba. In addition, as the capacity of the Winnipeg area transmission system continues to increase, the ratings of some system protection/interrupting equipment in the area are expected to be exceeded. This necessitates the replacement of breakers in order to avoid potential harm to employees, the public and infrastructure.

As well, steady load growth in Western Manitoba has resulted in deteriorating voltages on the transmission system in the Portage South area, which is impacting local load and Saskatchewan export capabilities and the ability to supply new oil pipeline related load.

If the capacity-related projects are not undertaken, customers in the impacted areas would be at a higher risk of extended outages and there is a risk that Manitoba Hydro could potentially be subject to significant financial penalties if having to report North American Electric Reliability Corporation violations.

Addressing the above matters will require investments in new transmission lines, investments to address station overloading, capacity upgrades and new construction to accommodate future load growth.

The continued provision of safe and reliable service requires Manitoba Hydro to undertake investments today and in the near future. The proposed rate increases will ensure that there is adequate funding available to make the necessary investments.

Overview

Capital Expenditure Forecast Summary
Comparison to CEF13
Capital Expenditure Forecast Summary Table

1.0 Overview

The Capital Expenditure Forecast (CEF14) is a projection of Manitoba Hydro's capital expenditures for new and replacement facilities to meet the electricity and natural gas service requirements in the Province of Manitoba as well as expenditures required to meet firm sale commitments outside the province. Expenditures included in the Capital Expenditure Forecast will provide for an ongoing safe and reliable supply of energy in the most efficient and environmentally sensitive manner.

The Capital Expenditure Forecast is comprised of a number of specifically identified large projects or "major items" as well as numerous unspecified smaller projects referred to as "base items." Major items are normally greater than $50 million in total cost and the construction period on each major item usually extends beyond one year. Base capital expenditure items typically represent sustaining capital requirements to meet electricity and natural gas service replacements and expansions throughout the province. All major and base capital projects are subjected to a rigorous review and approval process before being included in the Capital Expenditure Forecast

The CEF14 includes Major New Generation & Transmission projects which increase capacity and energy or provide increased reliability. In August 2013, the Province of Manitoba issued an Environmental Act licence for the Bipole III Reliability project and construction has commenced with a planned in-service date of 2018/19. In July 2014 the Province of Manitoba issued an Environmental Act licence for the Keeyask Generating Station and construction has commenced with a planned in-service date of 2019/20. Manitoba Hydro continues to develop the Manitoba-Minnesota Transmission Project, a transmission interconnection into the U.S. which supports enhanced export capability, reliability and drought risk mitigation. The Province also endorsed Manitoba Hydro's new, more aggressive demand side management PowerSmart plan which targets a 250% increase in consumption savings.

For CEF14 forecast purposes, it is assumed that the Conawapa Generating Station has been suspended and replaced with a gas turbine required in 2037/38 to meet firm capacity requirements. While the majority of the planning and licensing activities on Conawapa have been suspended, Manitoba Hydro continues to pursue dependable firm export sales based on the earliest possible in-service date of Conawapa in 2029/30 and will re-evaluate the business case (currently anticipated by Fall of 2016).

Base capital targets established for fiscal years 2014/15 through 2020/21 in CEF14 considered increased requirements for aging infrastructure based upon asset condition assessments. Beginning in 2021/22, base capital targets are escalated at a minimum 2% annually.

Capital Expenditure Forecast Summary

The CEF14 totals $25 953 million for the twenty year period to 2033/34. Expenditures for Major New Generation & Transmission (MNG&T) total $12 611 million, with the balance of $13 342 million comprised of expenditures for infrastructure renewal, system safety and security, new and increasing load requirements, and ongoing efficiency improvements.

Comparison to CEF13

The CEF14 for the twenty year period to 2033/34 totals $25 953 million compared to $33 474 million for the same twenty year period included in last year's Capital Expenditure Forecast (CEF13).

Section 2

Project Summaries

ELECTRIC OPERATIONS:

MAJOR NEW GENERATION & TRANSMISSION:

Wuskwatim - Generation

Description:
Design and build the new Wuskwatim generating station with three generators and installed capacity of approximately 200MW on the Burntwood River upstream of Thompson.

Justification:
This project increases generation for both export power purposes and domestic load requirements.

In-Service Date:
First power June 2012

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 1 448.6	$ 23.8	$ 12.1	$ -	$ -	$ -	$ -
Increase (Decrease)	-	16.7	0.8	14.7	-	-	-
Revised Forecast	$ 1 448.6	$ 40.5	$ 12.9	$ 14.7	$ -	$ -	$ -

Keeyask - Generation

Description:
Design and build the Keeyask generating station with seven generators and nominal capacity of 695MW on the Nelson River downstream of the Kelsey generating station. Project costs also include activities necessary to obtain approval and community support to proceed with the construction of the future generating station. These costs are comprised of extensive First Nations and other community consultations, pre-project training, joint venture business developments, environmental studies, impact statement preparations, submissions, regulatory review processes, detailed pre-engineering requirements, acquiring all necessary licensing, the design and construction of associated transmission facilities, and improvements to access roadways.

Justification:
This project increases generation for export power purposes and ultimately domestic load requirements.

In-Service Date:
First power November 2019

Revision:
The Keeyask Project control budget was updated in March 2014 as part of the NFAT review of the preferred development plan. The last detailed project estimate was completed in 2009. The control budget includes bid prices from the major contractors including the General Civil Contract, current budget of the Keeyask Infrastructure Project and cost flow revisions.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 6 220.1	$ 471.0	$ 639.3	$ 865.1	$ 1 111.4	$ 942.3	$ 1 201.1
Increase (Decrease)	276.0	305.3	37.1	97.1	239.9	(14.4)	(316.3)
Revised Forecast	$ 6 496.1	$ 776.3	$ 676.3	$ 962.2	$ 1 351.3	$ 927.9	$ 884.8

Grand Rapids Hatchery Upgrade and Expansion

Description:
Expand the capacity of the existing facility through tank replacement/reconfiguration and upgrade of supporting water treatment infrastructure. Modifications to the Research Centre (a separate facility on the GRH site), including well and potable water supply, to serve as a temporary production facility during hatchery upgrade and expansion, and the purchase of portable satellite facilities to allow for fish rearing during hatchery construction. Install electrical service from Grand Rapids Generating Station service to the hatchery.

Justification:
Upgrades to the Grand Rapids hatchery are a requirement of the Keeyask Environment Act licence as well as recently introduced national and provincial regulatory requirements for water quality and biosecurity.

In-Service Date:

March 2018

Revision:
New item.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ -	$ -	$ -	$ -	$ -	$ -	$ -
Increase (Decrease)	23.5	1.9	4.7	9.3	6.8	-	-
Revised Forecast	$ 23.5	$ 1.9	$ 4.7	$ 9.3	$ 6.8	$ -	$ -

Conawapa - Generation

Description:
Design and build the Conawapa generating station with ten generators and nominal capacity of 1 485MW on the Nelson River downstream of the Limestone generating station. Project costs also include activities associated with extensive First Nations and other community consultations, pre-project training, environmental studies, impact statement preparations, submissions, regulatory review processes, acquiring all necessary licensing, improvements to access roadways, and detailed pre-engineering required to obtain a license and all necessary approvals to construct the Conawapa generating station.

Justification:
This project increases generation for export power purposes and ultimately domestic load requirements.

In-Service Date:
Under review pending re-evaluation of the business case.

Revision:
Majority of expenditures have been suspended pending re-evaluation of the business case. Remaining expenditures are for the wrap up of preliminary engineering studies and limited environmental and aboriginal studies including capitalized interest on construction in process through August 2016.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 10 491.5	$ 70.1	$ 125.9	$ 99.4	$ 240.6	$ 308.1	$ 9 317.0
Increase (Decrease)	(10 094.5)	(26.7)	(94.5)	(78.4)	(240.6)	(308.1)	(9 317.0)
Revised Forecast	$ 397.0	$ 43.4	$ 31.4	$ 21.0	$ -	$ -	$ -

Kelsey Improvements & Upgrades

Description:
Overhaul and uprate all seven Kelsey generating station units including the replacement of turbine runners, bottom rings, discharge rings or weld overlays, transformers, generator windings and exciters. Perform model testing to refine runner design, perform extensive intake gate rehabilitation, perform draft tube modifications, perform an 8 000 hour inspection, and upgrade rail spur and overhead crane. Upgrade transmission facilities necessary to integrate the additional Kelsey generation into the Manitoba Hydro system network.

Justification:
Rerunnering presents the best economic solution for increasing efficiency at the Kelsey generating station and for adding system capacity without flooding or requiring a new water power license. Overhauling the units will improve the unit output by up to 11MW per unit. The transmission upgrade of a portion of the Kelsey 138 and 230kV buses and the revisions to the Northern AC Cross Trip scheme are required to accommodate the 77MW of additional Kelsey output.

In-Service Date:
October 2016

Revision:
In July 2013, the overhauls on all seven units had been completed and placed back in-service. Significant work remains to fix deficiencies on the head covers of all the units to improve safety and reliability. Wastewater treatment upgrades, required to accommodate the increased workforce during the overhauls, was higher than anticipated due the original design not meeting environmental limits. Final In-service date deferred 26 months from August 2014.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 301.7	$ 2.2	$ -	$ -	$ -	$ -	$ -
Increase (Decrease)	39.0	11.9	9.1	12.9	1.3	-	-
Revised Forecast	$ 340.4	$ 14.1	$ 9.1	$ 12.9	$ 1.3	$ -	$ -

Kettle Improvements & Upgrades

Description:
Rewind stator for units 5-12 and install a new stator frame, core and winding for units 1-4. Perform rotor refurbishment, thrust runner replacement, new excitation transformers, rebabbitting of bearings, excitation upgrade replacements, control and protection system replacements, mechanical systems replacements, and intake gate and wicket gate work for units 1-4.

Justification:
The stator windings at Kettle are polyester bonded mica which is prone to internal degradation as a result of thermal and electrical stresses. There has been a much higher failure rate for stator coils at Kettle than in any of our other generators installed since 1960. Analysis of the internal conditions of the insulation system is ongoing. Re-wedging units at Kettle is an opportunity to repair isolated cases of severe slot discharge, necessary to avoid deterioration. Unit 4 requires repairs due to an incident that occurred in August 2006, where a top clamping finger on the unit broke off and fell into the air gap causing extensive damage to the windings and core.

In-Service Date:
March 2026

Revision:
To reflect final costs for Unit 4, including scope increase for thrust runner replacement, new excitation transformer, re-babbiting of bearings and removal and disposal of the old stator for units 1-4.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 165.7	$ 7.7	$ 23.7	$ 17.3	$ 1.0	$ 31.7	$ 29.5
Increase (Decrease)	25.9	(1.1)	(0.2)	7.3	21.0	-	(0.0)
Revised Forecast	$ 191.6	$ 6.6	$ 23.5	$ 24.6	$ 22.0	$ 31.7	$ 29.5

Pointe du Bois Spillway Replacement

Description:
Design and build a new spillway and new concrete and earth fill dams to replace the existing spillway structures. Includes engineering and environmental studies, community consultation, obtaining regulatory approval, and de-commissioning the existing spillway.

Justification:
Pointe du Bois does not currently meet dam safety guidelines with respect to spillway capacity. A new spillway is required to meet these guidelines.

In-Service Date:
October 2015

Revision:
Deferred spillway in-service due to a late start to concrete placement, lower than planned productivity pushing concrete work into winter months and increased gate installation time. In addition to the delay in the spillway in-service, dam placement activities were suspended due to the late spring melt and higher than average precipitation flows on the Winnipeg River. As a result, final in-service date deferred one year from October 2014.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 559.6	$ 125.3	$ 5.5	$ -	$ -	$ -	$ -
Increase (Decrease)	15.0	(11.2)	46.1	3.8	-	-	-
Revised Forecast	$ 574.8	$ 114.1	$ 51.6	$ 3.8	$ -	$ -	$ -

Pointe du Bois - Transmission

Description:
Redevelop Stafford Terminal station (formerly Scotland station), replace Bank 7 at Pointe du Bois switchyard station, salvage 66kV P lines between Pointe du Bois and Rover stations, install a 115kV transmission line between Pointe du Bois and Whiteshell stations, add Bank 8 to Pointe du Bois switchyard, install a 66kV line between Ridgeway and Rover stations, and upgrade protection at Slave Falls switchyard station.

Justification:
The 66kV lines P1, P2, P3, and P4 between Pointe du Bois and Rover stations have exceeded their expected serviceable life and pose threats to public and employee safety. The reliability of the transmission system in the Winnipeg Central area has been degraded due to the poor physical condition of these lines. In order to successfully operate the power system and continuously deliver high quality power to our customers and protect the public, the P Lines should be removed. The rebuild of Stafford station is required to address due diligence concerns, including Manitoba Hydro grounding and switching standards and public safety, and to increase Winnipeg Central capacity. This work involves converting the 138kV system to 115kV, so work at Pointe du Bois is also required.

In-Service Date:
December 2017

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 114.3	$ 8.6	$ 12.3	$ 21.9	$ 7.4	$ -	$ -
Increase (Decrease)	-	7.2	4.8	(8.2)	(3.1)	-	-
Revised Forecast	$ 114.3	$ 15.8	$ 17.1	$ 13.8	$ 4.3	$ -	$ -

Gillam Redevelopment and Expansion Program (GREP)

Description:
Redevelop and expand the Town of Gillam infrastructure in Phases 1B, 2 and 3. Phases 2 & 3 will require further definition based on conceptual design and the requirement of Manitoba Hydro's construction of new facilities in the North.

Justification:
Redevelopment of the Town of Gillam is required to address existing operational needs and to prepare for the growth associated with new generation facilities. The GREP will improve the overall quality of infrastructure in Gillam, which will positively affect attraction and retention for existing and new generation facilities. The GREP supports Corporate initiatives to develop the hydroelectric potential of the Lower Nelson River.

In-Service Date:
March 2027

Revision:
A re-evaluation of the project resulted in cost reductions due to optimization of the project through a redesign of the town centre, residential site development, trailer park and industrial park as well as a re-analysis of customer requirements resulting in a reduction in scope of work.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 366.5	$ 27.0	$ 30.2	$ 30.5	$ 29.5	$ 27.9	$ 221.3
Increase (Decrease)	(100.0)	(7.0)	(7.8)	(7.8)	(7.8)	(7.7)	(62.0)

Bipole III - Transmission Line

Description:
Design and build a +/- 500kV HVdc transmission line of approximately 1 341km (west of Lakes Winnipegosis & Manitoba) from Riel Converter Station to Keewatinohk Converter Station. Conduct environmental impact assessment, acquire property, and obtain licensing necessary for a +/- 500kV DC transmission line and converter stations at Riel and Keewatinohk.

Justification:
Provides increased reliability to the Manitoba Hydro system due to the critical risk to the Province and the Corporation of not mitigating an Interlake (Bipole 1 and 2) corridor outage or a Dorsey station common mode outage. In normal steady state operation, it will also provide an increase in southern power, due to decreased line losses (approximately 76MW under full existing generation). The rating for Bipole III was increased from 2000MW to 2300MW to ensure adequate spare HVdc transmission on the northern collector system. The increased rating ensures future generation can be transmitted via Bipole I, Bipole II and Bipole III in the event of a single valve group outage.

In-Service Date:
July 2018

Revision:
The revised estimate incorporates a more detailed scope based on an issued environment act licence, approved finalized route and right-of-way width, as well as up-to-date market information. The project licence and permits were received later than planned, resulting in 1.5 lost winter seasons of 5 total planned. The estimate is based on the need for at least 4 more winter seasons to construct the transmission line. Project in-service date deferred nine months from October 2017.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 1 259.9	$ 265.9	$ 381.9	$ 263.7	$ 195.2	$ -	$ -
Increase (Decrease)	395.5	(62.4)	(21.5)	117.3	298.6	75.3	-
Revised Forecast	$ 1 655.4	$ 203.5	$ 360.5	$ 381.0	$ 493.8	$ 75.3	$ -

Bipole III - Converter Stations

Description:
Design and build an HVdc converter station with a rating of 2300MW at the proposed Keewatinohk (Keewatinoow) site, including property acquisition costs and the Keewatinohk 230kV AC switch yard. Design and build an HVdc converter station with 2300MW of converters at Riel, including four LCC HVdc synchronous condensers, property acquisition costs and expansion of the Riel 230kV AC switch yard.

Justification:
Provides increased reliability to the Manitoba Hydro system due to the critical risk to the Province and the Corporation of not mitigating an Interlake (Bipole I and II) corridor outage or a Dorsey station common mode outage. The rating for Bipole III was increased from 2000MW to 2300MW to ensure adequate spare HVdc transmission on the northern collector system. The increased rating ensures future generation can be transmitted via Bipole I, Bipole II and Bipole III in the event of a single valve group outage.

In-Service Date:
July 2018

Revision:
The selection of LCC technology has resulted in synchronous condensers being included in the revised estimate. Additionally, the awarded contract prices for the Keewatinohk Camp, Keewatinohk Site Development and the Keewatinohk 230kV AC Switchyard have been incorporated into the revised estimate. The rating for Bipole III was increased from 2000MW to 2300MW to ensure adequate spare HVdc transmission on the northern collector system. Project in-service date deferred nine months from October 2017.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 1 828.5	$ 262.6	$ 493.2	$ 410.2	$ 181.5	$ 127.4	$ -
Increase (Decrease)	846.6	(41.6)	87.6	418.5	326.1	67.7	23.0

Bipole III - Collector Lines

Description:
Design and construct three permanent and two temporary 230kV collector lines for the Keewatinohk Converter Station. Construct power substation for the Keewatinohk Converter Station, 138 kV line, microwave tower, and distribution feeders for the Keewatinohk Converter Station. Design and construct the Riel and Keewatinohk electrode lines, sectionalize the 230kV transmission line R49R at Riel. Includes the property acquisition and/or easements for the collector lines and the electrode lines. Design and construct a new bay and modify existing Long Spruce 230 KY AC switchyard for the new collector line to Keewatinohk Converter Station. Design and construction of a new bay and modifications at existing Henday 230 KY AC switchyard for the four new collector lines to Keewatinohk Converter Station. Design and construction of breaker replacements at existing stations (Ridgeway, Rosser, and McPhillips) for Bipole III.

Justification:
Provides increased reliability to the Manitoba Hydro system due to the critical risk to the Province and the Corporation of not mitigating an Interlake (Bipole 1 and 2) corridor outage or a Dorsey station common mode outage.

In-Service Date:
July 2018

Revision:
The revised estimate incorporates a more detailed scope including double circuit for one collector line, increased reliability design for electrode lines, updated assumptions for direct negotiated clearing and construction contracts based on an issued environment act licence and increased scope for Long Spruce and Henday switchyard additions and breaker replacements at existing stations. Project in-service date deferred nine months from October 2017.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 191.4	$ 63.5	$ 46.2	$ 37.7	$ 8.5	$ -	$ -
Increase (Decrease)	69.0	(5.0)	29.4	14.0	28.2	4.7	-
Revised Forecast	$ 260.2	$ 58.4	$ 75.5	$ 51.7	$ 36.7	$ 4.7	$ -

Bipole III - Community Development Initiative

Description:
Establishment of an obligation for a Community Development Initiative to provide benefits to First Nations, Community Councils, rural Municipalities and incorporated Towns and Villages within the vicinity of the Bipole III Project.

Justification:
Manitoba Hydro is responding to community feedback seeking longer term benefits for communities in proximity to high voltage transmission facilities. These funds will be available for community development projects that benefit a broad segment of eligible communities.

In-Service Date:
July 2018

Revision:
Net Present Value calculation increased due to the nine month in-service deferral from October 2017.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 60.8	$ 2.2	$ 2.0	$ 1.8	$ 0.9	$ -	$ -

Revised Forecast	$ 62.0	$ 2.3	$ 2.0	$ 1.8	$ 1.6	$ 0.5	$ -

Riel 230/500kV Station

Description:
Conduct environmental impact assessment and obtain licensing necessary for the Riel 230/500kV station. Design and construct a 230/500kV station at the Riel site including the installation of a 230kV bus with a maximum of five Bays, the installation of a 500kV ring bus, the installation of a 230/500kV 1200MVA transformer bank using two 230kV and one 500kV breaker, and the installation of 500kV line reactors with relocating of a reactor phase from Dorsey. Install a second reactor phase from Dorsey as a spare at Riel after the Riel reactors are in-service and salvage the third reactor phase at Dorsey. Sectionalize two 230kV transmission lines R32V and R33V into Riel station using eight 230kV breakers and associated equipment resulting in two Riel-Ridgeway and two Riel-St. Vital transmission lines. Sectionalize 500kV transmission line D602F into Riel station using two 500kV breakers and associated equipment resulting in Dorsey-Riel and Riel-Forbes 500kV circuits.

Justification:
The sectionalization of the 500kV line allows power to be imported during a catastrophic Dorsey outage, as well as an alternate path for power export during a Dorsey transformer outage.

In-Service Date:
October 2014

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34

Increase (Decrease)	-	(4.4)	4.9	-	-	-	-
Revised Forecast	$ 329.9	$ 36.4	$ 5.6	$ -	$ -	$ -	$ -

Manitoba-Minnesota New 500kV Transmission Line

Description:
Design, construct and commission a 235km 500kV AC single-circuit transmission line from Dorsey Station to the US border. Design and install one 500kV breaker, one 150MVAr 500kV shunt reactor, one double-wye ungrounded 46kV 73.4MVAr shunt capacitor bank and associated communications and protection at Dorsey. Design and install two 500kV breakers, one 230kV breaker, two double-wye ungrounded 46kV 73.4MVAr shunt capacitor banks, a 1 200MVA 230/500kV autotransformer and associated communications and protection at Riel. Acquire property for right-of-way, conduct environmental impact assessment, conduct community consultations, obtain licensing and perform environmental monitoring for all new facilities. Design, procure and install a new 300MVA phase shifter at Glenboro Station and re-align the transmission lines at the Glenboro Station to accommodate the new transformer.

Justification:
Power sale term sheets have been negotiated with Minnesota Power (250MW) and Wisconsin Public Service (300MW). The existing tie line capacity is insufficient to accommodate the additional sales and therefore a new export line is needed. The proposed transmission facilities will increase the Manitoba to U.S. transfer capability for both export and import purposes.

In-Service Date:
May 2020

Revision:
Cost flow revision and in-service date deferred seven months from October 2019.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 350.3	$ 3.8	$ 29.7	$ 101.1	$ 58.7	$ 63.5	$ 91.8
Increase (Decrease)	-	3.2	3.0	(1.5)	0.7	2.2	(8.3)
Revised Forecast	$ 350.3	$ 7.0	$ 32.7	$ 99.6	$ 59.5	$ 65.7	$ 83.5

Firm Import Upgrades

Description:
Reconductor and resag transmission lines SC25, WT34, and SM26, and replace risers and/or current transformers for stations at Whiteshell, Ridgeway, Transcona, and Parkdale.

Justification:
This project will increase to 100MW Manitoba Hydro's firm import capability from Ontario. Increasing the transmission capability will permit greater volume of energy imports during periods when additional energy may be required.

In-Service Date:
Cancelled.

Revision:
Project cancelled. Since the project was initially approved in 2008 and additional funding approved in 2011, market and corporate conditions have changed, and this import upgrade is no longer a priority considering the capital needs for major projects which must be undertaken. This project is not required for reliability or safety, and its cancellation will not negatively impact financial projections.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 19.9	$ 10.8	$ 8.9	$ -	$ -	$ -	$ -
Increase (Decrease)	(19.9)	(10.8)	(8.9)	-	-	-	-
Revised Forecast	$ -	$ -	$ -	$ -	$ -	$ -	$ -

Demand Side Management

Description:
Design, implement and deliver incentive based PowerSmart conservation programs to reduce electricity consumption in Manitoba.

Justification:
The electric Demand Side Management plan is cost effective as a resource option and is included in Manitoba Hydro's Power Resource Plan (PRP). The DSM plan provides customers with exceptional value through the implementation of cost-effective energy conservation programs that are designed to minimize the total cost of energy services to customers, position the Corporation as a national leader in implementing cost-effective energy conservation and alternative energy programs, protect the environment and promote sustainable energy supply and service.

In-Service Date:
Ongoing.

Revision:
Revisions to energy saving and expenditures for a number of programs to reflect current market information and designed to aggressively pursue cost-effective market-achievable savings. It is assumed that upon adoption of IFRS in 2015/16, the demand side management programs will continue to be capitalized, under the interim standard that continues to permit rate-regulated accounting.

MAJOR CAPITAL:

GENERATION OPERATIONS:

Pine Falls Units 1-4 Major Overhauls

Description:
Rehabilitation, replacement of and addition to various equipment such as generator re-wind, stator radial keys, breakers, cooling radiators, instrument transformers, unit control & monitoring systems, excitation system upgrades, governor upgrades, meter upgrades, and powerhouse crane refurbishment. Replace unit 1-4 turbine runners with more efficient new design runners, rebuild existing servomotors for increased wicket gate opening allowing more discharge, and rewind the generator stators utilizing modern insulating materials. Conduct a model test and up-rate study.

Justification:
Assessment of the mechanical systems has identified concerns in terms of obsolete equipment, safety, fire risk and adaptability to present day operating conditions and standards. Upgrading is necessary to ensure reliable safe and economical operation. Pine Falls consistently spills more water than the other Winnipeg River plants. Additional generation can be obtained (approximately 17%) with increased discharge capability. Tests have confirmed that the two stator windings are in danger of failure at any time.

In-Service Date:
September 2019

Revision:
Cost flow revision and in-service date deferred five months from April 2019.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 142.2	$ 8.0	$ 5.0	$ 21.9	$ 30.2	$ 27.0	$ 16.0
Increase (Decrease)	-	(0.8)	(4.3)	(7.9)	(3.8)	2.6	24.9
Revised Forecast	$ 142.2	$ 7.2	$ 0.7	$ 14.0	$ 26.4	$ 29.6	$ 40.9

Jenpeg Overhaul Program

Description:
Major overhaul of all six generating units to inspect, repair, modify, and replace components of the turbine/ generator. Areas of concern include journal bearings, thrust bearings, turbine seals, servo motors, wicket gate seals and bushings, waterhead and oil head, stator and rotor, and auxiliary systems.

Justification:
A complete overhaul is required to ensure reliable operation of the units when maximum power requirements on the system are essential.

In-Service Date:
December 2031.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 115.9	$ -	$ -	$ -	$ -	$ -	$ 115.9
Increase (Decrease)	-	-	-	-	-	-	-
Revised Forecast	$ 115.9	$ -	$ -	$ -	$ -	$ -	$ 115.9

Slave Falls Major Overhauls

Description:
Perform major overhaul for all eight units at Slave Falls generating station, including spillway improvements/ replacements, excitation upgrades, the addition of a Unit Control and Monitoring System (UCMS) Framework, access road upgrades, and a new walkway across the spillway.

Justification:
Many safety, reliability, environmental, efficiency, operational & dam safety issues have been identified relating to the Slave Falls infrastructure. Extensive repairs, modifications and/or replacements will be required to ensure the serviceability of the plant and spillway infrastructure. Economics of this work may suggest that a new spillway be constructed to replace existing spill infrastructure. Current operating procedures include ice load reduction activites at the spilling structures to ensure structural stability. A dam safety concern has been identified with respect to the minimal remote spilling capability at Slave Falls.

In-Service Date:
September 2027.

Revision:
In-service date deferred six years from September 2021.

	Total	2015	2016	2017	2018	2019	2020-34

Increase (Decrease)	-	(0.2)	(0.9)	(5.3)	(26.6)	(30.3)	63.3
Revised Forecast	$ 126.1	$ -	$ -	$ -	$ -	$ -	$ 126.1

Water Licenses & Renewals

Description:
Conduct hydraulic studies, geotechnical assessments, property status and severance line determinations, mapping, license documentation, environmental reviews, and community informational sessions necessary to secure license finalization and/or renewals for the Corporation's hydraulic plants.

Justification:
All hydraulic generating facilities must be authorized under water power licenses and these licenses need to be clearly in force to significantly reduce risk exposure, maintain operating flexibility, maximize export revenues, and contribute to financial strength.

In-Service Date:
Various

Revision:
This item is made up of numerous License Finalizations, Renewals and other programs included to proactively protect the environment and contribute to the corporation's sustainable development principles. It is considered an on-going program cost therefore the budget is now included in Generation Operations Base Target.

	Total	2015	2016	2017	2018	2019	2020-34

Increase (Decrease)	NA	(7.0)	(7.0)	(6.5)	(2.4)	-	-
Revised Forecast	$ -	$ -	$ -	$ -	$ -	$ -	$ -

Pointe du Bois GS Rehabilitation

Description:
Implement safety upgrades for the Pointe du Bois generating station including fire protection, mechanical hazards, electrical hazards, operational hazards, trips and fall hazards, and various other safety upgrades. Additionally, implement turbine and generator, equipment and civil rehabilitation and upgrades.

Justification:
To provide a high level of health and safety upgrades as well as improved reliability and control, along with a reduction in potential environmental impacts from catastrophic events such as fire or flooding. The plan provides the most economical solution to operate the generating station for an additional twenty years.

In-Service Date:
March 2021

Revision:
Cost flow revision and advanced in-service date five years and four months from July 2026.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 182.9	$ 10.3	$ 15.3	$ 21.7	$ 19.5	$ 20.4	$ 81.5
Increase (Decrease)	-	(0.2)	0.1	25.3	30.5	4.8	(60.5)
Revised Forecast	$ 182.9	$ 10.1	$ 15.4	$ 47.0	$ 50.0	$ 25.2	$ 21.0

Great Falls Unit 4 Overhaul

Description:
Major overhaul to generating Unit 4 including generator rewind, turbine re-runnering, new water passage embedded components, one 3-phase unit transformer, and modernization of components.

Justification:
The re-runnering and major overhaul will provide an opportunity to upgrade/modernize the unit while taking advantage of an already planned outage for the intake gates. The re-runnering will add both capacity and efficiency. The existing transformer is in poor condition and water passage components are starting to fail. The overhaul will increase reliability and extend the asset life by 40 to 50 years.

In-Service Date:
August 2015.

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 53.6	$ 16.5	$ 11.9	$ -	$ -	$ -	$ -

Brandon Units 6 & 7 "C" Overhaul Program

Description:
Perform C inspections/overhauls of the Brandon gas turbines Unit 6 & 7 when each of them acquires 24,000 Equivalent Operating Hours (EOH).

Justification:
The reliability of the hot gas path components cannot be predicted after 24,000 EOH. Failure of hot gas path parts could lead to significant collateral damage and an extended forced outage of the units.

In-Service Date:
March 2024.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 50.4	$ -	$ -	$ -	$ -	$ -	$ 50.4
Increase (Decrease)	-	-	-	-	-	-	-
Revised Forecast	$ 50.4	$ -	$ -	$ -	$ -	$ -	$ 50.4

TRANSMISSION:

Rockwood East 230/115kV Station

Description:
Design and construct a new 230/115kV Rockwood East Station adjacent to 230kV circuits A3R (Ashern-Rosser) and S65R (Silver-Rosser) including associated equipment, protection, control and communication systems. Sectionalize and extend 230kV and 115kV transmission lines as required and provide communication and protection upgrades.

Justification:
Construction of the Rockwood East Station with three 115kV line terminations would alleviate the overload scenarios for Rosser 230/115kV Banks 2 and 4 and for 115kV circuits CR4 or CR2 between Rosser and Parkdale Stations. It would also increase the 115kV capacity in the Rosser/Parkdale/Selkirk area. The existing Parkdale 115/66kV Station switchyard has very limited opportunity for adding new capacity due to the station's poor condition and limited space.

In-Service Date:
November 2015.

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 53.3	$ 29.1	$ 8.6	$ -	$ -	$ -	$ -
Increase (Decrease)	-	(2.5)	2.5	-	-	-	-
Revised Forecast	$ 53.3	$ 26.6	$ 11.1	$ -	$ -	$ -	$ -

Lake Winnipeg East System Improvements

Description:
Build a new 115/66kV Manigotagan Corner Station complete with two 6OMVA transformers, a new 65km, 115kV transmission line from Pine Falls Station to Manigotagan Corner Station and the associated terminations and communications.

Justification:
Pine Falls Station currently operates over firm transformation during winter peak. The absence of firm transformation would cause customer outages in the Lake Winnipeg East area during a Pine Falls transformer outage. The outage would last greater than a week until a spare transformer could be brought in from Winnipeg and connected. A transformer outage would affect more than 1,300 permanent customers and more than 13,000 seasonal (summer) customers. Deferral will place customers at risk of no supply. The new 115/66kV Manigotagan Corner Station and Pine Falls – Manigotagan Corner 115kV Transmission Line will provide firm capacity for area load for the next 20 years, as well as enable the Bloodvein SVC to control effectively the voltage at Bloodvein, Little Grand Rapids, Beren's River and Poplar River for the next 20 years. It also reduces the loading on Pine Falls 115/66kV Station, thereby accommodating load growth in the Victoria Beach, Grand Beach and Bissett areas.

In-Service Date:
October 2016

Revision:
Cost flow revision and in-service date deferred eleven months from November 2015.

	Total	2015	2016	2017	2018	2019	2020-34

Letellier - St. Vital 230kV Transmission

Description:
Design and construct a new 230kV line from Letellier Station to St. Vital Station including associated terminations and communications. Includes environmental licensing and monitoring, and property rights acquisition.

Justification:
The supply to Letellier Station must be improved in order to overcome the contingency loading and low voltage problems in the south central area of Manitoba caused by load growth, as well as to maintain export levels on the 230kV Tie Line L20D (Letellier to Drayton) at these increased loads.

In-Service Date:
July 2017

Revision:
Cost flow revision and an eleven month deferral from August 2016.

	Total	2015	2016	2017	2018	2019	2020-34

Transmission Line Upgrades for NERC Alert

Description:
This project consists of a nine year program to upgrade over 1000 transmission line spans to meet CSA Standards for line clearance. A priority listing of the transmission lines and spans requiring mitigation will be developed based on assessment work considering operational and safety risks specific to each line/span.

Justification:
This program addresses discrepancies between the design ratings and actual field ratings of transmission lines thereby ensuring continued reliability and operation of the electrical system as well as mitigating risks to public safety due to insufficient line clearance.

In-Service Date:
March 2023.

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 151.3	$ 1.1	$ 8.9	$ 9.0	$ 9.1	$ 23.7	$ 99.5
Increase (Decrease)	-	(0.1)	(0.2)	(0.2)	(0.2)	(0.4)	1.1
Revised Forecast	$ 151.3	$ 1.0	$ 8.6	$ 8.8	$ 8.9	$ 23.3	$ 100.6

HVDC Dorsey Synchronous Condenser Refurbishment

Description:
For all nine (9) Synchronous Condensers at Dorsey, project includes major mechanical refurbishment consisting of re-wedging the stator, refurishment of bearings, rotor, and poles, and replacement of protection and control cubicles, Motor Control Center (MCC), excitation system and cables. Other work includes replacing the H2/CO2 ventilation and detection systems (except SC9Y), vibration monitoring, pony motor brushgear, and liquid mixing valves.

Justification:
Synchronous condensers are required for proper operation of the HVDC system, voltage regulation of the southern AC system and to provide reactive power for power export to the United States. A major inspection and overhaul of each machine is necessary to prevent catastrophic failure, involving the rotors and rotor bolts as indicated by the failures of SC12Y in 1987 and SC11Y in 1988. The cost of repairing a failure when combined with the inability to export power will well exceed the cost of major inspection and overhaul.

In-Service Date:
October 2021.

Revision:
Cost flow revision and in-service date deferred two years from October 2019.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 73.3	$ 7.9	$ 8.9	$ 8.5	$ 5.9	$ 3.4	$ 0.8
Increase (Decrease)	-	0.8	(0.4)	(5.8)	(0.7)	(1.2)	6.6
Revised Forecast	$ 73.3	$ 8.7	$ 8.5	$ 2.7	$ 5.2	$ 2.2	$ 7.3

Dorsey 230kV Phase II Zone Building

Description:
Construction and equipping of two new zone buildings and refurbishing of the existing relay building and equipment. This project also includes installing and replacing various pieces of equipment and modifications to the switchyard.

Justification:
Construction of two new hardened relay buildings plus the hardening and conversion of the existing relay building is the most cost effective and practical option. This approach segregates the 230kV switchyard into three sections, providing for the majority of the 230kV switchyard to remain operational following the loss of a zone building. This meets Manitoba Hydro’s system restoration criteria.

In-Service Date:
Cancelled

Revision:
Item cancelled. The Phase I improvements to Dorsey’s 230kV Relay Building have significantly reduced the risk of catastrophic failure caused by severe weather and/or fire. The building has been fortified to withstand an F3 category tornado and the implemented fire mitigation measures have reduced the probability of a major fire with the Relay Building by greater than 200 times. These enhancements combined with the future addition of Bipole III have reduced the risks sufficiently to eliminate the need for Phase II.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	NA	$ -	$ -	$ 0.4	$ 16.5	$ 33.2	$ 13.3
Increase (Decrease)	-	-	-	(0.4)	(16.5)	(33.2)	(13.3)
Revised Forecast	NA	$ -	$ -	$ -	$ -	$ -	$ -

Bipole 2 Thyristor Valve Replacement

Description:
Removal of the existing eight (8) thyristor valve groups and their controls, and replace them with eight new de-ionized water cooled HVDC thyristor valve groups and controls.

Justification:
The Bipole 2 thyristor valves and controls are nearing the end of their useful life and require replacement. Replacing the existing thyristor valve groups and controls with new ones will result in reducing the probability of forced outages. This will result in a significant decrease in failures, reduce maintenance requirements, and generally improved reliability for Bipole 2.

In-Service Date:
October 2023

Revision:
Cost flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 233.7	$ -	$ -	$ -	$ 2.1	$ 13.3	$ 218.3
Increase (Decrease)	-	-	-	-	-	(0.1)	0.1
Revised Forecast	$ 233.7	$ -	$ -	$ -	$ 2.1	$ 13.2	$ 218.4

CUSTOMER SERVICE & DISTRIBUTION:

New Madison Station - 115/24kV Station

Description:
Build a new 115/24kV St. James Station, new and upgraded feeders, and conversion of St. James, Ness, Berry and King Edward station feeders from 4kV to 24kV. Install 1.5km of new 115kV cable from St. James Station and protection upgrades required at Rosser, Inkster Sherbrook, Mohawk and La Verendrye stations.

Justification:
This project is required to ensure firm supply and a reliable system in the St. James area.

In-Service Date:
March 2017.

Revision:
The installation of 1.5km of 115kV cable from St. James Station to Madison Station is now required because tapping off existing infrastructure in the area is not viable. The contract bid price for the construction of the station and the internal labour to support the contract was higher than previously estimated. The protection upgrades at other stations was not included in previous estimates. The multi in-service date is deferred by twelve months to March 2017 without changing the Madison Station in-service date of March 2016.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 69.6	$ 20.0	$ 25.6	$ 16.1	$ 1.3	$ -	$ -

Revised Forecast	$ 87.1	$ 32.6	$ 33.6	$ 12.8	$ -	$ -	$ -

St. Vital Station - 115/24kV Station

Description:
Install a 3-bank 115/24kV station complete with nine feeder positions and protection to replace the existing 24kV distribution at St. Vital Station.

Justification:
The project addresses the equipment rating concerns currently mitigated by station operating restrictions and customer-driven demand for electricity in the area, as well as restoring reliable station contingency plans.

In-Service Date:
December 2018.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 51.3	$ 0.3	$ 3.0	$ 20.0	$ 20.0	$ 7.9	$ -

Revised Forecast	$ 51.3	$ 0.3	$ 3.0	$ 20.0	$ 20.0	$ 7.9	$ -

Dawson Road Station - 115/24kV Station

Description:
Install a 2-bank 115kV/24kV station complete with six feeder positions and two capacitor banks to replace existing 24kV distribution equipment at Dawson Road Station.

Justification:
Justification is based on fulfilling customer-driven demand for electricity in the area as well as providing a reliable supply to customers in contingency situations.

In-Service Date:
December 2019.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 51.8	$ 2.5	$ 0.5	$ 3.0	$ 16.5	$ 20.0	$ 9.3
Increase (Decrease)	-	-	-	-	-	-	-

Burrows New 66/12kV Station

Description:
Build a new two bank 66kV/12kV indoor station, complete with 12 feeder positions and protection to replace the Alfred and Charles stations.

Justification:
Most of the equipment in this part of Winnipeg has been in service for 77 years. Alfred Station (which supplies Charles Station) lacks access to a satisfactory alternate supply in the event of a 12kV interruption out of Rover Station. Remedial action was recommended for both stations in the Due Diligence Report. It indicated the 4kV switchgear lineups at Alfred and Charles Stations lack arc-resistance and at Alfred Station are sometimes underrated for the available fault current during normal operating conditions. It also had concerns that neither station has an appropriate battery room, all station transformers have patched leaks, they contain asbestos materials, and that spare parts are in short supply.

In-Service Date:
March 2015.

Revision:
Cash flow revision only.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	$ 54.7	$ 5.1	$ -	$ -	$ -	$ -	$ -
Increase (Decrease)	-	(2.7)	-	-	-	-	-
Revised Forecast	$ 54.7	$ 2.4	$ -	$ -	$ -	$ -	$ -

New Adelaide Station 66/12kV

Description:
Construct a new Adelaide Station with 3 x 66-12kV, 30 MVA transformers and three line-ups of switchgear for twenty-three feeder positions. Install a control building for 12kV switchgear, communication, control and protection equipment. Install a 66kV GIS building/equipment for station supply terminations. Install 2 x 3km lengths of 66kV cable through new ductline to extend 66 kV line W6 to terminate at new station. Install new distribution ductline egresses from new station to connect to existing ductline system in downtown area.

Justification:
Constructing the new Adelaide Station will allow for the decommissioning of King Station, addressing all concerns with safety and aging infrastructure at King Station. Adelaide Station also provides sufficient area capacity to allow the proposed William Station project to be deferred. Five feeders from the new Adelaide Station will be expressed through new ductline towards the Health Science Centre (HSC) to aid Sherbrook Station in supplying that area. Sherbrook Station does not have capacity to continue to handle load growth around the HSC Complex by itself.

In-Service Date:
October 2023

Revision:
New item.

BASE CAPITAL:

ELECTRIC OPERATIONS:

Generation Operations

Description:
These projects are required to provide safe, reliable, efficient supply of power, and to replace plant facilities which are at the end of their useful life. This is comprised of:

GENERATION – Projects relating to upgrading or replacing infrastructure, controls, transformers, breakers, and other equipment at existing generating stations.

GENERATION TOWN SITE SERVICES - Projects required to maintain facilities and provide services to town sites such as Gillam, Grand Rapids and Seven Sisters.

OTHER CAPITAL - Projects relating to upgrading replacing or enhancing domestic water and waste water systems, security systems, office, plant and field equipment replacements; communications; tools and test equipment as well as water licenses & renewals.

Justification:
The generation availability of the older assets has been declining over the last ten years. As Generation Operation's assets age, there is an increase in risk to their availability, which could result in months or years of unit outages and significantly impact the ability to produce power to the transmission system. Enhancements or rehabilitation to the power supply facilities will ensure a safe, reliable and efficient source of energy.

Revision:
Combined Major and Base targets revised through to 2020/21 and escalated at 2% thereafter to consider increased requirements for aging infrastructure replacement based on asset condition assessments.

The tables below show the changes in Base Targets and Major & Base targets.

Generation Operations Base Target

Manitoba Hydro
Consolidated Capital Expenditure Forecast (CEF14)
For the Years 2014/15 – 2033/34

Transmission

Description:
The majority of projects consist of additions, improvements and replacement of transmission lines; replacement, development and upgrades to HVDC facilities; replacement, development and upgrades to communication systems; additions and replacement of field maintenance equipment; and station upgrades. This is comprised of:

SYSTEM RELIABILITY – Projects that address the reliability or capacity of the transmission, or communication systems, including system emergencies and regulatory compliance.

HVDC FACILITIES - Projects relating to upgrading or replacing transformers, breakers, smoothing reactors, protection, controls and other equipment at HVDC facilities.

CUSTOMER SERVICE - Projects that address new or existing service extensions to larger customers.

ENVIRONMENTAL - Projects that enhance or restore the environment, mitigate damage or potential damage to the environment or remove/salvage plant.

SAFETY – Projects that address risk to public or employee safety or emergency preparedness.

OTHER- Projects to acquire tools and equipment that support operation and maintenance of the electric system.

Justification:
This program ensures the reliability of transmission with respect to load, outages, and import/export requirements; as well as addresses safety issues and provides the necessary support for the operation of the HVDC, transmission and communication systems.

Revision:
Combined Major and Base targets revised through to 2020/21 and escalated at 2% thereafter to consider increased requirements for aging infrastructure replacement based on asset condition assessments.

The tables below show the changes in Base Targets and Major & Base targets.

Transmission Base Target

	Total	2015	2016	2017	2018	2019	2020-34

Customer Service & Distribution

Description:
These projects are required to extend sub-transmission, distribution, and transformation facilities to supply service to residential, farm, commercial and industrial customers, and to replace plant facilities whose useful life has been exceeded. Specific types of expenditures include station and line additions, modifications and rebuilds, bank additions, breaker replacements, defective cable replacement, highway changes, field maintenance equipment, woodpole replacements and ice melting requirements. These costs are spread over many facility locations throughout the Province and are comprised of:

SYSTEM IMPROVEMENTS - Projects relating to additions and modifications to the existing electric distribution network to maintain system reliability and standards of safety, as a result of customer load growth, aging infrastructure and operational standards of performance. Assets and facilities include distribution stations, poles, conductors, transformers, streetlights, cables, duct lines and manholes.

CUSTOMER SERVICE - Projects relating to new or existing service extensions to commercial and residential customers.

NEW STATIONS - Projects relating to station development requirements in both Winnipeg and rural Manitoba to address capacity limitations.

OTHER CAPITAL - Projects relating to VHF radio replacements and field maintenance equipment.

Justification:
The residential, farm, commercial and industrial loads are expected to grow at an average rate in excess of 1.5% per annum and will require a program of additions to the system to accommodate these anticipated loads. As the distribution assets are approaching the end of their designated lifespan a four year program has been established to replace critical infrastructure.

Revision:
Combined Major and Base targets revised through to 2020/21 and increased thereafter to consider increased requirements for aging infrastructure replacement based on asset condition assessments.

The tables below show the changes in Base Targets with and without Major Projects > $50M.

Customer Care & Energy Conservation

Description:
This program covers the additions and replacements of meters, transformers and related equipment and is comprised of:

CUSTOMER SERVICE – Projects that address service to a customer or customer-driven requests, including costs associated with new and replacement metering equipment, metering transformers and associated equipment.

OTHER– Projects to acquire tools and equipment that support operation and maintenance of the electric system.

Justification:
As required for the connection of new customers to the system, as well as replacement of existing time expired or faulty meters.

Revision:
Increase due to the addition of meter exchanges and sampling which will be reclassified from operating expenses to capital upon adoption of IFRS in 2015/16.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	NA	$ 3.1	$ 3.2	$ 3.3	$ 3.3	$ 3.4	$ 59.8

Revised Forecast	NA	$ 3.2	$ 4.0	$ 4.1	$ 4.1	$ 4.2	$ 61.5

Human Resources & Corporate Services

Description:
The program consists of information technology hardware and software upgrades and application development, corporate building refurbishments and new building programs, fleet vehicle refurbishment and replacement as well as projects associated with property easements, and acquisition of equipment for the training centre, print shop, fleet, materials management, and facilities.

CORPORATE BUILDINGS - Projects associated with the cyclical acquisition, and/or replacement of corporate administrative facilities throughout the Province.

FLEET ACQUISITIONS - Projects associated with the cyclical procurement, refurbishment and/or replacement of corporate fleet vehicles and equipment.

INFORMATION TECHNOLOGY HARDWARE / SOFTWARE - Projects associated with the purchase and installation of hardware and software upgrades, personal computers, networks and cabling.

INFORMATION APPLICATION DEVELOPMENT - Projects associated with installing, developing or upgrading computer applications for the corporation.

OTHER – Projects associated primarily with property easements and equipment for the training centre, print shop, fleet, materials management and facilities.

Justification:
To provide safe, efficient and productive; corporate buildings, fleet vehicles and equipment. Also to enhance computer systems throughout the corporation to achieve ongoing improvement in productivity and reliability.

Revision:
Base targets revised through to 2020/21 including new district office buildings and completion of Enterprise Asset Management project and escalated at 2% thereafter to consider increased requirements for aging infrastructure replacement.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	NA	$ 75.7	$ 54.8	$ 54.8	$ 34.4	$ 32.1	$ 638.7
Increase (Decrease)		(0.7)	20.2	0.2	20.6	22.9	294.9
Revised Forecast	NA	$ 75.0	$ 75.0	$ 55.0	$ 55.0	$ 55.0	$ 933.6

Finance & Regulatory

Description:
This program is primarily for meter purchases (for load research monitoring), and handheld devices associated with the load research function. Other items include the purchase of additional servers and other information technology related equipment and specialized software.

Justification:
The load research program supports the development of customer rates and also supports Power Smart initiatives in terms of planning and support.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34

GAS OPERATIONS:

Customer Service & Distribution

Description:
This program consists of projects required to extend, rebuild or upgrade: transmission pipelines, distribution pipelines, regulating stations, and customer service lines. This is comprised of:

SYSTEM IMPROVEMENTS – Projects relating to system modifications and betterment. Significant work includes capacity upgrades, system integrity upgrades, regulator station upgrades and cathodic protection upgrades.

NEW BUSINESS - Projects for installing new services and distribution mains for both commercial and residential customers.

Justification:
Required to provide ongoing safe and reliable supply of natural gas to customers.

Revision:
None.

	Total	2015	2016	2017	2018	2019	2020-34
Previously Approved	NA	$ 34.9	$ 49.0	$ 34.9	$ 22.3	$ 21.2	$ 501.7
Increase (Decrease)		-	-	-	-	-	-
Revised Forecast	NA	$ 34.9	$ 49.0	$ 34.9	$ 22.3	$ 21.2	$ 501.7

Customer Care & Energy Conservation

Description:
This program consists primarily of costs to design, implement and deliver incentive based PowerSmart conservation programs to reduce gas consumption and greenhouse gas emissions in Manitoba, as well as meters, transformers and related equipment. This is comprised of:

GAS DEMAND SIDE MANAGEMENT – Projects to design, implement and deliver incentive based PowerSmart conservation programs to reduce gas consumption and greenhouse gas emissions in Manitoba.

CUSTOMER SERVICE – Projects that address service to a customer or customer-driven requests, including costs associated with new and replacement metering equipment, metering transformers and associated equipment.

Justification:
The natural gas Demand Side Management plan provides customers with exceptional value through the implementation of cost-effective energy conservation programs that are designed to minimize the total cost of energy services to customers, position the Corporation as a national leader in implementing cost-effective energy conservation and alternative energy programs, protect the environment and promote sustainable energy supply and service. Also required for the connection of new customers to the system, as well as replacement of existing time expired or faulty meters.

Revision:
Revisions to energy saving and expenditures for a number of programs to reflect current market information and designed to aggressively pursue cost-effective market-achievable savings. It is assumed that upon adoption of IFRS in 2015/16, the demand side management programs will continue to be capitalized, under the interim standard that continues to permit rate-regulated accounting.

Manitoba Hydro
Electric Infrastructure Condition Assessment Summary

December 2014

Manitoba Hydro

1. Executive Summary

Manitoba Hydro is one of the largest integrated electricity and natural gas distribution utilities in Canada, serving over 555,000 customers across nearly 650,000 square kilometres. Meeting the needs of its customers requires a vast complex of diverse assets. Though assets are being continually maintained to extend asset life, a significant portion requires reinvestment over the next 20 years due to the current health and age of the assets.

This Electric Infrastructure Condition Assessment Summary report provides an overview of the most significant Manitoba Hydro generation, transmission, high voltage direct current (HVDC) and distribution assets. It consists of current asset conditions, demographics and a 20-year forecast of equipment condition based on current replacement rates and projected replacement or refurbishment work included in the Capital Expenditure Forecast 2013 (CEF13).

Some of these assets are in poorer condition than what is considered acceptable with ages well beyond industry standards and present a significant risk of failure while in-service. In-service failures generally represent a greater risk of customer outages and/or load shedding and are a potential hazard to individuals working in and around these assets as well as to public safety. Some of these assets, such as breakers, generators, wood poles and valve groups, also require significant effort, lead time and capital investment to address their present condition.

The 20-year outlook based on current replacement rates and the CEF13 current capital expenditure forecast indicates a trend toward less asset reliability as more assets slip into the very poor and poor condition categories. This trend is something that must be addressed with additional capital asset sustainment programs or an equivalent means to address this predicted scenario. The 20-year outlook indicates the following items are of most concern:

- Generators
- Generation breakers
- Generation governors
- HVDC smoothing reactors
- HVDC valve groups
- Transmission protection relays
- Distribution wood poles
- Distribution underground cables

Table of Contents

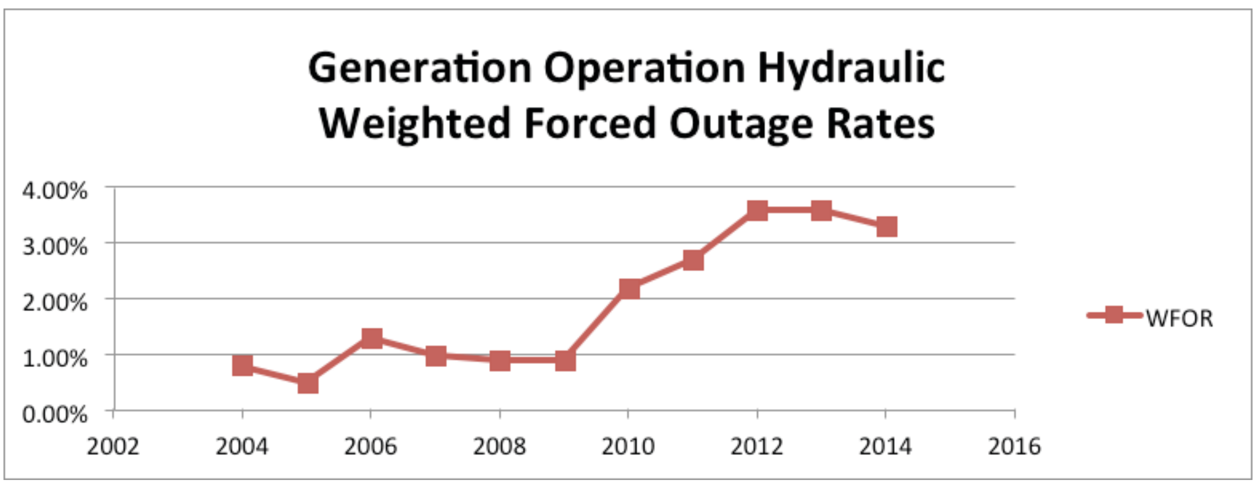
2. Introduction/Background

Manitoba Hydro owns and maintains several million assets throughout Manitoba. This complex electrical system has been developed in key stages over more than 100 years. The assets stretch to all corners of the province with some being in very remote locations without traditional road access.

A considerable amount of Manitoba Hydro's assets were installed prior to 1960 when many of the first generating stations and transmissions systems were built (1911-1950) and when a large portion of the province was electrified (1940-1960). Many of these assets have been well maintained or overhauled and are still in service, providing decades of valuable service to the corporation and its ratepayers. The next mass installation of assets was from 1960 through to 1990 when generating stations were developed on northern Manitoba river systems along with the supporting HVDC system to transport the electricity to customers in the south. Many of these assets are now at or near the end of their design lives and require replacement in the near future to maintain reliability.

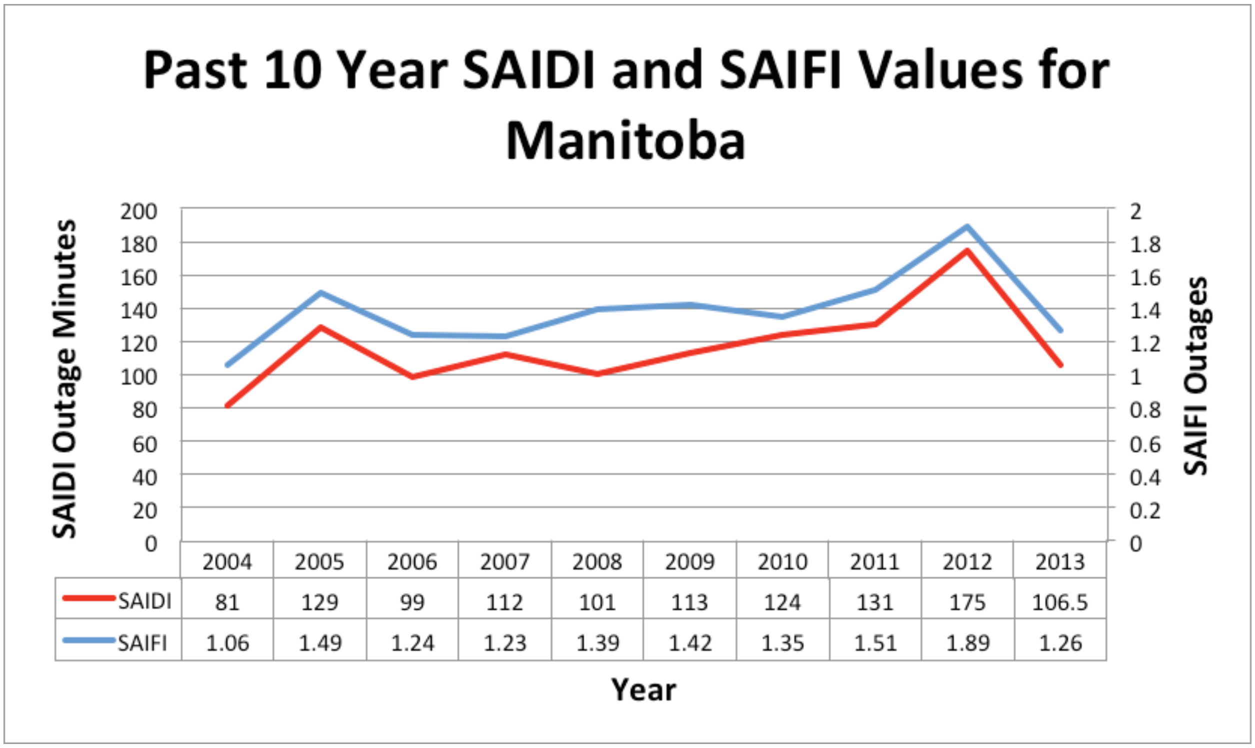
Manitoba Hydro reliability has historically been amongst the best in Canada. However, system reliability performance is beginning to degrade and asset condition is a contributing factor. The following charts are a few key reliability indicators that Manitoba Hydro uses to gauge infrastructure performance.

Generation forced outage rates indicate the amount of time that generation is unavailable due to equipment failures.



***The percentage of service hours that a generating unit is not available due to forced outages as a function of the MCR. MCR is the unit maximum continuous MW rating.**
Weighted Forced Outage Rate (WFOR) = Sum of all units ((Forced Outage Hours Per Unit * MCR Per Unit)) / Sum of all units ((Forced Outage Hours Per Unit + Operating Hours Per Unit) * MCR Per Unit))

SAIDI (System Average Interruption Duration Index) and SAIFI (System Average Interruption Frequency Index) values are used throughout the utility industry as a standard for comparison purposes across jurisdictions and is the average outage time and frequency that a customer would experience.



Equipment at the end of its life tends to experience increased failure rates. Many of Manitoba Hydro's assets have been in service since the original system developments. As a result, significant changes to current replacement rates will be required in the future to mitigate the negative impacts of aging infrastructure on our electrical system.

The original cost of these assets is approximately $15 billion with an estimated replacement value that would be many multiples higher due to inflation, increases in commodity prices and other factors. An asset portfolio of this size requires significant reinvestment to ensure that performance and safety standards are achieved.

Objectives of the Electric Asset Health Index Summary Report

This Electric Infrastructure Condition Assessment Summary presents a view of some of the major electrical asset conditions and their demographics. It was completed using industry accepted methodologies for each asset type presented. Asset condition is an important input into the risk management process and the prioritization of capital funding used to maintain a sustainable and reliable electric system for Manitoba.

The 20-year asset condition outlook based on the current capital expenditure forecast indicates a trend toward less asset reliability as more assets slip into the very poor and poor condition. This trend must be addressed with additional capital asset sustainment programs or an equivalent means to address this expected scenario.

3. Methodology

An Asset Health Index (AHI) quantifies equipment condition based on numerous condition parameters that are related to the long-term degradation factors that cumulatively lead to an asset's end of life. An AHI should provide a measure of long-term degradation, which is an indicator of the asset's overall health, and should reflect the likelihood that an asset will fail and necessitate a forced replacement or refurbishment. For some asset types, forced replacements can result in substantial costs and extended outages due to delays associated with procuring a replacement asset and with the engineering required to install the replacement (e.g. replacing older breaker or protection relay technologies with newer technologies). Therefore, the AHI provides an important input to the assessment of asset related risks.
Manitoba Hydro used available asset data (such as age, lab tests, equipment vibration and temperature, etc), maintenance and operating experience, and engineering assessments to calculate a condition index for each asset. Availability of various input parameters and data quality differed from asset to asset.

The asset health index methodologies:

- are used to calculate the various ratings for each asset to arrive at the "Asset Health Index" (AHI).
- provide a consistent means of evaluating the condition of individual assets,
- tracks and categorizes the health of a class of equipment,
- assists with asset decision making,
- facilitates planning for future maintenance, replacement and refurbishment.

Across the three business units (Generation Operations, Transmission and Customer Service & Distribution) there are similar asset types, such as breakers, poles, and batteries that are used for the same basic functions. Other asset types, like transformers, seem similar but are utilized in very different operating contexts by each business unit. As a result these assets have different maintenance requirements and life expectancies, and require somewhat different AHI methodologies.

Asset Health Index Summary Graphs

Asset Health Index (AHI) summary graphs show the summary of AHI results in a single picture. The asset class members for each condition rating are charted in colored bar percentages that extend across the grid. The final scoring breakdown provides consistent comparisons across all the various Manitoba Hydro assets.

Scoring breakdown

- **Very poor** = Beyond acceptable level of risk; Action is required over the short term. Asset should be replaced, refurbished or decommissioned soon (Condition Index 0 -1.49)
- **Poor** = Managing risk; Assets may require replacement (approaching or past expected end of life) (Condition Index 1.5- 3.49)
- **Fair** = Long term service without notable measures of degradation (still in its useful part of its life) (Condition Index 3.5 – 4.99)
- **Good** = Midterm service without notable measures of degradation (in the prime of its useful life) (Condition Index 5 – 8.49)
- **Very Good** = Like new operating at expected measure of performance (early in its life) (Condition Index 8.5 -10)

Some assets are replaced based on risk informed economic end of life assessments in conjunction with asset condition score.

4. Individual Asset Condition Assessment and Demographics by Business Unit

The following sections outline, by business unit, the details surrounding each individual asset so that the reader can relate to how the asset is used, how it will degrade, how long it is expected to be in service, and its age and condition demographics at the time this report was prepared.
Asset health indexes continually change based on new asset data as it become available over time and the findings in this report are based on the asset data available prior to reporting.

GENERATION OPERATIONS

Generation Operations is responsible for 15 hydroelectric generating stations and two small thermal generating stations with a total combined capacity of approximately 5400 MW.

Generators:

Description:		
A generator is a rotating electrical machine. It is used to convert the mechanical energy of a prime mover to electrical energy. Generators are the source of electrical energy for the bulk electric system. The majority of Manitoba Hydro's electricity is generated in northern Manitoba.		
Degradation: • Insulation break down • Thermal fatigue • Wear of moving parts	**Expected Life:** **(as defined in Appendix A)** 60 years	**Turnover based on Current Replacement Rate:** Approximately every 117 years

Hydraulic Turbines:

Description: A hydraulic turbine is a rotating device connected to an electrical generator. It is used to convert the potential energy of stored water to rotating mechanical energy. The expected life of a turbine is long due to the fact that there are many opportunities to refurbish and add years to the life of this asset.		
Degradation: • Cavitation • Wear of moving parts	**Expected Life:** 90-100 years	**Turnover based on Current Replacement Rate:** 84 years Assets are replaced due to end of life as well as economically justified increases to unit output.

Demographics

Exciters:

Description: An exciter is a device used to control the voltage output of an electrical generator. There are different types of exciters used in a utility environment. Older types are typically rotating exciters with many moving parts requiring additional maintenance but increased overall asset longevity compared to the new types which are static analog/digital exciters with fewer repair options and shorter life expectancies.		
Degradation: • Wear of moving parts • Obsolescence	**Expected Life:** 25-90 years[1]	**Turnover based on Current Replacement Rate:** Approximately 117 years

Demographics		
AGE (Yrs)	Qty	%

Governor:

Description: The governor is the machine that controls the mechanical speed of the turbine and ultimately the frequency of the AC power generated. Manitoba Hydro has three types of governors: mechanical, analog and digital. Maintaining the mechanical governors present many opportunities to refurbish and reverse engineer worn parts which extend their life. Newer governors are digital and have much shorter expected lives because of their nature to fail without warning and lack of replacement parts due to obsolescence.		
Degradation: • Wear of moving parts • Obsolescence	**Expected Life:** 25-125 years[2]	**Turnover based on Current Replacement Rate:** Due to a replacement program for electronic governor the turnover has recently been accelerated to approximately 50 years. Previous to that Governors have little history of replacement.

Transformers:

Description:
Power transformers in Generation Operations are typically very large, high value, long lead time, key components that are necessary to convert electrical energy from one voltage to another for the purposes of the delivering bulk electric power from the generators to the transmission system or the generating station for facility use. High voltages are used to minimize line losses over long distances, therefore these types of transformers typically increase the voltage level where power is being generated, move it long distances to areas where the power is to be utilized. Power transformers are oil filled for electrical insulation and cooling purposes.

Degradation:	Expected Life:	Turnover based on Current Replacement Rate:
• Insulation degradation or contamination due to heating (loading) or moisture • Corrosion • Mechanical deterioration of tap changer due to operations • Mechanical damage due to through faults or physical impact	40-70 years[3]	Approximately 150 years

TRANSMISSION

The Transmission Business Unit provides a reliable and safe transmission system for the delivery of electricity to domestic and out-of-province customers; this also includes the High Voltage Direct Current (HVDC) system used to delivery bulk electric power from the large generation base in northern Manitoba to the large load center in southern Manitoba. The AC system and the DC system are significantly different systems maintained by different groups within Manitoba Hydro and therefore the condition assessments were also completed by the appropriate group responsible for each system.

The Manitoba bulk electric system is an interconnected system that is impacted by system expansion as a result of load growth and the need for increased reliability. Asset failures on the transmission system have the potential to dramatically effect reliability, capacity and service but often times are mitigated due to the redundancy built into the bulk electric system. Certain assets are often replaced based not only on condition but other factors such as safety, system development, regulation, obsolescence or economic reasons.

Transmission System Breakers:

<table>

Protection Relays:

Description:
Protection relays are critical components used to protect utility assets and ultimately the safety of the public. Protection relays work hand in hand with breakers and are used throughout the utilities electrical system to isolate faults or other inappropriate parameters on the transmission system. Protection relays continuously monitor the electrical system and operate the appropriate breakers to avoid having parts of, or the entire system become unstable and collapse, and to avoid damaging expensive equipment or worse, fires and explosions. Sample represents 80% of total relays on the system.

Degradation:	Expected Life:	Turnover based on Current Replacement Rate:

HVDC System Converter Transformers:

Description:
Converter transformers are typically very large, high value, long lead time (3-5 years), key components that are necessary to an HVDC system. The converter transformers step the voltage up or down. The on load tap changer is an essential part of the valve groups' ability to control the voltage and current levels on the DC system. The transformer has much higher insulating values than normal transformers to be able to withstand the stresses from both the AC and DC systems.

Degradation:	Expected Life:	Turnover based on Current Replacement Rate:
• Short circuit • Poor connections • Corrosion • Tap changer deterioration • Insulation deterioration • Oil breakdown	40-50 years	73 years

HVDC System Valve Groups:

Description: The valve groups are located in the converter buildings. The converter valve is used to convert AC energy to DC energy at the generation end for less expensive transmission over long distances. High voltages are used to minimize line losses over long distances. HVDC uses only two conductors, and shorter less expensive transmission towers for increased savings. Once power reaches its destination the energy is converted to AC for transmission to customers. Large cooling systems keep the thyristors used in the conversion process from overheating and failing to a short circuit. This cooling system has detailed monitoring, and protection to ensure the valve group is maintained below the critical temperatures for thermal runaway of the thyristors.		
Degradation: • Short circuit • Poor connections • Valve cooling deterioration • Controls failure • Thyristor valve control	**Expected Life:** 25 years	**Turnover based on Current Replacement Rate:** 48 years

HVDC System Synchronous Condensers:

Description:

The synchronous condenser is located on the AC side of the southern DC station. All the synchronous condensers are electrically driven. The reactive power generated by the synchronous condenser improves system regulation of voltage and the inertia aids in stabilizing frequency. The synchronous condenser is constantly reacting to system conditions either consuming, or adding reactive power to stabilize the power system.

Degradation:	Expected Life:	Turnover based on Current Replacement Rate:

DISTRIBUTION

Distribution is responsible for the delivery of electricity from local sub-stations to the customer throughout the province of Manitoba. Methods of delivery are done by both overhead and underground methods using voltage levels that range from 4kV to 66kV.

Breakers:

Description: Breakers are strategically located throughout the bulk electric transmission system at voltages ranging from 4-kV to 66-kV and allow utility operators to control the flow of power by opening and closing breakers either locally or remotely from the System Control Center. There are several different types of breaker technology used including SF6 (or a mix of gases), air blast, vacuum and oil filled units.		
Degradation: • Insulation degradation • Mechanical Wear due to normal and fault operations • Obsolescence & depletion of spares • Poor connections	**Expected Life:** 60-65 years	**Turnover based on Current Replacement Rate:** 180 years[19]

Station Transformers:

Description:		
Station Class transformers are necessary to convert electrical energy from one voltage to another for the purposes of delivering bulk electric power over long distances. Tap changers are a component that can be added to a transformer to allow small incremental changes to the voltage ratio based on changing positions of the tap changer. This functionality is used for voltage regulation purposes.		
Degradation: • Insulation degradation or contamination due to heating (loading) or moisture • Corrosion • Mechanical deterioration of tap changer due to operations • Mechanical damage due to through faults or physical impact	**Expected Life:** 40-70 years[20]	**Turnover based on Current Replacement Rate:** 370 years[21]

Underground Cable:

Description: Underground cables are heavily insulated conductors, installed below grade, that are used to distribute electricity from a source (Distribution Stations) to padmount transformers. The insulating medium is a requirement not found on overhead conductors and allows the cables to be installed directly in the ground. The majority of these conductors are aluminum; however, some are copper. The insulation surrounding the cable can vary, from oil impregnated paper (PILC) to rubber (RINJ/RIPVCJ) to cross link polyethylene (XLPE/TRXLPE).		
Degradation: • Mechanical Damage (contact by construction crews, loss of oil due to leaks) • Electrical (heat from overloading decays cable insulation) • Environmental (moisture from surrounding soil permeates the insulation)	**Expected Life:** 30-70 years[22]	**Turnover based on Current Replacement Rate:** 328 years

Duct Lines:

Description: Ductlines are made up of bundled PVC pipes that are encased in an envelope of concrete. They are installed below grade between manholes and are used to provide an underground path for high voltage cables in heavily congested areas. They are most commonly found in the downtown core of Winnipeg, but are also used in suburban areas of Winnipeg and Brandon.		
Degradation: • Mechanical (ground movement, vibration due to vehicular traffic) • Environmental (soil condition, tree roots) • Age of construction material	**Expected Life:** 100 years	**Turnover based on Current Replacement Rate:** 378 years[23]

Padmount Transformers:

Description: These transformers are used to step high voltage power (24kV and below) down to a voltage that is usable by customers (600V and below). The service point between Manitoba Hydro and the customer is generally located immediately downstream of the secondary side of these units. These transformers, both single phase and three phase, are located at ground level on top of fiberglass or concrete pads.		
Degradation: • Ambient Temperature • Wind • Loading • Corrosion due to exposure to environment (contact with moist soil, road salt, limited air flow)	**Expected Life:** 50 years	**Turnover based on Current Replacement Rate:** 70 years

Overhead Primary Conductor:

Description:
Like the Transmission overhead conductor, these are the main high voltage, current carrying wire that distributes power from source (distribution stations) to load (the customer). These wires are generally made of bare aluminum alloy; however, some copper lines are still in operation. Some of these lines are covered by a polyurethane sheet; however, most are not.

Degradation:	**Expected Life:**	**Turnover based on Current Replacement Rate:**
• Mechanical (ice build-up, tree strikes) • Electrical (capacity overloading due to general load growth, high fault levels)	100 years	200 years[24]

Street Lights:

Description:		
Streetlight standards typically consist of a tubular steel or aluminum. This supports the lights and is used to provide roadway lighting in urban and high traffic locations. The majority of Manitoba Hydro street lights are concentrated within the City of Winnipeg and to a lesser extent in other large urban centers in the province. Street lights are generally installed on a pre-formed concrete base; however, can also be installed directly into the ground.		
Degradation: • Corrosion due to exposure to environment (contact with moist soil, road salt) • Mechanical Damage (contact with snow plows and vehicular traffic) • Installation methods • Material	**Expected Life:** 50-70 years[25]	**Turnover based on Current Replacement Rate:** 100 years

5. Current vs. 20 year Forecast of Asset Condition

The following condition assessment demographic charts estimates the impact on the condition of the assets if Manitoba Hydro implements the currently approved Capital Expenditure Forecast 2013 (CEF 13). CEF 13 includes approved spending for projects to refurbish and replace assets as well as asset sustainment programs. In some cases the CEF 13 does not capture the spending requirements surrounding program renewals and projects for assets that had not begun to show signs of significant deterioration at the time it was put together and there is no remaining funds to address these replacements.

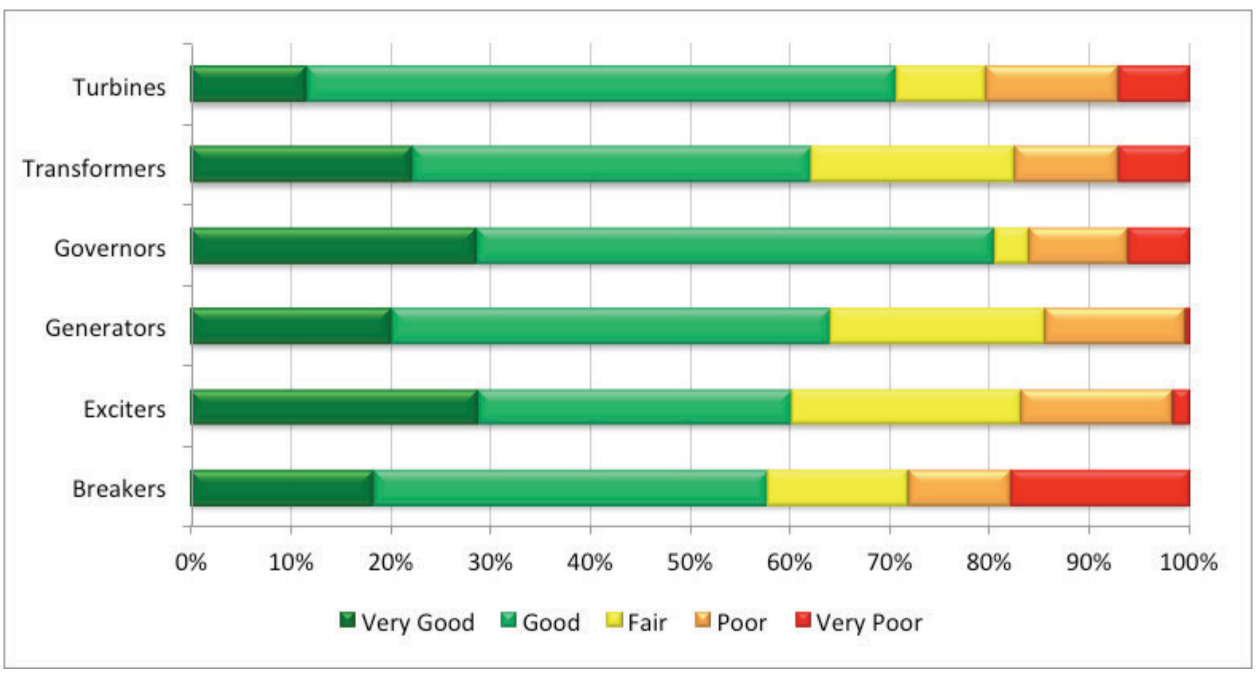
The charts are arranged so the reader can compare the current condition of all assets in each business unit to the forecasted condition 20 years from now.

The 20-year asset outlook for Generation Operations, Transmission and Distribution indicates significantly poorer asset health compared to current day conditions. Generation Operations, HVDC and transmission battery bank condition is not displayed in the forecast as they are replaced to maintain reliability at the end of their expected life.

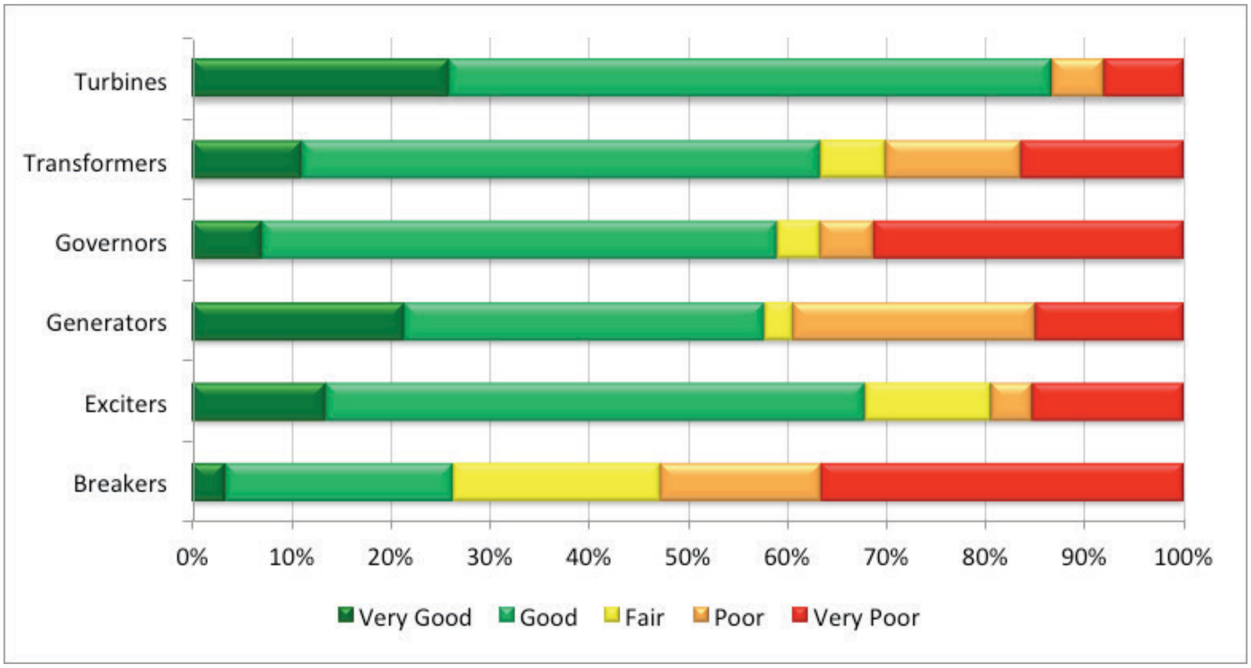
An alternative funding and resource plan will be required over the next 20 years to maintain or improve the overall condition of the Generation Operations, Transmission and Distribution Assets. This is based on the current asset condition and the effective remaining life that may dictate asset replacement.

GENERATION OPERATIONS

Current Asset Condition Assessment



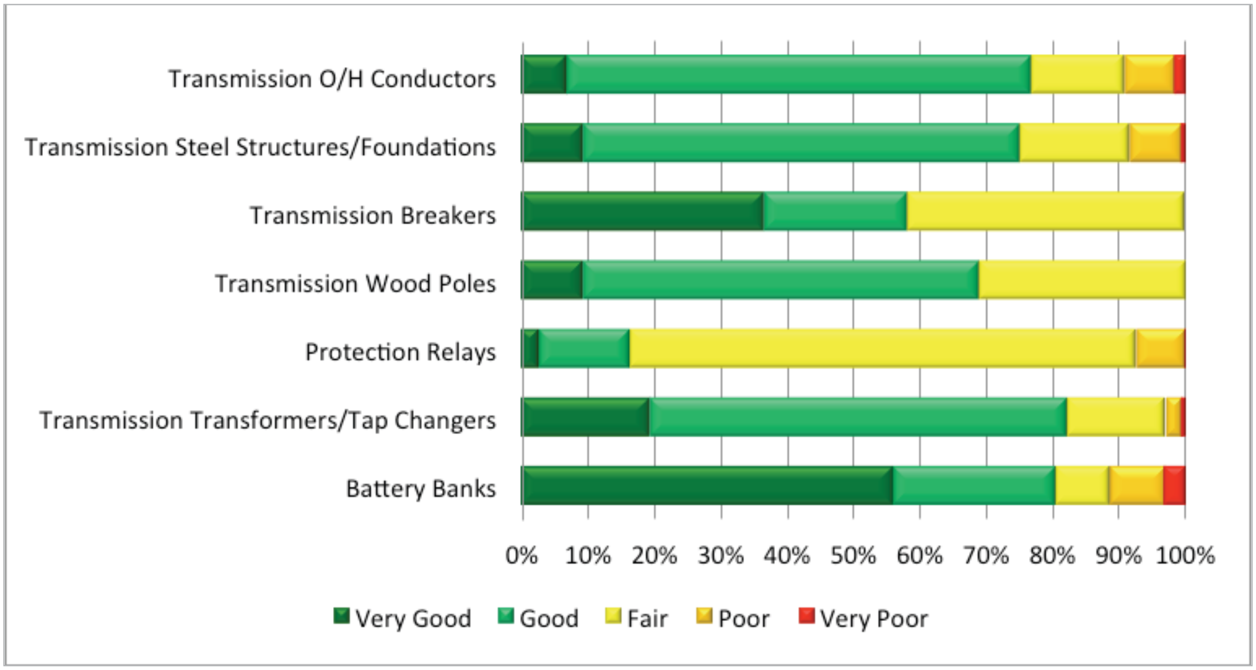
20 year Asset Condition Assessment Forecast



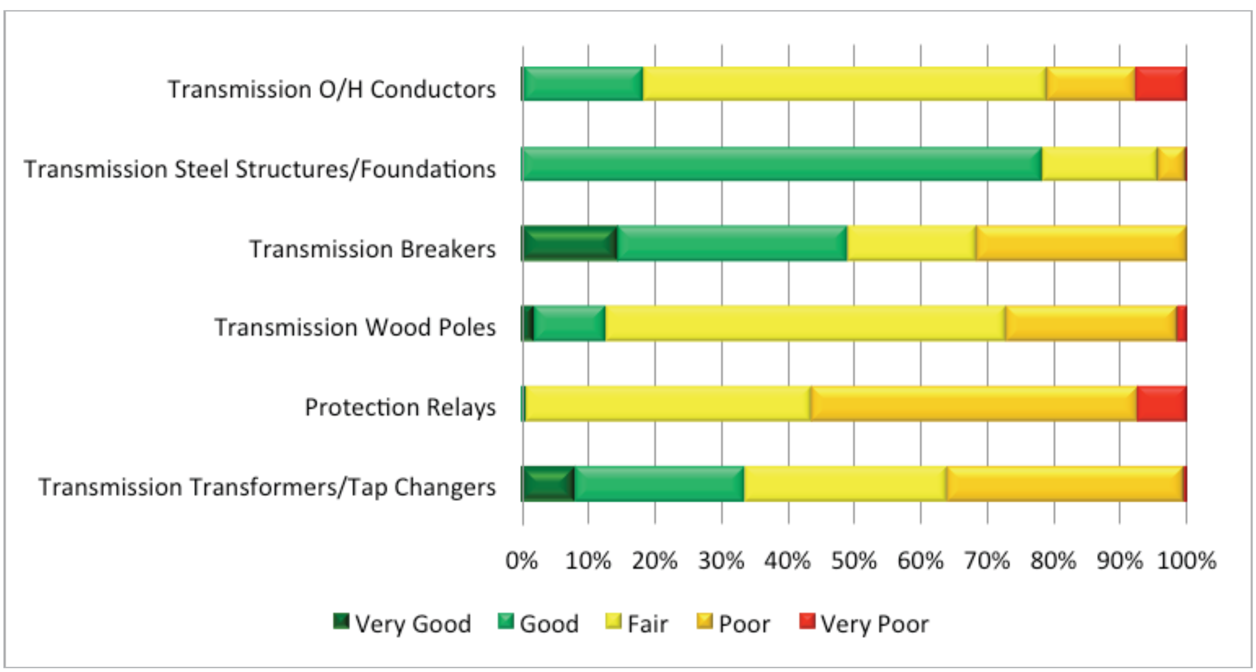
In the case of generators, the increased count of "poor" and "very poor" is due to having limited funds presently in place for their replacement. A generator replacement can cost up to $30,000,000 and in the event of limited funds it is often favorable to defer this work and address more less costly assets. The deferral of a generator replacement increases the risks of in-service failures. Many of the digital governors have an end of life which occurs within the 20-year forecast period. If there is not a project in place to address these assets, the funding may not be available and the assets will be run to the poorest condition. The transformer and breaker conditions will continue to drop as the funded work on these assets is currently not sufficient to address their excessive age.

TRANSMISSION

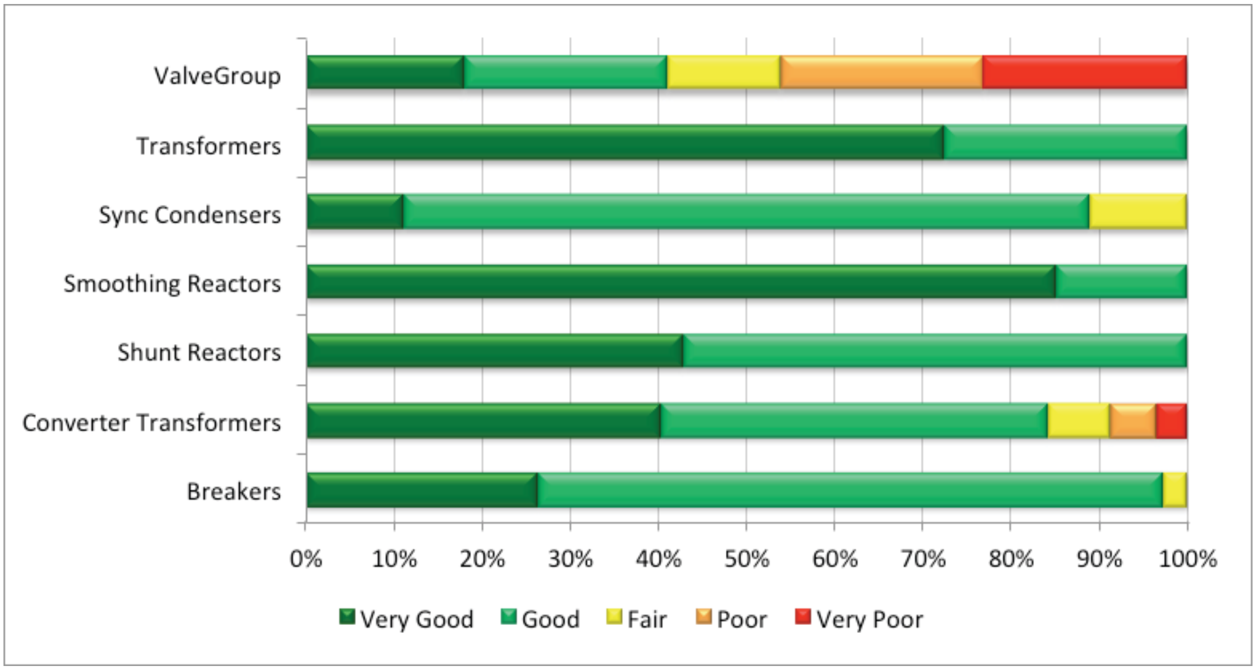
Transmission Summary of Assets



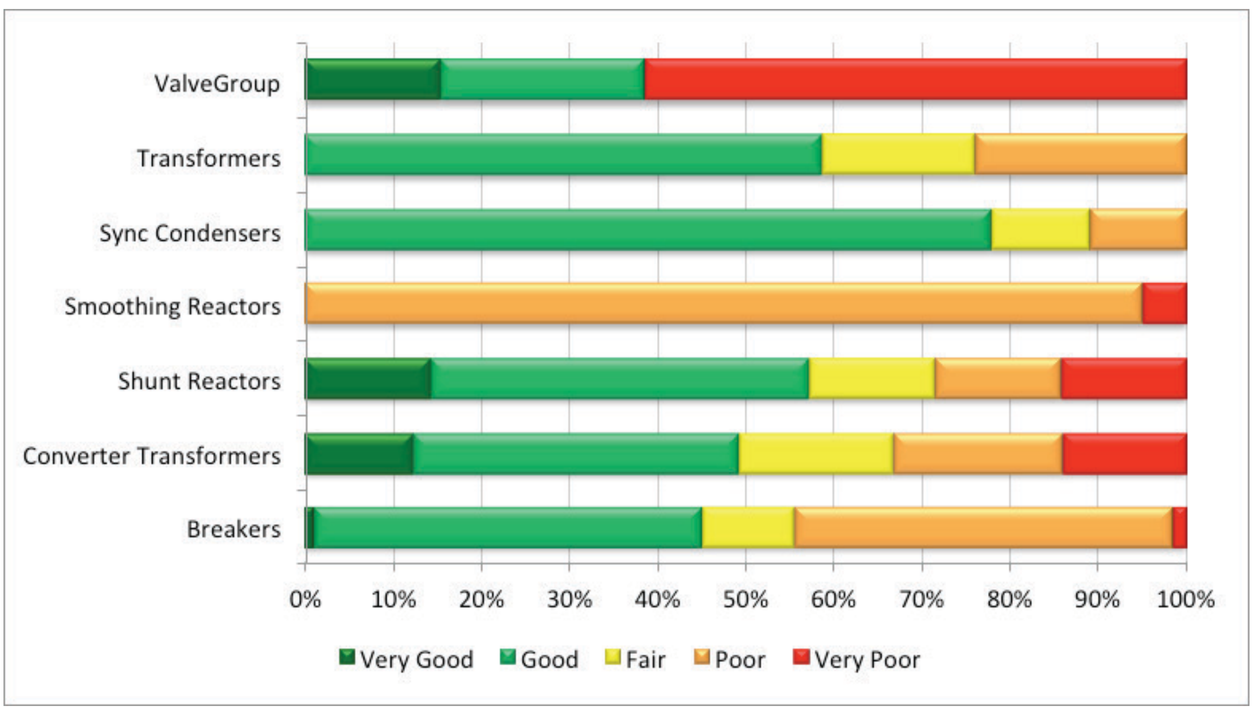
Transmission 20 Year Asset Forecast



HVDC Summary of Assets



HVDC 20 Year Asset Forecast



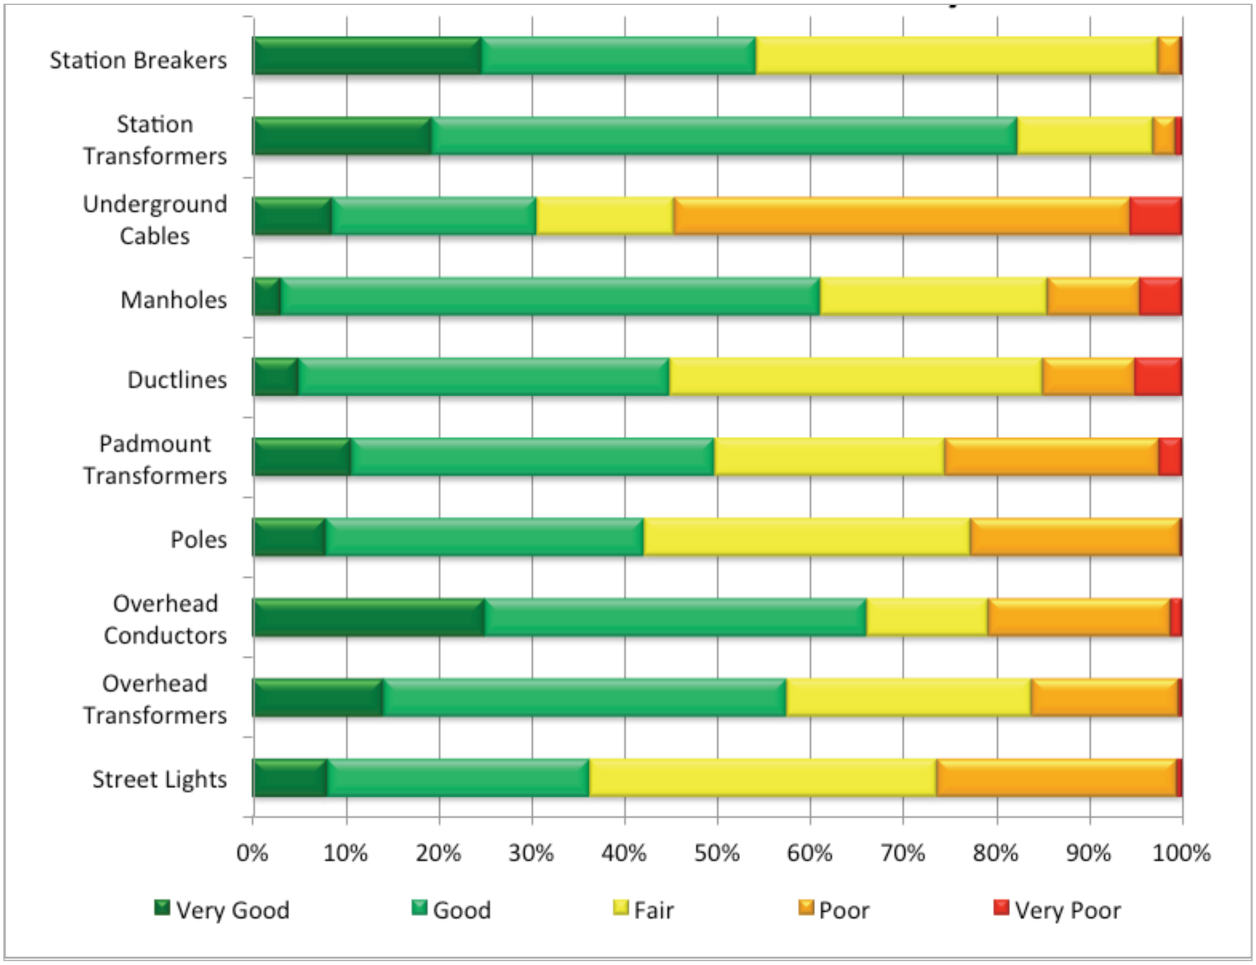
The Transmission 20 year forecast includes approved capital sustainment programs for breakers, transformers and transmission line wood pole structures. It should also be noted that capital projects/programs currently being executed will address Transmission O/H Conductor assets that are currently in “Very Poor” condition. There are also currently foundations associated with steel structures that are scheduled for repair due to condition.

In the case of breakers and protection relays, the increase in assets of “poor” and “very poor” condition is due in part to the effects of age and our declining ability to support the existing assets with obsolescence issues and/or a dwindling supply of spare parts, which limits the ability to extend “useful life”. For protection relays, it should be noted that the outlook does not include the impact of all future replacements associated with capacity enhancement projects. This is expected to impact less than 5% of the protection relays considered in this report. Wood poles, steel structures, conductors and transformers deteriorate into the “poor” category due mainly to the effects of aging and continued utilization. The transmission line asset forecasts do not include the impact of the Transmission Line Upgrades for NERC Alert project. These impacts will be incorporated into future forecasts as additional project details become available.

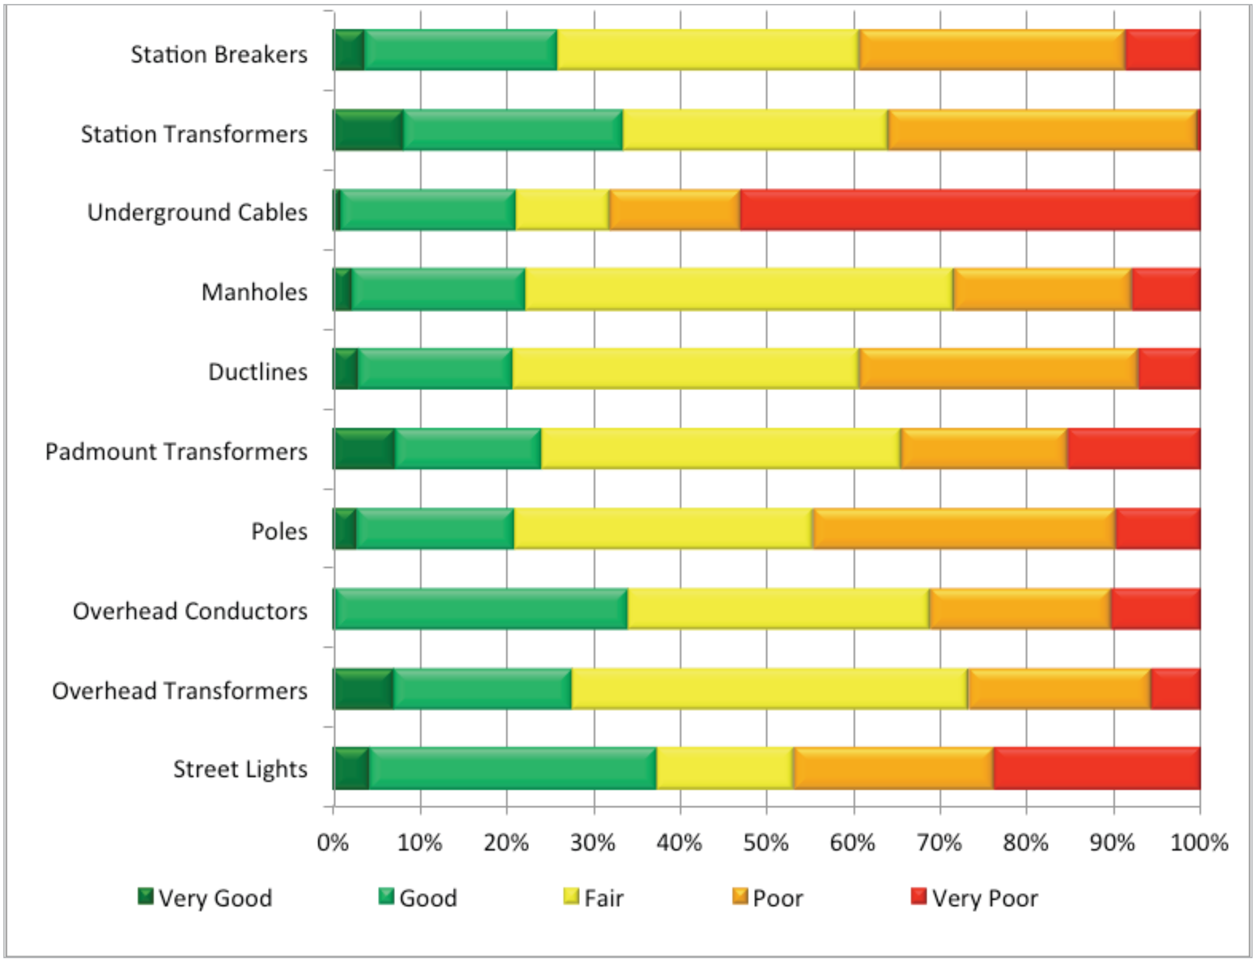
The HVDC 20 year forecast includes approved capital sustainment programs for breakers, transformers, synchronous condensers and valve groups. In the case of smoothing reactors, and valve groups, the increase in assets of “poor” and “very poor” is due to these assets reaching expected end of life prior to the 20 years occurring. Air core smoothing reactors deteriorate into the “poor” category in the last few years of the 20 year outlook due mainly to expected life. Since this is a new type of smoothing reactor, this forecast is based on industry guidelines for replacement. As Manitoba Hydro gains experience with this type of smoothing reactor, the condition forecast will be updated accordingly. It should also be noted that the Pole 2 Valve Group does not move into the Very Poor condition category until the last two years of the 20-year outlook period. HVDC Engineering is currently performing assessments of options to extend the life of the Bipole 1 Valve Group. The outcome of this work may modify the Valve Group condition forecast.

DISTRIBUTION

Current Distribution Summary of Assets



Distribution 20 Year Asset Forecast



As poles installed during the rural electrification program approach end of life, a dramatic increase in pole replacements is anticipated. Current resources will not be able to meet this demand and as a result, a significant increase in the number of assets transitioning from “poor” to “very poor” condition is expected. This is also anticipated for underground cables, as the majority of XLPE lines installed in the early 1980’s are also approaching end of life. It is forecasted that current cable replacement rates will not be able to meet the demand for this asset replacement. A similar trend will see a dramatic increase in street lights transitioning from “fair” to “poor” as a large segment of the direct installed assets will reach end of life within the next 20 years. The condition of these assets will continue to drop as the funded programs are currently not sufficient to address their excessive age.

Appendix A: Definitions and Acronyms

Definitions:

i. Asset Age = This criterion identifies how many years the asset has been in service or the date of manufacture (depending on data availability). For some asset classes, asset age remains a key criterion for evaluating asset health because it is more cost-effective and efficient to have a maintenance program that allows assets to run to failure with no condition assessments. For example, overhead transformers on the distribution system are run to failure.

ii. Expected life = The typical life span of an asset, provided it is not replaced sooner for other reasons such as government regulations, economic justification, system development, performance, safety issues, obsolescence/lack of spare parts, and/or unusual condition degradation. Under favorable operating environments, the asset may exceed its typical life span.

iii. In service = Equipment that is installed and energized, and seeing active commercial duty.

Acronyms:

ACSR= Aluminum Conductor	ACA= Asset Condition Assessment
Steel Reinforced	ASC= Armor Sheathed Cable
AHI= Asset Health Index	AH= Asset Health
AMPS= Applied Maintenance Planning System	ASTM= American Society for Testing and Materials
CB= Circuit Breaker	CEF= Capital Expenditure Forecast
CEATI= Center for Energy Advancement through Technological Innovation	CH4= Methane
C2H6= Ethane	C2H4= Ethylene
C2H2= Acetylene	CO= Carbon Monoxide
CO2= Carbon Dioxide	CO2/CO= Carbon Dioxide/Carbon Monoxide
CPF= Sub-Condition Parameter Score	CPS= Condition Parameter Score
CSC= Customer Service Center	DC= Direct Current
DGA= Dissolved Gas Analysis	DMPS= Distribution Maintenance Planning System

DR= De-Rating Multiplier	eGIS= electronic Geographic Information System
EPRI= Electrical Power Research Institute	H2= Hydrogen
HI= Health Index	HMI= Human Machine Interface
HVDC= High Voltage Direct Current	IFT= Interfacial Tension
IR= Infrared	LMA= Loss of Metallic Area
LTC= Load Tap Changer	MCC= Motor Control Center
PILC= Paper Insulated Lead Covered Cables	RINJ= Rubber Insulated Neoprene Jacket
RIPVCJ= Rubber Insulated Poly Vinyl Chloride Jacket Cables	RTS= Rated Tensile Strength
SF6= sulfur hexafluoride	SFC= Stat Frequency Converter
SFRA= Swept Frequency Response Analysis	TRXLPE= Tree Retardant Cross Linked Poly Ethylene
WCP= Weight of Condition Parameter	WCPF= Weight of Sub-Condition Parameter
XLPE= Cross Linked Poly Ethylene Cables	

Appendix B: Generation Operations Detailed Methodology

GENERATION OPERATIONS

Asset Condition Assessment Methodology

Manitoba Hydro's methodology determines Asset Health (AH) by performing standardized equipment condition assessments as part of the maintenance program. Technical experts take the condition assessment and factor in the field feedback and their judgment in conjunction with the engineers, the asset's age, life curve, and performance to calculate the AHI. This provides a more accurate and reliable index of asset health that aligns better with asset management.

The general breakdown of each assets health index methodology includes:

- Providing general descriptions of each asset class
- Showing the demographics of each type of asset
- Describing condition assessment techniques for each asset class
- Determining end-of-life criteria based on condition assessments of each asset class
- Formulating the Asset Health Index using data from asset health, age, performance and life curve.
- Calculating a numerical condition score for each equipment asset class to indicate the reliable service life remaining.
- Ensuring repeatability, by documenting the methodology and data sources used.

The results are used to help decide acceptable risk and clarify the consequences of an asset's criticality issues, determine acceptable reliability goals, ensure compliance requirements are met, and meet performance expectations.

Transformers:

The following tests/inspections were considered in calculating a condition index score:

- Furan levels in oil
- Dissolved Gas Analysis
- Capacitance Bridge and Dissipation Factor
- Operations & Mtce History (see Hydro AMP guide for more details on this)
- Age
- DC Winding Resistance Test
- Turns Ratio Test

In select cases, the following test results were considered (where available):

- Core-to-Ground Resistance (Megger)
- Swept Frequency Response Analysis (SFRA)
- Internal Inspections
- Degree of Polymerization (based on internal inspections and furan levels in oil)

Generators:

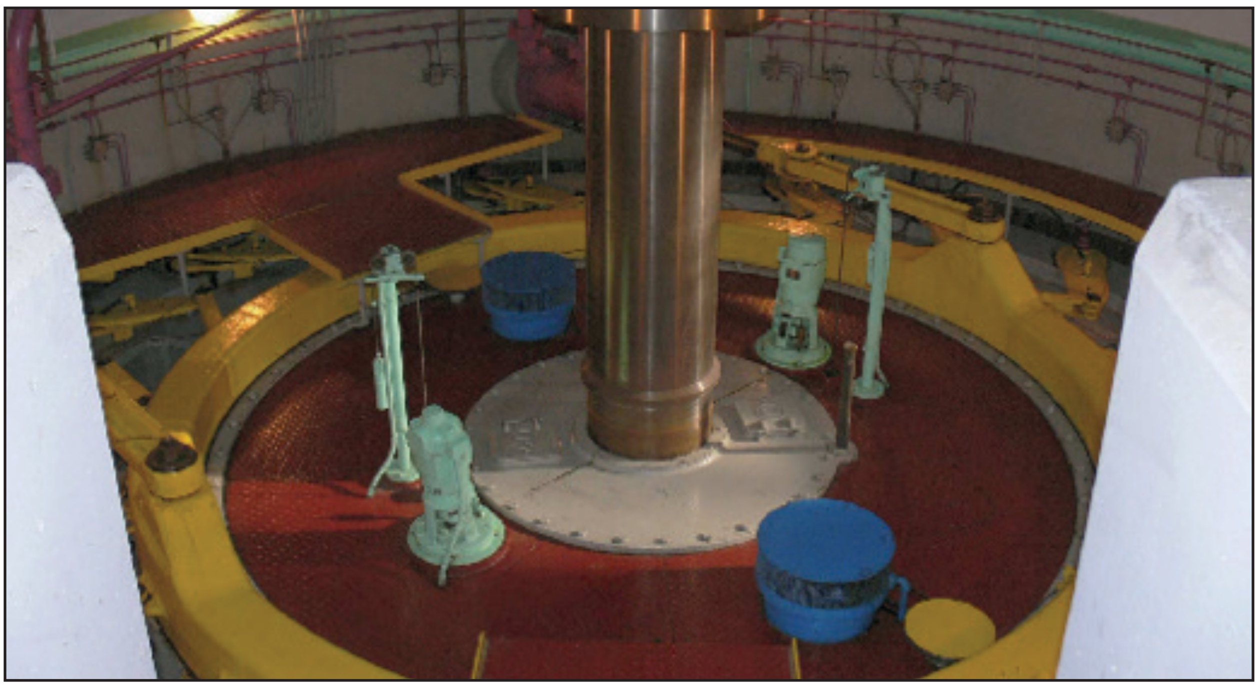
The generators were reviewed using routine historical testing data (high direct voltage ramp). In addition factors such as age, neighboring unit condition, and overhaul history were used to create the condition scores and replacement dates.

Turbines:

For determining the condition score of the Turbines, a combination of the following methods was used:

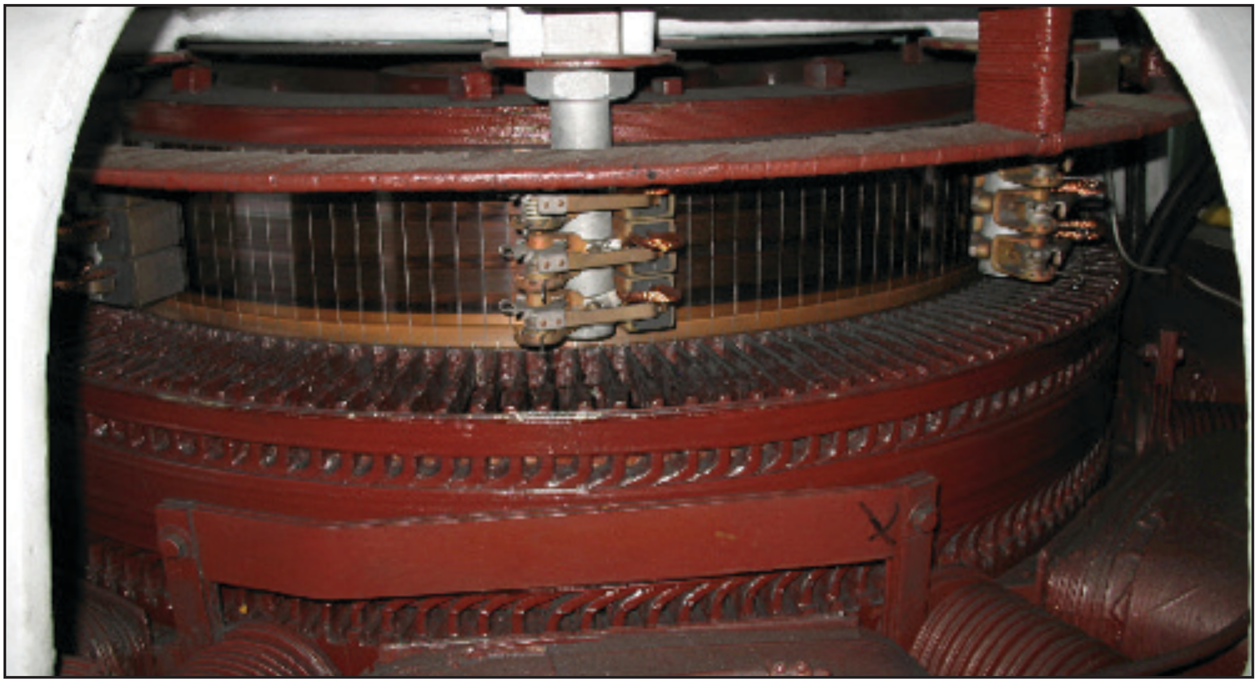
- Interviews with site maintenance staff to determine any known issues on each turbine based on existing maintenance record and staff experience.
- Review of available past maintenance records, engineering drawings, and relevant reports.
- Scheduled outage-based Non-Destructive Examination of major turbine components, including the runner, shaft, visible embedments, headcovers, and control system components.

The above information gathering and inspection process is currently ongoing, and largely dependent on scheduled unit maintenance outages. The initial pre-inspection scoring is based on the interview and information research phases, which prioritizes the inspection sequence.



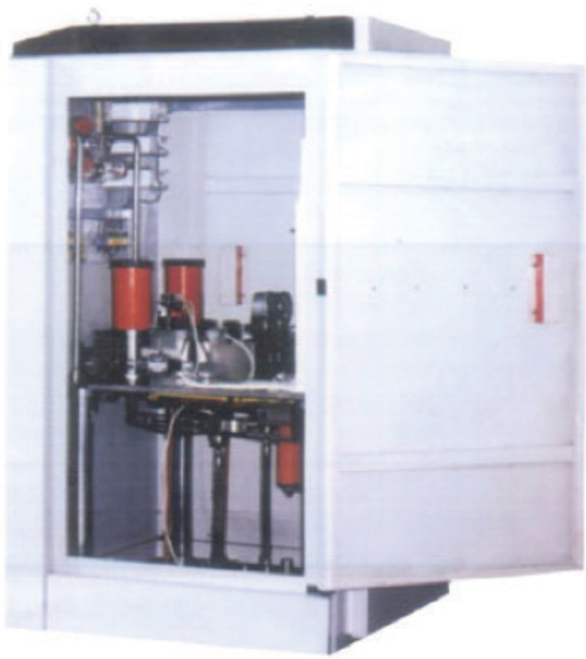
Exciters:

The excitation systems were reviewed on a family of exciters basis versus an individual basis. The approach was appropriate due to the short equipment life of the products. Individual performance deviations were treated as resolvable issues through routine maintenance.



Governors:

Condition scores were generated by applying an age and performance based score to each type of governor. Most governors in our system do not have performance issues so the majority of the scores are based on age. This score was combined with empirical knowledge to generate an adjusted value which was agreed to under consensus by hydro maintenance engineers to best represent actual condition and expected life.



Breakers:

The equipment condition evaluation involved the review and assessment of the following criteria:

- Equipment performance information from the following sources:
    - Electronic defective work order information and notes contained within Applied Maintenance Planning System- AMPS
    - Reliability information from Apparatus Maintenance Reliability Reports, Center for Energy Advancement through Technological Innovation (CEATI), Electrical Power Research Institute (EPRI) and others
    - Paper maintenance documentation from site

- Maintenance records from the following sources:
    - Electronic maintenance work order information and notes contained within AMPS
    - Paper maintenance documentation from site
    - Electronic circuit breaker analysis results if available
    - Insulation test results in electronic and paper form

- Evaluation of Equipment Obsolescence
    - Equipment age
    - Spare parts availability from the following sources:
        - AMPS stores inventory
        - Apparatus Maintenance Stores inventory
        - Salvaged parts inventory
        - Original equipment manufacturer
    - Technical Support availability from the following sources:
        - Internal staff
        - Original equipment manufacturer
        - Other equipment support companies

52G Generator Breaker & 29G Disconnect (Typical)

Battery Banks:

- Visual inspections
- Past test data (if available) (resistance(now)/conductance(before), specific gravities, and voltages)
- Previous performance of batteries if they have been put to use (i.e. AC power loss and batteries were called upon to carry the DC load)
- Past maintenance records

Appendix C: Transmission Detailed Methodology

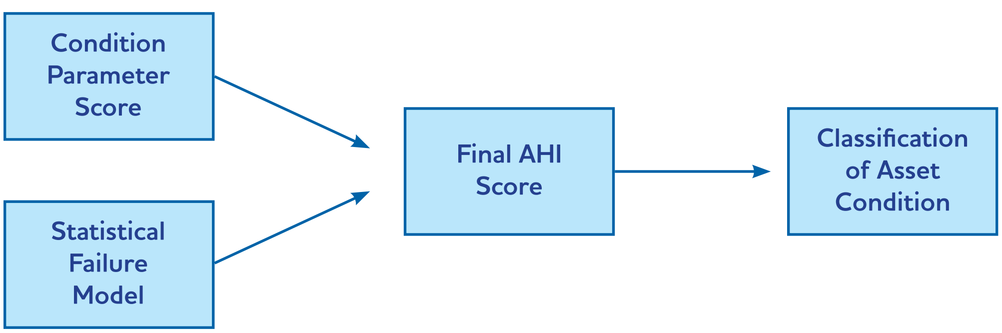
TRANSMISSION

Asset Condition Assessment (ACA) Methodology

Background:

The Transmission Business Unit (BU) began its asset condition assessments in 2012 by hiring a third party consultant with expertise in the development of condition assessment methodologies for utility grade high voltage (HV) equipment. This third party consultant worked with Transmission's subject matter experts to provide asset condition assessment methodologies and statistical failure models for transmission system station transformers, tap changers, breakers and transmission wood poles structures. The remaining Transmission asset condition assessment methodologies presented in this report, while similar in approach, were developed by the Transmission Asset Strategies group in consultation with subject matter experts across the Business Unit. This section describes these methodologies.

Where an asset has a statistical failure model available, the model has been incorporated into the AHI scoring methodology. The purpose of this is to increase the extent to which the AHI reflects the likelihood of failure. Statistical failure models were available for breakers, transformers and transmission line wood pole structures. These models were provided by the above mentioned consultant and were based on the consultant's industry failure curves, on subject matter expert input and limited failure data provided by Manitoba Hydro and on the consultant's proprietary methodology to link condition parameter scores to probability of failure.



Transmission will continue to evolve its existing condition assessment methodologies as it gains experience with these models and to develop and implement new condition assessment models for asset classes such as instrument transformers and equipment bushings, to the extent that there's a positive business case to do so.

The boundaries between the different classifications of the AHI Score (i.e. Very Good, Good, Fair, Poor and Very Poor) were determined using the classification definitions provided in Section 4 of the report.

Transmission System Substation Transformers

Health Index Formulation

This report presents a transformer/tap changer AHI score distribution that, where applicable, reflects the combined AHI scores of the transformer (main tank) and tap changer. The combined AHI score is intended to reflect the likelihood that either the transformer or the tap changer will fail and need to be replaced or refurbished. It should be noted that the remedial action for a main tank failure may be very different from the remedial action required for a tap changer failure.

The health index formulation for the transformer main tank uses condition parameters that significantly contribute to the long-term degradation of the transformer. For substation transformers the condition parameters and sub-condition parameters were selected as follows:

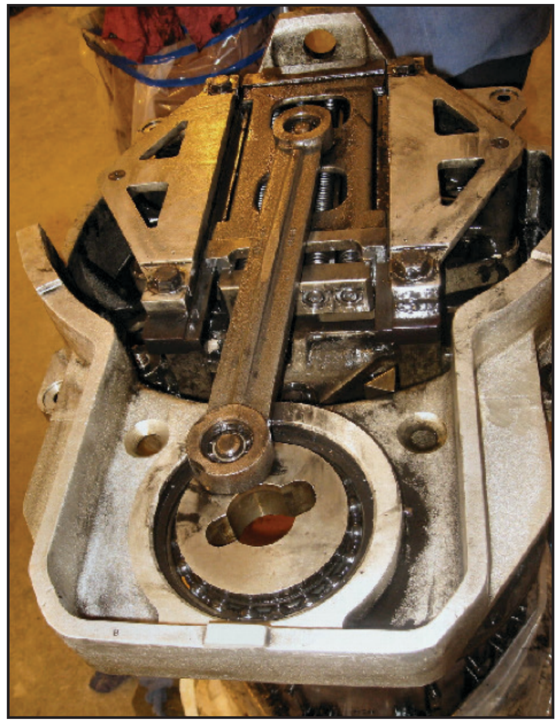
- Insulation
    - Oil Quality
    - Oil DGA
    - Power dissipation*
    - Insulation Issues
- Cooling
    - Cooling system
- Sealing and connection
    - Insulation containment
    - Tank condition
    - Grounding
    - Oil conservator
    - Connections
- Service record
    - Loading*
    - Age

*When available in electronic format.

Where available, source data used for calculating Asset Health Index scores was taken from various Transmission electronic database systems as well as actual test results. Additional factors such as known design flaws or performance issues were also accounted for in the AHI.

Transmission System Load Tap Changers

Health Index Formulation



For transformer tap changers the condition parameters and sub-condition parameters have been selected as follows:

- Operating mechanism
  - Switch/contact
  - Tap selector head
  - Diverter
  - Control – Electrical
  - Control – Mechanical
  - Cabinet
  - Pressure relief
- Arc extinction
  - Diverter vacuum
  - Contacts
- Sealing and connection
  - Gasket or sealant
  - Oil level
  - Breather
- Insulation
  - Oil DGA
  - Oil quality
  - Insulation
- Service record
  - Operations
  - Failure to operate
  - Age

For transformer tap changers, the operating mechanism, sealing & connection, arc extinction and service record sub-condition parameter inputs were supplied by data and/or corrective maintenance records obtained from an electronic maintenance database(s) whereas much of the insulation sub-condition parameter inputs were supplied by actual test data. Additional factors such as obsolescence, known design flaws or performance issues were also accounted for in the AHI.

HVDC System Transformers:

The following tests/inspections were considered in calculating a condition index score:

- Furan levels in oil
- Dissolved Gas Analysis
- Capacitance Bridge and Dissipation Factor
- Operations & Mtce History
- Age
- On Load Tap Changer condition
- DC Winding Resistance Test
- Turns Ratio Test
- Core-to-Ground Resistance (Megger)
- Swept Frequency Response Analysis (SFRA)
- Internal Inspections
- Degree of Polymerization (based on internal inspections and furan levels in oil)
  The transformers have a useful life expectancy of 40-70 years.

Transmission System Circuit Breakers

Health Index Formulation

For circuit breakers the condition parameters and sub-condition parameters have been selected as follows:

- Operating mechanism
    - Lubrication
    - Linkage
    - Cabinet
    - Operating type (as a multiplier)
- Contact performance
    - Closing timing
    - Trip timing
    - Contact resistance
    - Contact over-travel
    - Arcing contact
- Arc Extinction
    - Heater
    - Leakage
    - Interrupter
    - Oil DGA
- Insulation
    - Power factor
    - Oil quality (applicable to oil breakers only)
    - Insulation
- Service record
    - Operating counter
    - Age

For circuit breakers, the operating mechanism, contact performance, arc extinction and service record sub-condition parameter inputs were supplied by data and/or corrective maintenance records obtained from an electronic maintenance database(s) whereas much of the insulation sub-condition parameter inputs were supplied by actual test data. Additional factors such as obsolescence, known design flaws or performance issues were also accounted for in the AHI.

HVDC System Breakers:

The equipment condition evaluation involved the review and assessment of the following criteria:

- Equipment performance information from the following sources:
  - Electronic defective work order information and notes contained within AMPS
  - Reliability information from Electrical Power Research Institute (EPRI) and others
  - Paper maintenance documentation from site
- Maintenance records from the following sources:
  - Electronic maintenance work order information and notes contained within AMPS
  - Paper maintenance documentation from site
  - Insulation test results in electronic and paper form
- Evaluation of Equipment Obsolescence
  - Equipment age
  - Spare parts availability from the following sources:
    - AMPS stores inventory
    - Original equipment manufacturer
  - Technical Support availability from the following sources:
    - Internal staff
    - Original equipment manufacturer
    - Other equipment support companies

The breakers have a useful life expectancy of 40-65 years

Protection Relays

Health Index Formulation

The methodology for protection relays, be it electromechanical or solid state, was completed in a very similar manner to the approach taken by the third party consultant with the exception that the model was simplified given probability of failure curves were not developed or readily available.
For protection relays the condition parameters and sub-condition parameters have been selected as follows:

- Age
- Manufacturer support
- Spare parts
- Maintenance performance

For protection relays, the condition parameter inputs were supplied by data and/or corrective maintenance records obtained from an electronic maintenance database(s). Additional factors such as known obsolescence and performance issues were also accounted for in the AHI.

Transmission System Battery Banks

Health Index Formulation

Batteries are an asset that are quite different from most other electrical assets and need to be treated as such. The methodology for battery banks differs somewhat from other assets in that a formula using age, potential failures, functional failures along with appropriate weighting factors is used to establish an AHI. The difference between potential and functional failures is normally a matter of degree; a potential failure requires corrective maintenance but was an issue that, due to regular inspection(s), would have become a functional failure had it not been caught in time. Functional failures can be described as events such as "Fails to regulate voltage" or other such conditions that impact the actual performance of the battery bank should they be called upon for service.

For battery banks the condition parameters and sub-condition parameters have been selected as follows:

- Age
- Past maintenance history including potential and functional failures

For battery banks, the condition parameter inputs were supplied by data and/or corrective maintenance records obtained from an electronic maintenance database(s).

HVDC System Battery Banks:

The equipment condition evaluation involved the review and assessment of the following criteria:

- Visual inspections
- Past test data (if available) (resistance(now)/conductance(before), specific gravities, and voltages)
- Previous performance of batteries if they have been put to use (i.e. AC power loss and batteries were called upon to carry the DC load)
- Past maintenance records

The battery banks have a useful life expectancy of 20 years

Transmission System Steel Structures/Grillage

Due to the nature of steel structures/grillage, their associated foundations combined with available asset data, the methodology differs from that used by the third party consultant. Age was one of two characteristics used for condition assessment of transmission structures, excluding wood structures, and accounts for 20 percent of the condition index. Actual asset condition obtained from Manitoba Hydro's transmission line patrol database was the second characteristic used and accounts for 80 percent of the condition index. Reports reviewed for each line summarize annual visual inspections and note problems such as bent/broken/cracked footings, submerged/sinking/heaving footings, tilted footings, spreads, and bent tower steel.

Transmission System Overhead Conductors

Health Index Formulation

Due to the nature of overhead conductors, the methodology differs from that used by the third party consultant. Age was the primary qualifier used for condition assessment of transmission conductors. Reports from Manitoba Hydro's transmission line patrol database were reviewed for each line and used to validate the condition assigned based on age. These reports summarize annual visual inspections and note problems such as broken strands, bird caging, nicks/scars, and burn marks. For several lines the condition was adjusted to more accurately reflect the maintenance patrol reports.

HVDC System Synchronous Condenser:

The criteria used in evaluating the condition of the synchronous condenser are as follows:

- Age of the asset
- Maintenance history -repairs, leaking, increased tolerances, or additional maintenance impact the score. Discussion with the project manager to determine what additional work was carried out between overhauls.
- Operation performance - review of outages to see if there have been additional outages, or vibration issues.
- Physical Condition- Visual of the exterior for signs of deterioration, review of notes on internal inspection, plus assessments from engineering make up this score.

The synchronous condensers have a useful life expectancy of 65 years. The refurbishment programs, every 15 years, address the major issues found through maintenance, failures and obsolescence. The refurbishment of the unit substantially affects the life expectancy of these units.

HVDC System Shunt Reactor:

The criteria used in evaluating the condition of the shunt reactor are as follows:

- Age of the asset
- Maintenance history – oil byproduct evaluations, repairs, or additional maintenance would reduce the score.
- Operation performance - review of outages and a corresponding reduction in score corresponding with the seriousness of the failures.
- Physical condition- visual of the interior and exterior for signs of deterioration, score is combined from two items. Greater emphasis is placed on the findings during an internal inspection of the unit by the engineers.

The shunt reactors have a useful life of 35 years.

HVDC System Smoothing Reactor:

The criteria used in evaluating the condition of the smoothing reactor are as follows:

- Age of the asset
- Maintenance history - repairs, or additional maintenance would reduce the score.
- Operation performance - review of outages and a corresponding reduction in score for failures.
- Physical condition - visual of the exterior for signs of deterioration

The smoothing reactors have a useful life of 25 years.

HVDC System Converter Transformer:

The criteria used in evaluating the condition of the converter transformer are as follows:

- Oil Samples - review of dielectric strength, moisture and combustible gas generation.
- Power Factor - review of capacitance bridge tests and excitation current
- Winding DC Resistance - considers the test results from resistance tests, turn to turn ratio test and SFRA tests
- Operation and maintenance - review of outages, maintenance history, and a corresponding reduction in score for failures.
- Internal inspections of units looking for core shifting, missing blocks. External inspections looking for weld cracks, leaks, and cracked porcelain. The engineer's internal inspection is more heavily weighted than the exterior inspection.
- Age of the unit

The converter transformer has a useful life of 40-50 years.

HVDC System Valve Group

The criteria used in evaluating the condition of the valve group are as follows:

- Age of unit
- Maintenance history - repairs, unavailability of parts or additional maintenance would reduce the score
- Operational performance - review of outages to see if there have been additional outages, and a corresponding reduction in score for failures
- Physical Condition - visual of the exterior for signs of deterioration, broken fasteners, leaks in piping, loss of support for cooling pipes, and optical fibres.

The valve group has a useful life of 25 years.

Valve groups in Bipole 2 are all of the same generation and are all showing similar wear characteristics. Bipole 1 has two different valve group types in Pole 1 and Pole 2 and are showing different issues. Within Pole 1 there are differences in the issues found, which makes direct comparisons of the valve groups difficult. This therefore requires individual assessments of the valve groups to determine their respective conditions.

The failure of a valve group is a gradual process as various components wear out, or fail and require custom made solutions to restore to service. Manufacturers only continue supporting a valve group design for a limited time. Eventually there are too many items to have custom designed, and built causing the replacement of the valve group.

HVDC System Valve Group Cooling:

The criteria used in evaluating the condition of the valve group cooling are as follows:

- Age of the asset
- Maintenance history – repairs, or additional maintenance would reduce the score
- Operation performance – review of outages, reduced cooling capacity, interventions for repair and clearing of fins with custom cleaners are considered and a corresponding reduction in score applied.
- Physical condition – visual inspection of the exterior for signs of deterioration (fins bent, deposits on coolers that can no longer be cleaned, rust, leaks, etc.)

The valve cooling has a useful life of 20 years.

The coolers seldom fail in a destructive manner. They usually slowly deteriorate losing capacity due to blockages, fin damage and buildup on the fins that no longer comes off. At some point this results in a reduction of power output, and loss of revenue. When this point is imminent the coolers are specified for replacement.

The failure of a valve group is a gradual process as various components wear out, or fail and require custom made solutions to restore to service. Manufacturers only continue supporting a valve group design for a limited time. Eventually there are too many items to have custom designed, and built causing the replacement of the valve group.

Appendix D: Distribution Detailed Methodology

Asset Condition Assessment Methodology

Distribution Asset Maintenance has performed a thorough review of the eight key assets to gain a better understanding of the current demands on the system and how they will impact performance over the next 20 years. This study took into account asset demographics, degradation mechanisms, inspection and maintenance, asset health, risk and valuation so that potential investment gaps could be identified and addressed.

The health indexes of the eight key assets were based upon the following:

- Asset Age
- Asset Type
- Inspection Programs
- Maintenance Programs
- Historical Data

These values are used to determine an overall asset health index, which is as follows:

- Very poor = Beyond acceptable level of risk and replacement is required (Condition Index 0 -1.49)
- Poor = Manageable level of risk; May replace asset(s) at this level if criticality assessment indicates risk needs to be mitigated or if a business case provides justification (approaching or past expected end of life) (Condition Index 1.5- 3.49)
- Fair = Long term service without notable measures of degradation (still in its useful part of its life) (Condition Index 3.5 – 4.99)
- Good = Midterm service without notable measures of degradation (in the prime of its useful life) (Condition Index 5 – 8.49)
- Very Good = Like new operating at expected measure of performance (early in its life) (Condition Index 8.5 -10)

Circuit Breakers:

Please refer to the Circuit Breaker Health Index Formulation description, which can be found in Appendix D: Transmission Detailed Methodology.

Station Transformers:

Please refer to the Station Transformer Health Index Formulation description, which can be found in Appendix D: Transmission Detailed Methodology.

Overhead Transformers:

The assessment of overhead transformers is based on the following criteria:

- Age
- Regularly Scheduled Visual Inspections
- Regularly Scheduled Grounding System Inspection

Overhead transformers consistently outlast the pole structures that support them. Generally, they are replaced before the end of the expected useful life due to various system improvement projects (e.g. voltage conversions, transformer capacity upgrades, line refurbishments). As a result of this, the AHI is based primarily on age.

Visual inspections are required to be completed once every six years for every overhead distribution circuit. As part of these inspections, operational staff examines the transformer installation and note any signs of potential problems, such as oil leakage, overloading, corrosion and tree contacts.

Overhead transformers have a useful life expectancy of 75 years.

Padmounted Transformers:

The assessment of padmounted transformers is based on the following criteria:

- Age
- Regularly Scheduled Visual Security Assessment
- Regularly Scheduled Maintenance Inspection

Padmounted transformers are replaced at the end of the expected useful life resulting from regularly scheduled condition assessments. As a result of this, the AHI is based primarily on age.

Underground transformers have a yearly security check to ensure they are locked, not leaning severely, accessible, and no large oil leaks are visible externally. They also have a maintenance inspection done on a 6 year cycle where they are opened, cleaned, and thoroughly inspected.

Padmounted transformers have a useful life expectancy of 50 years.

Overhead Primary Conductor:

The assessment of overhead primary conductor is based on the following criteria:

- Age
- Conductor Type
- Regularly Scheduled Visual Inspections

Overhead primary conductors have a very low rate of failure and consistently outlive the structures that support them. Replacement of these assets generally take place before the end of the expected useful life due to performance related issues (e.g. demand exceeds conductor current carrying capacity, conductor impedance caused poor voltage profiles). As a result of this, the AHI is based primarily on the capacity of the conductor type; however, the age of the line is also taken into consideration.

Although specific testing is not performed on distribution conductors, visual inspections do occur on a regular basis. Visual inspections are required to be completed once every six years for every overhead circuit.

Overhead primary conductors have a useful life expectancy of 100 years.

Manholes:

The assessment of manholes is based on the following criteria:

- Age
- Construction Method (built in place, pre-fabricated)
- Construction Material (concrete, brick, clay tile)
- Regularly Scheduled Visual Inspections

The AHI of the manhole population is based upon a 2012 survey of 850 manholes within the downtown region of Winnipeg. The results of the study were then extrapolated over the entire population of manholes in Manitoba to determine the overall AHI.

Manhole inspections are completed on a three year cycle by operational staff. A visual check on the structural integrity of the manhole structure is performed, as well as an infra-red inspection of all electrical connections within the vault. The visual check includes the manhole cover, cover ring, collar, walls, ceiling, and floor.

Manholes have a useful life expectancy of approximately 80 years.

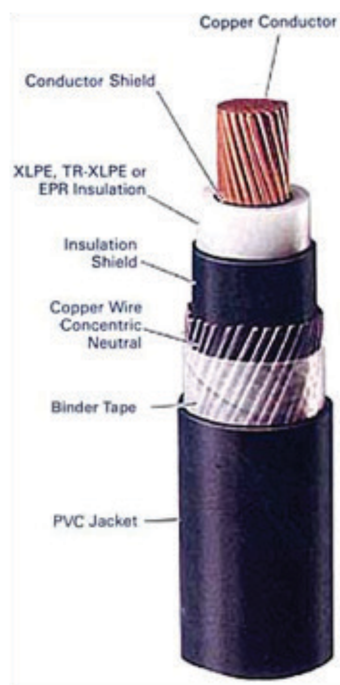
Underground Cables::

The assessment of underground cables is based on the following criteria:

- Age
- Cable Type (PILC, RINJ/RIPVCJ, XLPE/TRXLPE)
- Cable Manufacturer

Due to the extreme difficulty in inspecting buried cables, there is currently no regularly scheduled inspection program in place that is used to evaluate the health of these assets. As a result, the AHI of the underground cables are determined by the age of each cable type.

Underground cables have a useful life expectancy of approximately 30 – 70 years, depending on the cable type.



Ductlines:

The assessment of ductlines is based on the following criteria:

- Age
- Construction Material (PVC pipe, cast iron pipe, ceramic pipe)
- Visual Inspections

Ductlines have a very low rate of failure and consistently outlive the manholes and structures which they are connected to. Replacement or refurbishment of these assets generally take place only when associated work (i.e. manhole or station rebuilds) is scheduled within the area in order to take advantage of reduced construction costs.

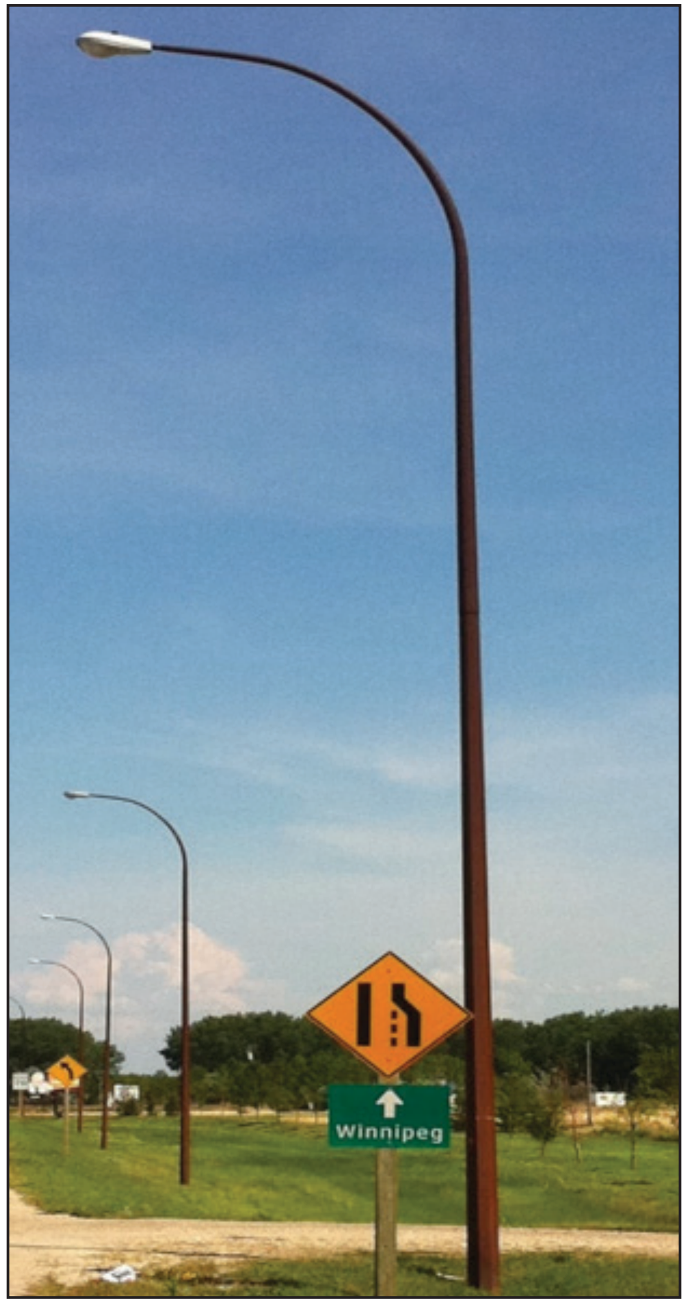
Although specific testing is not performed on duct lines, visual inspections do occur as part of regularly scheduled manhole inspections. As part of these inspections, operational staff will note if the duct line is exhibiting any visible signs of shifting or individual duct segments are collapsing or crumbling.

Manholes have a useful life expectancy of approximately 100 years.

Street Lights:

The assessment of street lights is based on the following criteria:

- Age
- Regularly Scheduled Visual Inspections
- Installation method (concrete pile, direct bury, power screw)



The AHI is based upon the DMPS reports of the previous four years and extrapolated over the entire street light population.

City of Winnipeg streetlights are scheduled for inspection once every four years. Standards are inspected by the Streetlight Maintenance and Underground Inspection Section. Outside the City of Winnipeg inspections are organized by the local CSC.

Street lights have a useful life expectancy of approximately 50 – 70 years, depending on the street light installation type.

Wood Poles:

The assessment of wood pole is based on the following criteria:

- Age
- Integrated Pole Maintenance Program (Regularly Scheduled Inspection/ Evaluation)
- Regularly Scheduled Visual Inspections

The AHI of wood poles is based upon the summary of the IPM program, as well as age.

In 1989, Manitoba Hydro implemented the Integrated Pole Maintenance program (IPM). The program is a designed to provide an accurate assessment of our wood poles on a 15 year cycle. Each pole receives a thorough inspection, strength evaluation, remedial treatments as required and attribute information is collected electronically. These remedial treatments are designed to provide the poles with added protection internally and externally to extend their service life.

Wood poles have a useful life expectancy of 75 years.

Appendix E: Endnotes

[1] Expected life is dependent on asset type: Mechanical (80-90 years), Analog/Digital (50/25 years).

[2] Expected life is dependent on asset type: Mechanical (100-125 years), Analog (45-55 years) and Digital (20-25 years).

[3] The expected life is dependent on loading and service type.

[4] Four (4) transmission system breakers have been replaced over the last ten years due to in service failures and nineteen (19) have been replaced or retired for system development or economic reasons.

[5] Reasons for replacement:

- 107 - 4kV and 12kV breakers were replaced due to safety and reliability concerns in early 2000s.
- All 46kV breakers were replaced.
- 43 of Dorsey's breakers upgraded in the early 90s due to insufficient capacity.
- One 500kV breaker replaced in 2010 due to condition,
- 15 of Dorsey's 230kV breakers are to be replaced by 2017 due to insufficient capacity.
- 31- 138kV breakers at Radisson are to be replaced around 2025 due to insufficient capacity.

[6] Costing of the breakers appears low because these numbers include 4, 12 and 46KV breakers.

[7] Station Battery Capacity & System Reliability Increase Program included 138 battery replacement projects since 2005. This program is expected to conclude in 2017.

[8] The expected life is dependent on loading and service type.

[9] Seven (7) transmission system transformers have been replaced over the last ten years due to in service failures and ten (10) have been removed from service as part of the Pointe Du Bois Transmission Redevelopment and Transcona East Station Projects.

[10] The expected life is dependent on loading and service type.

[11] Expected life is very dependent on device technology. Electromechanical devices have longer expected service performance than electronic devices. A key factor in end of life expectancy is obsolescence. Expected end of life is extended by ensuring adequate spare relays are retained after protection system upgrades.

[12] Three major programs have replaced 52 obsolete line teleprotection systems since 2005. The number of additional protection relay replacements or retirements completed as part of system improvement capital projects was not determined for this report.

[13] Close to 700 steel structures have been removed from service and/or replaced with new transmission infrastructure over the last 10 years. Additional partial structure replacements (e.g. footing replacements) are not reflected in this number.

[14] Slightly over 700 wood pole structures have been removed from service and/or replaced with new transmission infrastructure over the last 10 years. Additional partial structure replacements (e.g. individual poles or cross arms) are not reflected in this number.

[15] Approximately 350 km of three phase conductor has been removed from service and/or replaced with new transmission infrastructure over the last 10 years.

[16] Refurbishments to date have kept all original units in service.

[17] Refurbished one unit after failure, and it is retained as a spare.

[18] All units replaced in last four years when condition of old units dictated. New units are air core. This style has performed well in the filter positions, but has not been used in the smoothing reactor role before. Expected life and turn over are an estimate at present.

[19] The existing turnover rate is based upon the past 10 years of station breaker replacements. Due to a recognized need to increase system capacity as a result of customer demand, it is expected that station upgrade and replacement rates will dramatically increase in the near future which may result in reduced turnover rates.

[20] The expected life is dependent on loading and service type.

[21] The existing turnover rate is based upon the past 10 years of station transformers replacements. Due to a recognized need to increase system capacity as a result of customer demand, it is expected that station upgrade and replacement rates will dramatically increase in the near future which may result in reduced turnover rates.

[22] Expected life is dependent upon cable type: PILC (60-70 years), RINJ/RIPVCJ (30-40 years), XLPE/TRXLPE (40-50 years).

[23] Currently, no ductline replacement program exists as the life of the asset consistently outlasts that of the manholes they are connected to. Ductlines are rehabilitated or replaced when associated work in performed within the area in order to take advantage of the reduced costs of construction.

[24] Currently, no conductor replacement program exists as the life of the asset consistently outlasts that of the pole structure supporting it. Due to an increase in system capacity resulting from customer demand, overhead conductors are replaced as a result of capacity upgrades.

[25] Expected life is dependent upon installation method: direct install/power screw (50-60 years), concrete base (60-70 years).

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

FINANCIAL RESULTS & FORECASTS

5.0 OVERVIEW

Tab 5 provides explanations of the actual and forecast revenues and expenses related to Manitoba Hydro's Electric operations for 2012/13 to 2016/17, and outlines the significant year over year changes. Section 5.1 provides a summary of Manitoba Hydro's financial results and forecasts for 2012/13 to 2016/17, and Sections 5.2 to 5.13 discuss the revenue and cost components for 2012/13 to 2016/17. Section 5.14 outlines a number of initiatives that Manitoba Hydro is undertaking to reduce costs and ease pressures on financial results and rates.

The key conclusions with respect to Tab 5 are:

1. The requirement for the proposed rate increases are primarily being driven by the increased finance expense, depreciation and amortization expense and capital taxes associated with investment in new assets and reinvestment in existing assets.

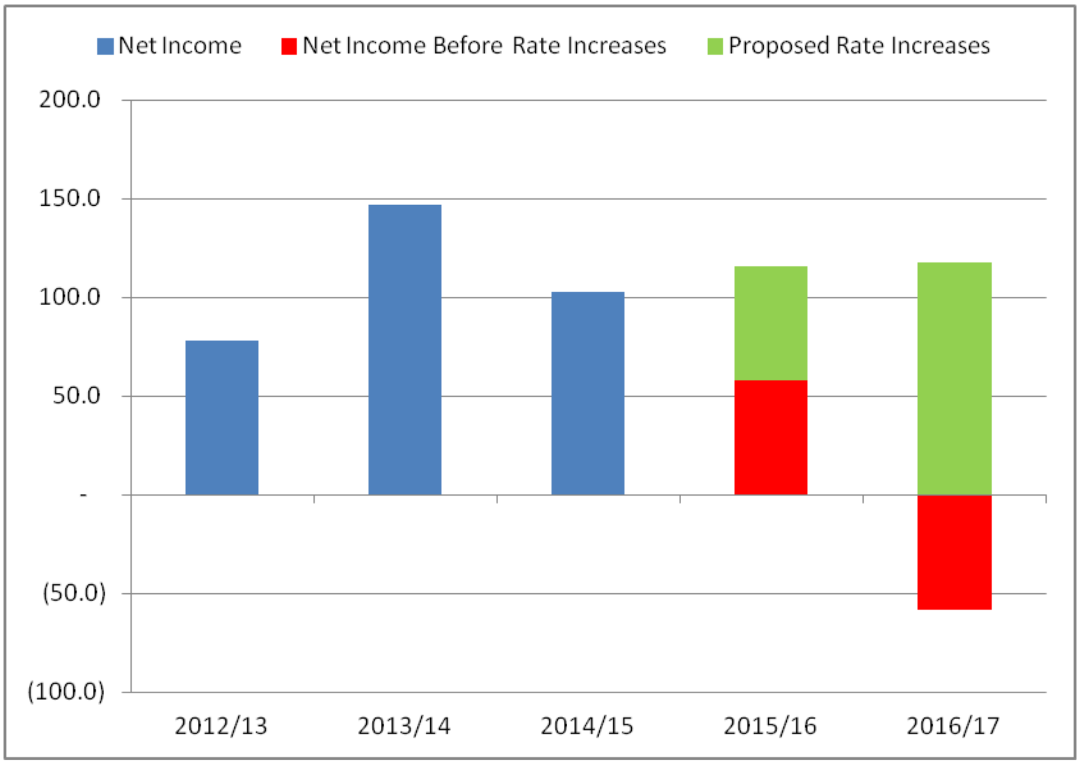
2. Manitoba Hydro is committed to effectively controlling its OM&A costs and has recently completed an extensive review of its staff compliment and is undertaking a number of initiatives across the Business Unit's to maintain OM&A cost increases at 1%, which is below inflationary levels (excluding accounting changes that impact OM&A).

3. While there are a number of prospective accounting changes being made for financial reporting purposes between 2014/15 and 2015/16 that will increase OM&A and decrease Depreciation and Amortization, these changes offset each other and are not driving the need for rate increases.

5.1 SUMMARY OF FINANCIAL RESULTS & FORECAST

Figure 5.1 provides a summary of actual and forecast net income for electric operations (excluding subsidiary operations) for 2012/13 to 2016/17. For 2015/16 and 2016/17, the red bars show Manitoba Hydro's net income/loss without the proposed rate increases and the green bars show the projected net income including the proposed rate increases.

Figure 5.1 Net income



The following schedule provides a breakdown of the Statement of Income.

MANITOBA HYDRO **Schedule 5.1.0**
STATEMENT OF INCOME **(000's)**

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast

Net income including rate increases	$ 78 036	$ 146 545	$ 102 317	$ 115 347	$ 59 397
Year over year $ change		$ 68 509	$ (44 228)	$ 13 030	$ (55 949)

*Non-controlling interest represents NCN's share of the net income/loss from WPLP.

2013/14 Actual vs. 2012/13 Actual

Net income from Electric operations increased in 2013/14 primarily as a result of higher extraprovincial revenue mainly due to increased generation from stations on the Nelson River due to higher flows, as well as higher general consumers revenue mainly due to colder winter weather, a rate increase and customer growth.

The increase in revenue was partially offset by an increase in fuel and power purchased primarily due to higher purchased volumes from the colder winter weather, an increase in depreciation and amortization expense attributable to new additions to plant and equipment coming into service, and an increase in operating, maintenance and administrative expense (OM&A) primarily due to higher pension and benefit costs related to changes in discount and mortality rates and greater employer contributions.

2014/15 Forecast vs. 2013/14 Actual

Net income from Electric operations is forecast to decrease in 2014/15 primarily as a result of lower extraprovincial revenue from lower US sales volumes largely due to transmission outages that restricted exports on the US transmission line during October and November 2014 and an increase in finance expense due to higher net interest on debt as assets go in-service and lower realized gains on the sinking fund and U.S. debt.

These reductions to net income are partially offset by lower fuel and power purchased primarily due to lower purchased volumes due to the assumption of normal winter weather and a year-over-year projected increase in hydraulic generation during the winter period .

2015/16 Forecast vs. 2014/15 Forecast

Net income from Electric operations is forecast to increase in 2015/16 primarily as a result of an increase in general consumers revenue mainly due to the proposed 3.95% rate increase effective April 1, 2015, as well as an increase in extraprovincial revenue mainly due to higher export prices.

The increase in revenue is partially offset by an increase in finance expense primarily due to new long term debt issues to finance the Corporation’s capital investment requirements, as well as interest rates that are projected to rise to more normalized levels, and increases in depreciation expense as a result of plant assets going into service. The net impact of accounting policy changes as a result of the transition to IFRS results in an overall reduction to net income. Please see Appendix 5.7 for additional information on the impact of accounting policy and estimate changes.

2016/17 Forecast vs. 2015/16 Forecast

Net income from Electric operations is forecast to decrease in 2016/17 primarily as a result of increases in the volumes of US off-peak purchases and increased thermal costs due to the assumption of average water flows in 2016/17 compared to median water flows in 2015/16 , an increase in finance expense primarily due to higher debt levels to finance the Corporation’s capital investment requirements as well as interest rates that are projected to rise to more normalized levels and an increase in depreciation and amortization as well as capital taxes primarily due to increased plant investment.

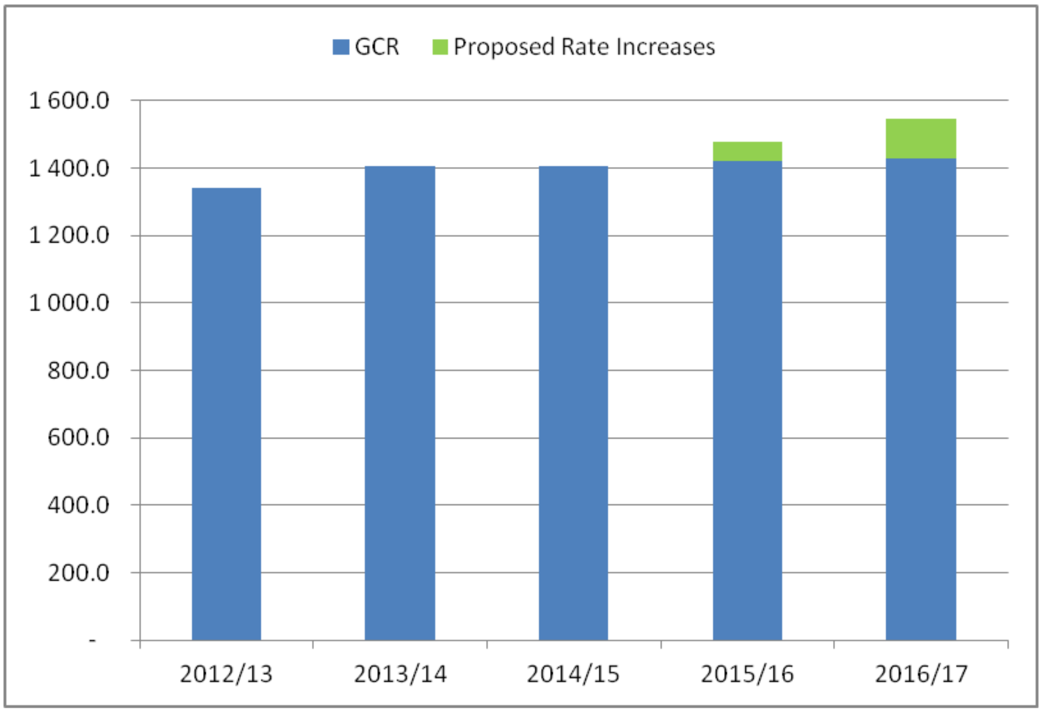
These reductions to net income are partially offset by an increase in general consumers revenue mainly due to the proposed 3.95% rate increase effective April 1, 2016, as well as an increase in extraprovincial revenue mainly due to a projected increase in export prices for Dependable and Opportunity Sales in 2016/17.

The following sections review each component of the Statement of Income. A description of each component, the year over year changes explanation and the detailed schedule is provided.

5.2 GENERAL CONSUMERS REVENUE

General consumers revenue ("GCR") is comprised of electricity sales to Manitoba Hydro's domestic customers as well as late payment charges. Customers are aggregated in two major rate classes – Residential and General Service (Commercial and Industrial customers and Area and Roadway Lighting). For 2015/16 and 2016/17, the blue bar in Figure 5.2 shows the GCR generated from existing rates and the green bar shows the additional revenues generated from the proposed rate increases.

Figure 5.2 General Consumers Revenue



The following schedule provides a breakdown of GCR.

MANITOBA HYDRO **Schedule 5.1.1**
GENERAL CONSUMERS REVENUE **(000's)**

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast
Residential	$ 562 959	$ 614 156	$ 597 916	$ 605 105	$ 612 761
General Service	778 052	809 971	838 826	849 283	847 486
Bipole III Reserve Account		(18 826)	(29 997)	(32 360)	(33 773)
Total Revenue excluding rate increases	1 341 011	1 405 301	1 406 745	1 422 028	1 426 474
Additional General Consumers Revenue*				57 377	117 638
Total Revenue including rate increases	$ 1 341 011	$ 1 405 301	$ 1 406 745	$ 1 479 405	$ 1 544 112
Year over year $ change		$ 64 290	$ 1 444	$ 72 660	$ 64 707
Year over year % change		4.8%	0.1%	5.2%	4.4%

* Additional General Consumers Revenue - 2015/16 and 2016/17 reflect rate increases of 3.95%

The Residential class is comprised of all housing types (single detached, duplexes, triplexes, etc.) and also includes individual metered apartment blocks, seasonal cottages and farm residences.

The General Service ("GS") class is comprised of commercial and industrial customers in the General Service Small, Medium and Large rate categories as well as Area and Roadway Lighting. Customers are classed as a GS Small if their connected load is less than 200 kV.A and their transformation is owned by Manitoba Hydro. Customers classed as GS Medium have connected loads which exceed 200 kV.A and whose transformation is also owned by Manitoba Hydro. GS Large customers have loads which typically exceed 2000 kV.A and who own their own transformation. The GS Large class is further divided into three sub-classes based on the voltage used to serve the customer (750V-30 kV, 30 kV-100 kV and >100 kV). The Area and Roadway Lighting class is comprised of all street lights and sentinel lights which may be publically or privately owned or rented.

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 increase is primarily due to higher consumption from colder winter weather, a rate increase, as well as customer growth. The PUB approved a rate increase of 3.5% effective May 1, 2013. The PUB directed that 2.0% of the 3.5% increase be included in general revenue and that 1.5% be set aside to mitigate rate increases when Bipole III is placed into service.

2014/15 Forecast vs. 2013/14 Actual

The forecast 2014/15 increase is primarily due to the 2.75% rate increase approved by the PUB on an interim basis effective May 1, 2014. The PUB directed that 2.0% of the 2.75% increase be included in general revenue and 0.75% be set aside to mitigate rate increases when Bipole III is placed into service. The revenue increase is partially offset by the assumption of normal weather conditions for 2014/15.

2015/16 Forecast vs. 2014/15 Forecast

The forecast 2015/16 increase is primarily due to the additional revenue associated with the proposed 3.95% rate increase effective April 1, 2015 as well as a 1.0% increase in energy consumption primarily due to growth in the Residential and General Service Large sectors.

2016/17 Forecast vs. 2015/16 Forecast

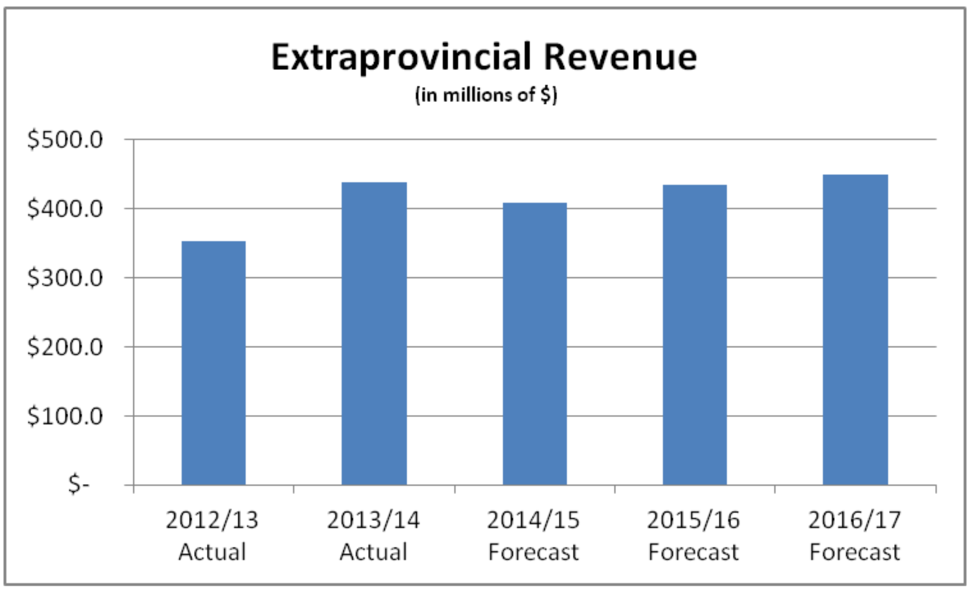
The forecast 2016/17 increase is primarily due to the additional revenue associated with the proposed 3.95% rate increase effective April 1, 2016 as well as load growth in the Residential sector. These increases are partially offset by a reduction in load in the General Service sector due to a Top Consumer phasing out a significant portion of their operation.

5.3 EXTRAPROVINCIAL REVENUE

Extraprovincial Revenue includes revenues from Canadian and US export sales as well as revenues from other associated export market activities such as merchant sales, transmission credits and renewable energy certificates.

Forecast Extraprovincial Revenues for 2014/15 are based on current storage conditions and expected inflows, assuming normal precipitation conditions for the remainder of the fiscal year. Revenues for 2015/16 are based on storage conditions carried forward from the prior fiscal year and median inflows. For the subsequent years, the projections are determined by averaging the revenues using the full range of experienced flow conditions.

Figure 5.3 Extraprovincial Revenue



Please see the following schedule for a breakdown of Extraprovincial Revenue.

MANITOBA HYDRO **Schedule 5.1.2**
EXTRAPROVINCIAL REVENUE **(000's)**

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast

Year over year % change		24.5%	-6.9%	6.2%	3.6%

*IESO = Independent Electricity Systems Operator and MISO = Midcontinent Independent System Operator

Please see the following for a description of Extraprovincial Revenue components:

Canadian and US Sales include both Dependable and Opportunity Sales.

Dependable sales are export contracts sourced from Manitoba Hydro’s dependable energy resources. Dependable energy resources are energy supplies assumed to be available in the event that the lowest recorded water supply conditions are repeated. Dependable sales involve capacity and energy commitments, are negotiated at least one year in advance of delivery, and have duration of greater than six months.

Sales not identified as Dependable are called Opportunity sales and can be sourced from non-dependable resources or uncommitted dependable resources:

- Opportunity (Bilateral) – Sales negotiated with a purchasing party and documented by contract or recorded exchange. The duration of delivery for these sales generally does not exceed 6 months, and can be as short as one-hour. Opportunity Bilateral sales can include the sale of capacity and/or energy.

- Opportunity (Day Ahead or Real Time Markets) – Export sales transactions in a market operated by an independent system operator for the purchase and sale of power related products for the next operating day ('Day Ahead') or during the operating day ('Real Time').

Merchant transactions represent arbitrage opportunities and are unrelated to Manitoba Hydro generation. These include physical purchases of power from one market for re-sale to another market.

Other Sales include miscellaneous revenues derived from market activities such as the sale of ancillary services into the Midcontinent Independent System Operator ("MISO") market and congestion management with the Ontario market.

Transmission Credits refer to revenues received for the use of Manitoba Hydro's transmission system. Manitoba Hydro' Open Access Transmission Tariff defines the fees for use of its transmission system. The MISO administers collection of these fees on behalf of Manitoba Hydro, which is why they are reported as US revenues.

Renewable Energy Certificates are revenues received mainly from the sale of environmental attributes acquired by Manitoba Hydro through power purchase agreements with wind generation suppliers in Manitoba.

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 increase reflects higher US sales volumes largely made possible by increased generation from stations on the Nelson River due to higher flows. Hydraulic generation was also higher in 2013/14 because the Wuskwatim Generating Station was in service for the entire year. Export revenues were also favourably impacted by an increase in merchant sales, higher market prices, and favourable foreign exchange rates on revenues from US sales.

2014/15 Forecast vs. 2013/14 Actual

The 2014/15 forecast decrease reflects lower US sales volumes largely due to transmission outages that restricted exports on the US transmission line during October and November 2014. Merchant sales are projected to be lower as Manitoba Hydro does not expect to have the same level of arbitrage opportunities between markets as was experienced in 2013/14. These decreases were partially offset by higher foreign exchange rates affecting revenues from US sales.

2015/16 Forecast vs. 2014/15 Forecast

The 2015/16 forecasted increase reflects higher export prices and a projected increase in foreign exchange rates on US sales. This increase is partially offset by lower Canadian sales volumes due to reduced participation in the IESO market and an expected decrease in merchant sales projected for 2015/16 due to reduced arbitrage opportunities between markets.

2016/17 Forecast vs. 2015/16 Forecast

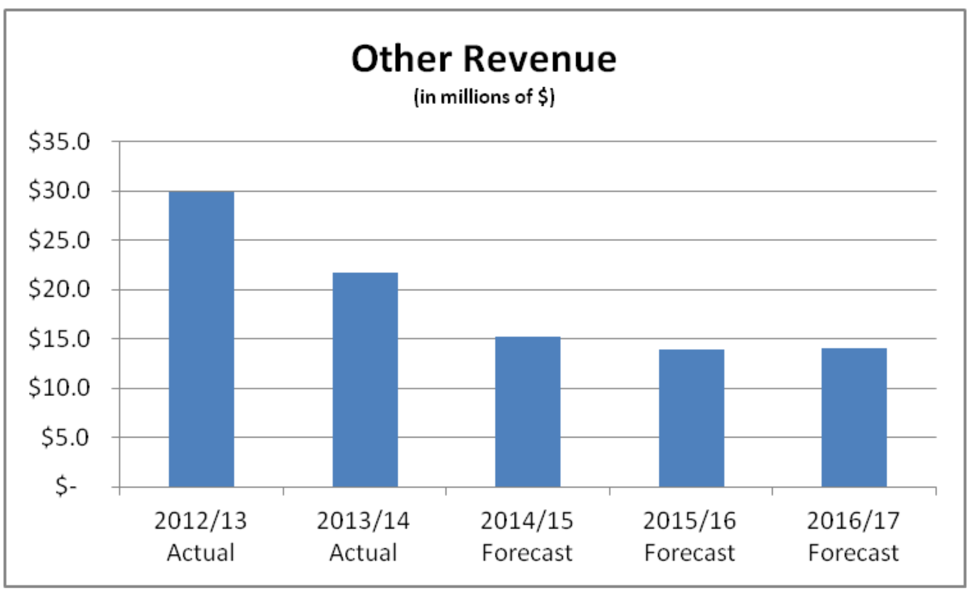
The 2016/17 forecasted increase is primarily due to an increase in prices of Dependable and Opportunity Sales. There are also additional firm export contract sales effective in 2016/17, further increasing the total export revenue compared to 2015/16. This includes the SaskPower 25-megawatt sale which is in effect for its first full year in 2016/17, increasing Canadian sales over 2015/16.

5.4 OTHER REVENUE

Other Revenue includes a variety of different revenue items, with the most significant items being:

- Joint Use contracts representing the net rental revenue between Manitoba Hydro and MTS, Cable TV and other utilities. Net revenue is the difference between gross revenue (attachments on Manitoba Hydro property) and gross billings (Manitoba Hydro attachments on external party property).
- Third party revenues where there is a provision of services for the use/rental of Manitoba Hydro owned assets.
- Revenues received for work the Corporation undertakes on customer owned plant on a fee-for-service basis.
- Electrical inspections performed by Manitoba Hydro on customer owned facilities.
- Gains on sale of land to external parties. Gains are calculated as the sale price less historical acquisition costs and costs of disposal.
- Miscellaneous Other Income which includes income items such as litigation settlements, apprenticeship tax credits, etc.

Figure 5.4 Other Revenue



MANITOBA HYDRO **Schedule 5.1.3**
OTHER REVENUE **(000's)**

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast
Other Revenue	$ 29 854	$ 21 758	$ 15 223	$ 13 870	$ 13 999
$ Change		$ (8 096)	$ (6 535)	$ (1 353)	$ 129
% Change		-27.1%	-30.0%	-8.9%	0.9%

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 decrease is primarily due to a reduction in gains on sale of land compared to 2012/13 as well as a reduction goods and services sold to outside parties compared to 2012/13.

2014/15 Forecast vs. 2013/14 Actual

The 2014/15 forecast decrease is partially due to gains on sale of land that occurred in 2013/14 and are not expected in 2014/15. In addition, there is a reduction in the amount forecast for third party work on customer owned assets.

2015/16 Forecast vs. 2014/15 Forecast

No significant change.

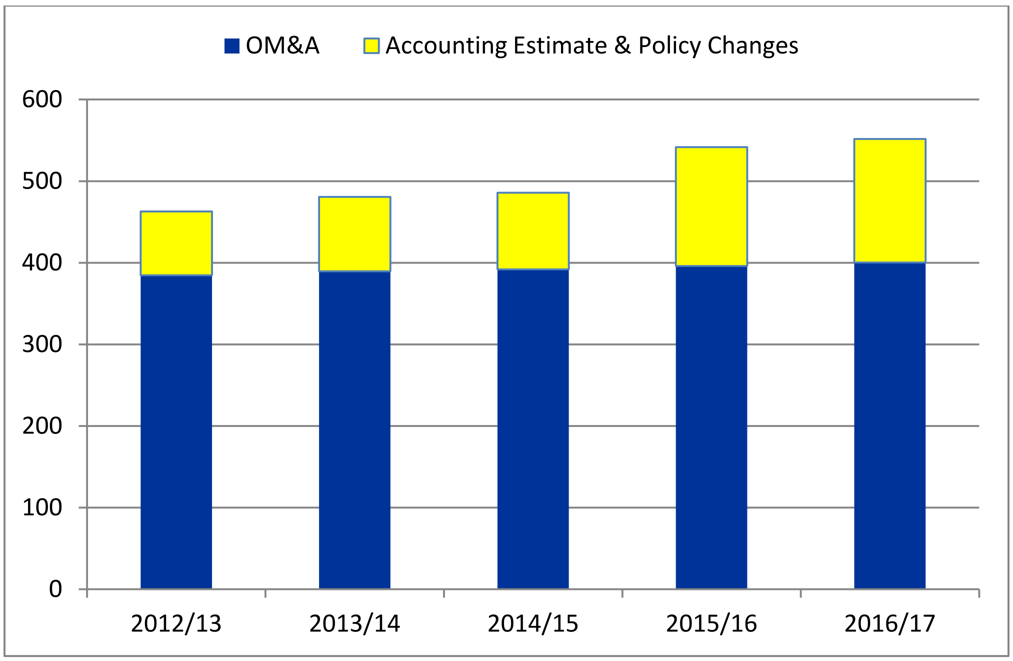
2016/17 Forecast vs. 2015/16 Forecast

No significant change.

5.5 OPERATING, MAINTENANCE & ADMINISTRATIVE

Operating, Maintenance & Administrative (OM&A) Expenses are comprised primarily of labour and benefits, materials, contracted services, and overhead costs associated with operating and maintaining all facilities of the Corporation and providing services to customers. Figure 5.5 provides a summary of OM&A expenses indicating the impact of accounting estimate and policy changes between 2012/13 and 2016/17, which are represented in yellow.

Figure 5.5 Operating, Maintenance & Administrative



The following table provides a breakdown of the OM&A expenses incorporating accounting changes:

Year over Year % Change, excluding Accounting Changes		**1.3%**	**0.6%**	**1.1%**	**1.1%**	**1.0%**

*Includes amounts capitalized through Overhead

The 4.6% average annual growth over the 5 year period is primarily a result of accounting changes. These changes include an increase in pension and benefit costs under CGAAP due to changes in the assumptions used to calculate these costs, such as changes in the discount rate and mortality tables. IFRS changes commence in 2015/16 and primarily impact capitalized overhead costs, which are no longer eligible for capitalization. While accounting changes under both CGAAP and IFRS have impacted OM&A costs, this is fully offset by reductions to depreciation and amortization expense. Please see Appendix 5.7 for more detailed information on the net impact of accounting changes in IFF14.

The average annual growth rate, excluding accounting changes, is 1.0%. The growth of 1.0% reflects higher wages and salaries due to contract settlements, merit and progression of approximately 3% to 4% annually, which is mainly offset by a concerted effort by Manitoba Hydro on cost containment, as further discussed in Section 5.14.

The cost containment strategy focuses on a comprehensive management of staff positions across all Business Units. The corporation continues to review work processes and functions to identify opportunities for the elimination of work no longer deemed essential, to consolidate similar functions where overlap may exist, and to implement changes which reduce costs and increase efficiencies. This review has resulted in a projected reduction of 300 operational EFTs which is discussed further in Appendix 5.5.

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 increase is primarily a result of accounting changes causing higher pension and benefit costs driven by changes in estimates for the discount rate and mortality rates.

2014/15 Forecast vs. 2013/14 Actual

The 2014/15 forecast increase is a result of contract wage settlements, which is mainly offset by the Corporation’s cost containment initiatives.

2015/16 Forecast vs. 2014/15 Forecast

The 2015/16 forecast increase is primarily attributable to IFRS accounting changes resulting in the requirement to expense $55 million of costs no longer eligible for capitalization. Excluding accounting changes, the forecasted increase in 2015/16 of 1.1% is a result of contract wage settlements, which is mainly offset by the Corporation’s cost containment initiatives.

2016/17 Forecast vs. 2015/16 Forecast

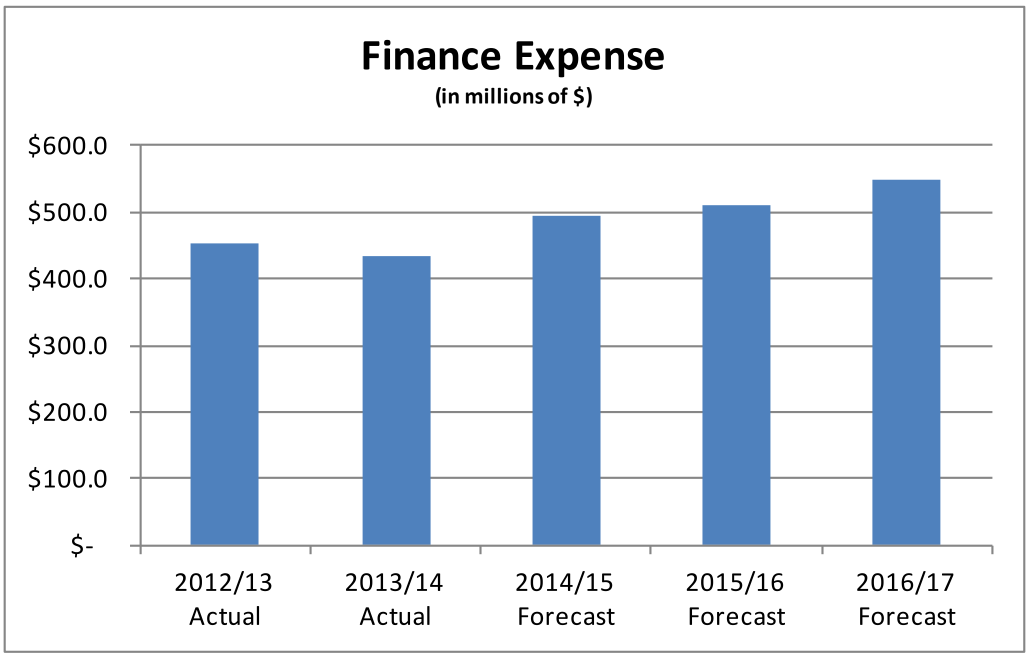
The 2016/17 forecast increase is primarily attributable to higher pension costs due to an increase in interest on the obligation and higher pensionable earnings. Excluding accounting changes, the forecasted increase in 2016/17 of 1.1% is the result of expected escalation in wages and salaries, mainly offset by the Corporation's cost containment initiatives.

Appendix 5.5 provides additional comprehensive information on Equivalent Full Time positions ("EFTs"), OM&A costs by category and Business Unit.

5.6 FINANCE EXPENSE

Finance expense consists of costs associated with the Corporation's financing activities. The largest component of finance expense is gross interest expense on the Corporation's debt portfolio. Finance expense is also affected or partially offset by a number of other components including: the debt guarantee fee; the amortization of discounts, premiums & transaction costs; the income or gains associated with the sinking fund and foreign exchange; and interest capitalized for capital projects under construction.

Figure 5.6 Finance Expense



The following schedule provides for a breakdown of Finance Expense.

MANITOBA HYDRO

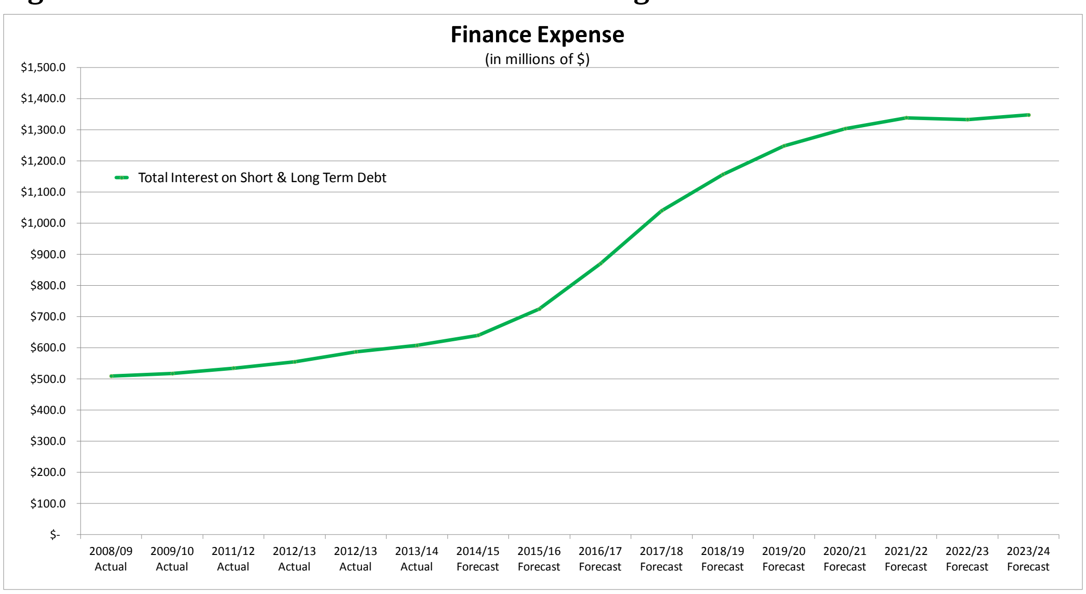
Year over year % change		-3.8%	13.7%	3.1%	7.3%

Manitoba Hydro is forecasting that in the next 10 years it will be necessary to fund the vast majority of its capital expenditures through debt financing. When combined with debt refinancing requirements, the total debt requirements for Manitoba Hydro's electric operations in the next five-year period will peak at levels in excess of $3 billion per year. These total forecast debt financing requirements are unprecedented in Manitoba Hydro's history. For finance expense, the total interest on short & long term debt is shown as the green line on the following figure:

Figure 5.7 Total Interest on Short-term & Long-term Debt



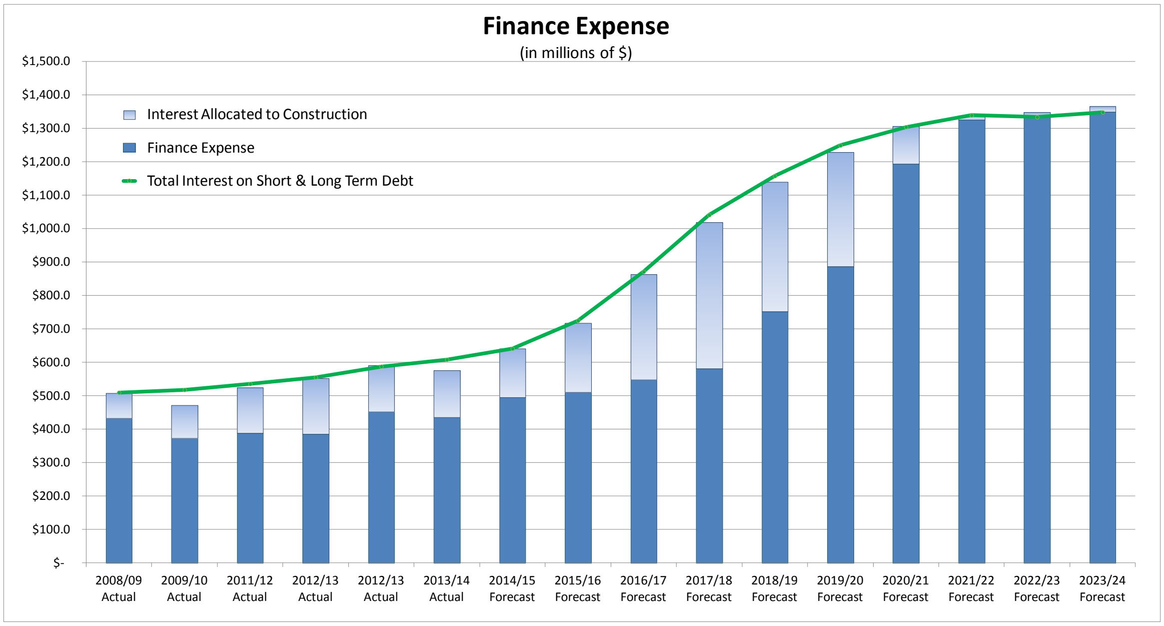
The components within this category are as follows:

- Gross Interest is the interest paid on Canadian and US dollar debt.
- The Provincial Guarantee Fee (PGF) is an annual fee payable to the Province of Manitoba in exchange for the guarantee of the Corporation's debt (with the exception of Manitoba Hydro-Electric Board Bonds) and is calculated using a rate of 1% multiplied by the applicable outstanding debt at March 31st of the previous fiscal year.
- The Amortization of Premiums, Discounts and Transaction Costs, arising from actual debt issuance on the existing debt portfolio are amortized over the term of the debt.
- The Intercompany Interest Receivable is primarily from the interest received from Manitoba Hydro's subsidiary, Centra Gas Manitoba Inc. ("Centra"), on the short and long term debt advances made to Centra from Manitoba Hydro. Interest rates for advances to Centra are based on the associated cost of financing that was incurred by Manitoba Hydro.

The actual and forecasted level of total interest on short & long term debt generally follows the growth in the size of the total debt portfolio financing the expansion of the Corporation's net capital assets. Commencing with 2015/16, the gross interest and PGF levels will begin to rise sharply in accordance with the escalation in capital financing, until 2021/21 when the overall levels flatten as capital investments subside.

The Interest Allocated to Construction is the interest capitalized during the construction of a project, which is a reduction to finance expense and a charge to the capital project. The interest associated with a capital project is not included in finance expense until the project is placed into service. As shown in the following figure, the interest allocated to construction (lightly shaded blue bars) is the primary factor that reduces the level of total interest on short & long term debt (green line) to arrive at net finance expense (dark blue bars) on the financial statements.

Figure 5.8 Finance Expense and Interest Allocated to Construction



Consequently, during periods of intensive capital construction, the net finance expense, and hence the revenue requirement, is temporarily shielded from the full weight of the gross finance expense by the interest allocated to construction. By 2021/22, as the level of capital investments subside, the net finance expense closely approaches the total interest on short and long term debt of over $1.3 billion per year.

In addition to the interest allocated to construction, there are a number of other components within finance expense as follows:

- The Interest Earned on Sinking Fund is primarily the interest recognized on Canadian and US sinking fund investments/ cash.
- The Realized Foreign Exchange (Gains) or Losses on Debt in Cash Flow Hedges, arising from the difference between the historic and market exchange rates on US dollar debt, are recorded in Finance Expense when hedged export revenues are realized.
- The Revaluation of Dual Currency Bonds is primarily a measure of the quarterly change in present value of the USD interest payments as translated into Canadian currency at the exchange rate prevailing at the balance sheet date.
- The Corporate Allocation amount includes the interest on the Centra acquisition debt and the related Provincial Guarantee Fee. This amount is included in the

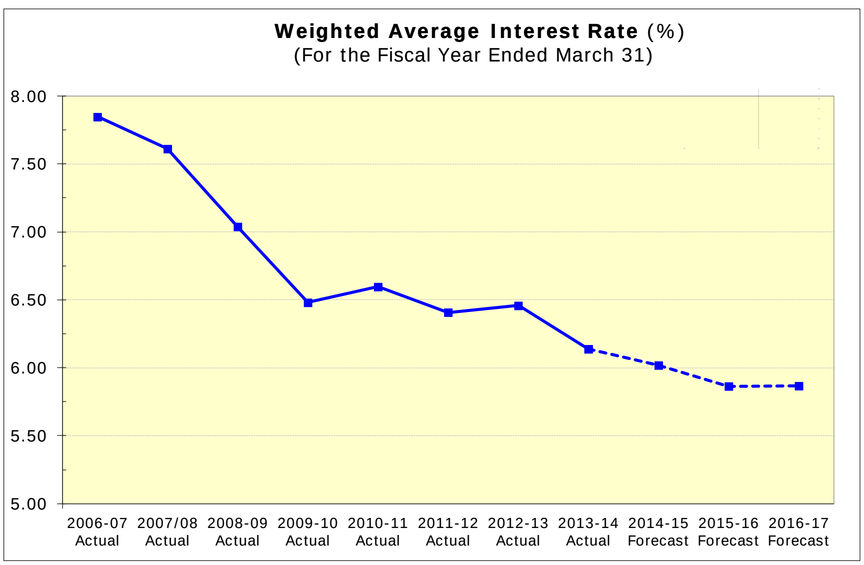
Corporate Allocation in Section 5.11.

- Other Amortization is primarily the amortization of the Winnipeg Hydro obligation and First Nations settlements.

While the forecasted increases in net finance expense primarily arise as capital assets go in-service and net finance expense is no longer reduced by the associated interest allocated to construction, gross interest expense arising from debt obligations will be affected by changing interest rates for new and refinanced debt requirements, as well as the debt portfolio's floating rate debt. Changing interest rates will also have a counterbalancing impact upon the interest capitalization rate used to derive the interest allocated to construction.

The low interest rate environment over the past few years has provided the opportunity for Manitoba Hydro to secure stable, low cost funding such that the weighted average interest rate on the debt portfolio has decreased. As shown on the following figure, since 2006/07, the debt portfolio's net weighted average interest rate has decreased by nearly 2.0%. It is anticipated that this positive trend will continue until leveling off in 2016/17.

Figure 5.9 Weighted Average Interest Rate



Although economic forecasts during the last few years have generally called for a quicker economic recovery and correspondingly higher interest rates, on an actual basis, the strength and pace of a recovery has been subdued. Manitoba Hydro will continue to monitor the financial markets, along with gathering the views of external economic forecasters in order to obtain the range and consensus forecast of their opinions.

The adverse interest rate risk associated with rising interest rates can be minimized through a series of actions such as:

a) reducing the level of variable (or floating) rate debt within the debt portfolio;
b) taking advantage of the historically low interest rate environment for long bonds by securing long term fixed rate financing as required; and
c) enhancing the stability of the debt portfolio by extending the weighted average term to maturity.

See the Debt Management Strategy in Appendix 3.7 for additional information regarding the Corporation's debt financing requirements and strategies.

It is also important to recognize that changes in the interest rate environment arising from macro-economic conditions may affect other aspects of Manitoba Hydro's operations and financial performance. For example, low interest rates may be correlated with low extra-provincial energy prices.

From a liquidity risk perspective, the significant differential between the Corporation's interest cash flow obligations (approximated by the green total interest on short & long term debt) and the accounting net finance expense contribution to revenue requirement (dark blue bars) will place addition pressure upon the Corporation's cash flow and interest coverage ratios.

In order to mitigate the foreign currency exchange risk on export revenues denominated in United States dollars (USD), Manitoba Hydro maintains a natural hedge with USD cash flows, including finance expense cash flows from US denominated debt. For example, to the extent that the underlying USD inflows and outflows are in balance, while a strengthening US dollar will increase the translation of US export revenues into Canadian dollars (CAD), this change will be offset by increases in the translation of US dollar expenses (such as US dollar interest expense) into CAD.

The following sections highlight the year-over-year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The decrease was primarily due to lower interest rates, higher realized foreign exchange gains on U.S. debt and higher recognized gains on the sale of U.S. sinking fund investments. This was partially offset by higher volumes of long term debt to finance capital expenditures and a weaker Canadian dollar.

2014/15 Forecast vs. 2013/14 Actual; 2015/16 Forecast vs. 2014/15 Forecast; and 2016/17 Forecast vs. 2015/16 Forecast

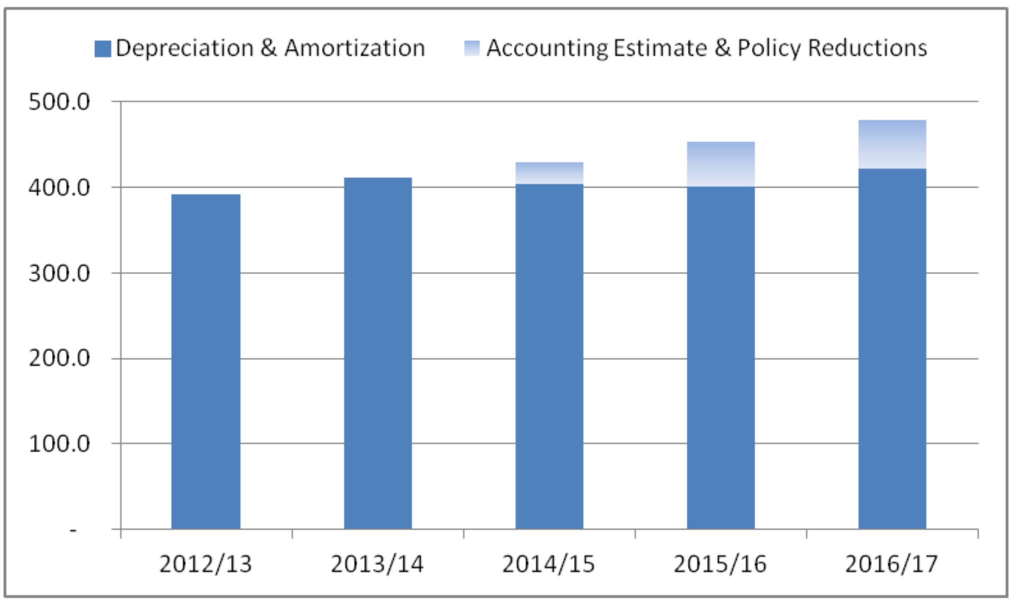
Gross interest expense increases during the forecast years, primarily due to new long term debt issued in finance the Corporation's capital investments as well as interest rates that are projected to rise to more normalized levels by the final forecast year. As a partial offset, any interest associated with funding capital projects under construction is capitalized, thereby reducing total finance expense.

5.7 DEPRECIATION & AMORTIZATION

Depreciation and Amortization expenses are calculated using a straight line remaining life basis. The asset categories include: Generation, Transmission, Distribution, and Other (General Equipment, Communication Equipment, Buildings, and Vehicles). Also included is the amortization of non-refundable customer contributions, regulated assets and intangible assets.

Figure 5.10 below shows the lower depreciation and amortization expense reflecting the change in estimate as a result of adjustments in asset service lives, removal of negative salvage from depreciation rates and the impact of the change in depreciation methodology.

Figure 5.10 Depreciation & Amortization



Please see the following schedule for a breakdown of Depreciation and Amortization.

Year over year % change Excluding Accounting Changes		**4.8%**	**4.5%**	**5.6%**	**5.7%**

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 increase is primarily due to new additions to plant and equipment coming into service, including the Wuskwatim Generating Station which was fully in-service during the 2013/14 fiscal year.

2014/15 Forecast vs. 2013/14 Actual

Fiscal 2014/15 reflects an increase in depreciation expense as a result of $1.7 billion in assets going into service. Of the $1.7 billion in additions, approximately $1.0 billion is comprised of new generation and transmission projects including the Pointe du Bois Spillway Replacement ($477 million), the Riel 230/500 KV Station ($329 million), and Bipole III Converter Station ($123 million), with $576 million comprised of sustaining capital investments.

The increase in depreciation expense as a result of plant additions is more than offset by the impact of new depreciation rates implemented by Manitoba Hydro. The new depreciation rates were determined as part of Manitoba Hydro's most recent depreciation study and reflect new service life estimates effective April 1, 2014.

Please see Appendix 5.6 for a discussion of the depreciation study and the associated depreciation rates and for correspondence from Gannett Fleming, Inc. setting out the depreciation rates to be used under GAAP and IFRS.

2015/16 Forecast vs. 2014/15 Forecast

Similar to the results reflected in the 2014/15 forecast, depreciation continues to increase as result of $833 million in plant assets going into service in the 2015/16 fiscal period. The majority of the assets forecast to go into service are comprised of sustaining capital investments of $593 million.

Overall depreciation decreases as a result of changes implemented by Manitoba Hydro in order to comply with the financial reporting requirements of IFRS. These changes include the removal of the provision for asset retirement costs from depreciation rates, the removal of administrative overhead from inclusion in the cost of capital projects, and the change in method of depreciation. The removal of the provision for asset retirement costs and the removal of administrative overhead from the cost of capital projects resulted in a decrease in depreciation expense totaling $60 million that was partially offset by a $36 million increase caused by the change in method of depreciation.

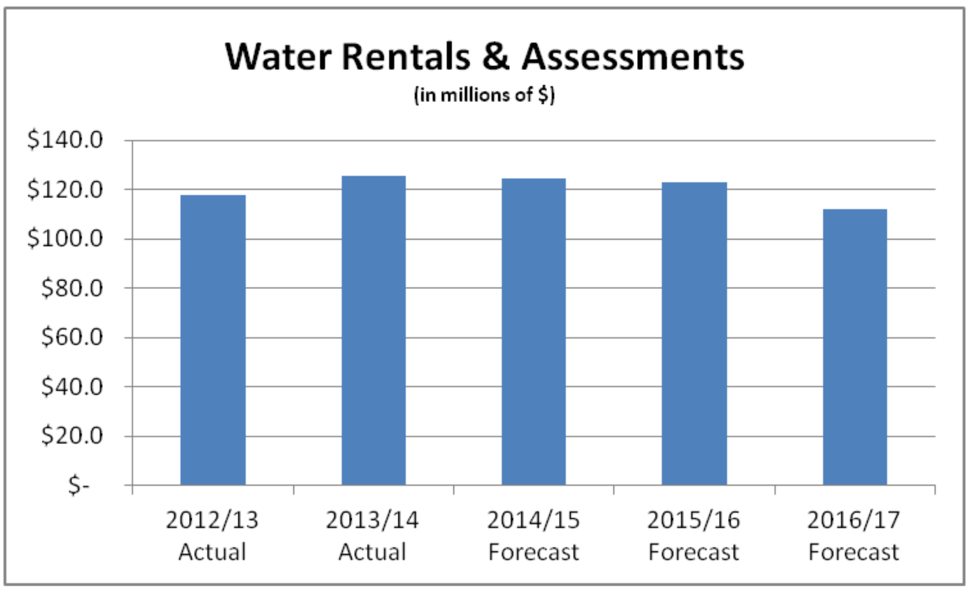
2016/17 Forecast vs. 2015/16 Forecast

The $21 million increase forecasted in 2016/17 is the result of $0.9 billion of assets going into service in fiscal 2016/17 (comprised of $692 million in sustaining capital investments), as well as the projected commencement of the amortization of deferred Conawapa project costs. For purposes of MH14, it is assumed that the deferred Conawapa costs are treated as a rate-regulated asset beginning in 2016/17.

5.8 WATER RENTALS & ASSESSMENTS

Pursuant to *The Water Power Act*, water rentals are paid to the Province for the use of water resources for hydroelectric generation. Assessments include amounts paid for water usage pursuant to *The Water Rights Act*, Lake of the Woods Control Board and Lac Seul Operating Costs, National Energy Board (NEB) assessments, and membership fees for MISO and other industry associations. Land rentals are annual payments for the use of Manitoba Crown lands used for water power purposes, as set out in Manitoba Hydro's Water Power Act licenses.

Figure 5.11 Water Rentals & Assessments



Please see the following schedule for a breakdown of Water Rentals and Assessments.

MANITOBA HYDRO **Schedule 5.1.7**
WATER RENTALS AND ASSESSMENTS **(000's)**

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast
Water Rentals	$ 110 440	$ 117 907	$ 117 417	$ 115 049	$ 103 902
Assessments & Land Rentals	7 424	7 610	7 052	7 798	8 265
Total Water Rentals and Assessments	$ 117 864	$ 125 517	$ 124 469	$ 122 847	$ 112 167
Year over year $ change		$ 7 653	$ (1 047)	$ (1 622)	$ (10 680)
Year over year % change		6.5%	-0.8%	-1.3%	-8.7%

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 increase is primarily due to increased water rentals due to an increase in hydraulic generation along the Nelson River as a result of higher system inflows compared to 2012/13. Also, the Wuskwatim Generating Station was in service for the entire year which contributed to the increase in the total water rental cost for 2013/14.

2014/15 Forecast vs. 2013/14 Actual

The 2014/15 forecast decrease reflects lower hydraulic generation largely due to transmission outages that restricted exports on the US transmission line during October and November 2014.

2015/16 Forecast vs. 2014/15 Forecast

The 2015/16 forecast decrease reflects lower hydraulic generation due to assumed median inflow conditions as compared to above average inflow conditions that occurred in 2014/15. Although lower than 2014/15, hydraulic generation is still expected to be above average due to significant carry over storage from 2014/15. The decrease in water rentals is expected to be partially offset by higher membership fees and assessments due to an increase in NEB charges.

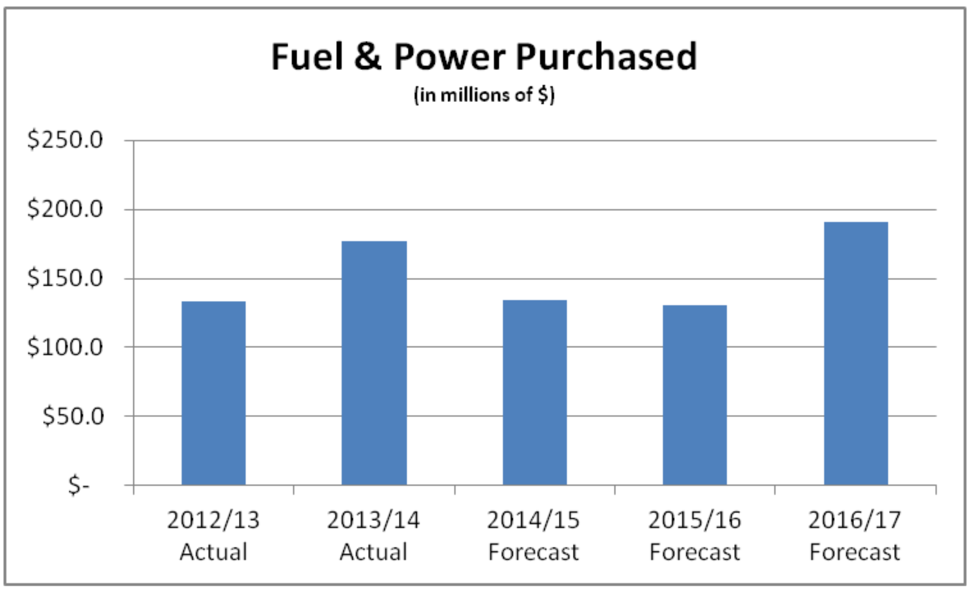
2016/17 Forecast vs. 2015/16 Forecast

The 2016/17 forecast decrease reflects lower water rentals due to lower hydraulic generation based on the assumption of average historic water flow conditions. Hydraulic generation, and therefore water rentals, is expected to be higher in 2015/16 primarily because of carry forward storage from the prior year.

5.9 FUEL & POWER PURCHASED

Fuel & Power Purchased includes costs of fuel for thermal generation facilities, costs for purchased energy, and other miscellaneous costs associated with export and import market activities and system operation. In 2014/15, over 99% of electricity forecast to be generated by Manitoba Hydro is from its 15 hydraulic generating stations and less than 1% from its two thermal generation stations and four remote diesel generation facilities. In addition, Manitoba Hydro purchases wind power from the independently-owned St. Leon and St. Joseph wind farms. Manitoba Hydro also imports electricity depending on the operating and economic circumstances.

Figure 5.12 Fuel & Power Purchased



Please see the following schedule for a breakdown of Fuel & Power Purchased.

MANITOBA HYDRO **Schedule 5.1.8**
FUEL AND POWER PURCHASED **(000's)**

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast
Thermal Fuel					
Coal	$ 3 305	$ 4 886	$ 3 566	$ 3 086	$ 6 329
Natural Gas & Other	9 012	9 183	9 262	10 574	21 542
Power Purchased	70 965	98 104	70 996	73 651	115 049
Merchant Purchases	5 366	18 863	7 407	5 705	-
Transmission Charges	44 644	46 078	42 958	37 416	48 013
Total Fuel and Power Purchased	$ 133 292	$ 177 113	$ 134 189	$ 130 432	$ 190 933
Year over year $ change		$ 43 821	$ (42 925)	$ (3 757)	$ 60 501
Year over year % change		32.9%	-24.2%	-2.8%	46.4%

Please see the following for a description of Fuel & Power Purchased components:

Coal purchases refers to the charge for coal consumed as the principal fuel for Brandon Unit 5 for the purpose of generating electricity under restricted operations.

Natural Gas & Other includes natural gas, oil and diesel requirements for Brandon and Selkirk, and diesel for remote locations for the purpose of generating electricity.

Power Purchased includes purchases of electrical energy from wind farms in Manitoba as well as from external Canadian and US suppliers.

Merchant purchases represent arbitrage opportunities and are unrelated to Manitoba Hydro generation. These include physical purchases of power from one market for re-sale to another market.

Transmission Charges relate primarily to reservation fees for use of transmission facilities for imports or exports, or for merchant transactions.

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 increase was primarily the result of higher purchased volumes due to colder weather during the winter of 2013/14. Merchant purchases were also higher in 2013/14 due to increased arbitrage opportunities between markets.

2014/15 Forecast vs. 2013/14 Actual

The 2014/15 forecast decrease is primarily the result of lower purchased volumes due to the assumption of normal weather and a year-over-year projected increase in hydraulic generation during the winter period. Merchant purchases are also projected to be lower in 2014/15 as Manitoba Hydro does not expect to have the same level of arbitrage opportunities between markets as was experienced in 2013/14. Transmission charges are also projected to be lower largely because of 100 MW of transmission service expiring in the third quarter of 2014/15.

2015/16 Forecast vs. 2014/15 Forecast

The 2015/16 forecast decrease is the result of reduced merchant purchases due to less arbitrage opportunities forecast for 2015/16. Transmission charges are also reduced because of a 100 MW transmission service that expired towards the end of 2014/15, with the effect being fully realized in 2015/16. These reductions are partially offset by an increase in off-peak imports as a consequence of reduced hydraulic generation.

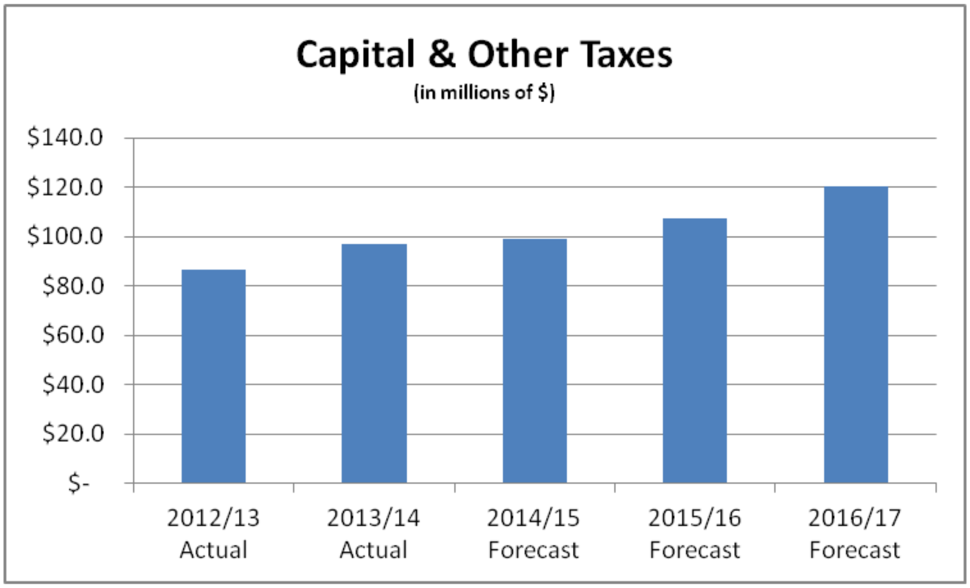
2016/17 Forecast vs. 2015/16 Forecast

The 2016/17 forecast increase is primarily due to increases in the volumes of US off-peak purchases and increased thermal costs. These increases are largely because the 2016/17 forecast reflects average purchases and costs based on the full range of historic flows with consideration for drought included, whereas 2015/16 is based on hydraulic generation from median inflows coupled with above average carry forward storage from 2014/15. Transmission charges are projected to increase due to 200 MW of new transmission service as of November 1, 2016.

5.10 CAPITAL & OTHER TAXES

Capital and Other Taxes is comprised of payments made to the Province of Manitoba for capital and payroll taxes as well as grants in lieu of taxes (“grants in lieu”), and business and property taxes paid to the various municipalities in Manitoba.

Figure 5.13 Capital & Other Taxes



The following schedule provides a breakdown of Capital and Other Taxes.

MANITOBA HYDRO | **Schedule 5.1.9**
CAPITAL AND OTHER TAXES | **(000's)**

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast
Capital Tax	$ 54 948	$ 59 780	$ 63 605	$ 70 408	$ 82 726
Grants in Lieu of Taxes	13 115	13 851	14 383	14 807	15 245
Payroll Tax	10 767	11 039	11 517	11 933	12 172
Business & Property Tax	1 174	1 152	1 165	1 168	1 197
Other Municipal Payments	6 395	7 612	8 500	8 840	9 194
GST Reassessment on City Tax	-	3 316	-	-	-
Total Capital & Other Taxes	$ 86 399	$ 96 750	$ 99 170	$ 107 156	$ 120 534
Year over year $ change		$ 10 351	$ 2 420	$ 7 986	$ 13 378
Year over year % change		12.0%	2.5%	8.1%	12.5%

The following provides a description of Capital & Other Tax components:

The Corporation pays capital tax to the Province of Manitoba at a rate of 0.5% and is applied to the taxable capital of the company.

The Corporation pays grants in lieu on its land and buildings. The amount of grants in lieu paid is determined based on property valuations and municipal and school division mill rates, similar to the manner in which property taxes are determined for other tax payers in Manitoba.

Payroll tax is based on a tax rate of 2.15% which is applied to the Corporation's gross payroll. A portion of the payroll taxes paid is allocated to Centra based on the relative percentage of activity charges to gas programs.

Business taxes are paid with respect to commercial space occupied by the company in both leased and owned properties. The Corporation pays property taxes to the landlords of leased premises as part of the required lease payments.

The Corporation also makes other municipal payments with respect to the town of Gillam and the Frontier School Division.

The Canada Revenue Agency ("CRA") performed an audit with respect to an issue regarding GST being charged to customers. It was determined that the GST should be applied to the City of Winnipeg tax charged to customers. In 2013/14 the Corporation was assessed, and accrued for, past taxes not collected from customers in the amount of $3.3 million.

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 increase is higher than expected partially due to the inclusion of the $3.3 million Canada Revenue Agency GST audit reassessment. The remainder of the increase is largely driven by the increase in provincial capital tax which is linked to increasing debt levels to fund capital investments. Other municipal payments have also increased at a rate higher than inflation due to increased funding requirements relating to the town of Gillam.

2014/15 Forecast vs. 2013/14 Actual

The forecast 2014/15 increase is primarily due to higher capital taxes. Going forward, all years will be impacted by capital taxes increasing at greater than the rate of inflation due to higher capital investment increasing debt levels. Other municipal payments relating to the town of Gillam also continue to increase due to operational funding needs.

2015/16 Forecast vs. 2014/15 Forecast

Capital tax is higher due to increased capital spending for Keeyask, Bipole III and aging infrastructure. All other items are forecast to generally increase in line with inflation.

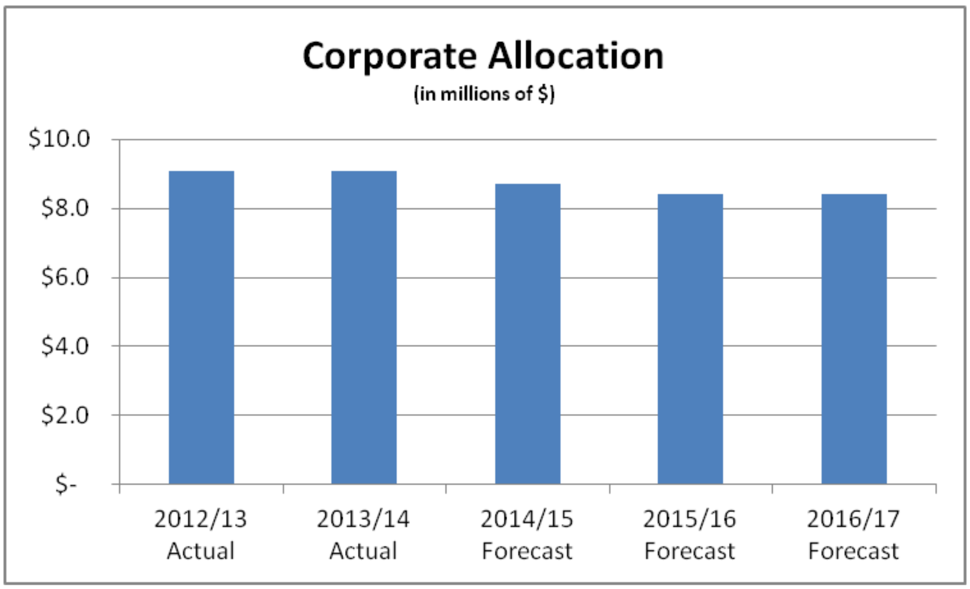
2016/17 Forecast vs. 2015/16 Forecast

Capital tax is higher due to increased capital spending for Keeyask, Bipole III and aging infrastructure. All other items are forecast to generally increase in line with inflation.

5.11 CORPORATE ALLOCATION

Corporate Allocation includes Manitoba Hydro Electric operations' share of the acquisition costs relating to Centra. The total annual acquisition cost of Centra includes the interest and provincial guarantee fee ("PGF") on the acquisition debt, and the amortization of the acquisition and integration costs. The total ranges from $20 to $21 million annually. Of this amount, $12 million is charged to the natural gas operations. The remainder is charged to Electric operations.

Figure 5.14 Corporate Allocation



Please see the following schedule for a breakdown of Corporate Allocation.

The following sections highlight the year over year changes from 2012/13 through 2016/17.

2013/14 Actual vs. 2012/13 Actual

No significant change.

2014/15 Forecast vs. 2013/14 Actual

The 2014/15 forecast decrease is primarily due to lower interest rates from refinancing the Centra acquisition debt.

2014/15 Forecast vs. 2015/16 Forecast

The 2015/16 forecast decrease is primarily due to a full year of lower interest rates from the previous year's refinancing.

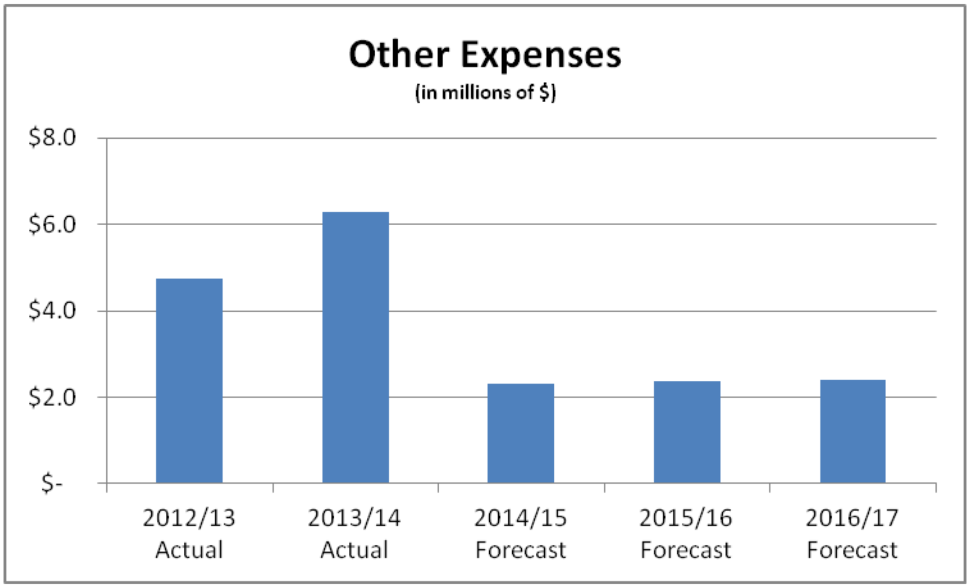
2016/17 Forecast vs. 2015/16 Forecast

No significant change.

5.12 OTHER EXPENSES

Other expenses include costs associated with the provision of work on customer owned plant and other miscellaneous expenditures.

Figure 5.15 Other Expenses



MANITOBA HYDRO | **Schedule 5.1.11**
OTHER EXPENSES | **(000's)**

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast
Other Expenses	$ 4 750	$ 6 294	$ 2 311	$ 2 355	$ 2 402
$ Change		$ 1 544	$ (3 983)	$ 44	$ 47
% Change		32.5%	-63.3%	1.9%	2.0%

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 increase is the primarily the result of a one-time write off of property, plant and equipment under construction.

2014/15 Forecast vs. 2013/14 Actual

The decrease in expenses results from the one-time write-off in 2013/14.

2015/16 Forecast vs. 2014/15 Forecast

No significant change.

2016/17 Forecast vs. 2015/16 Forecast

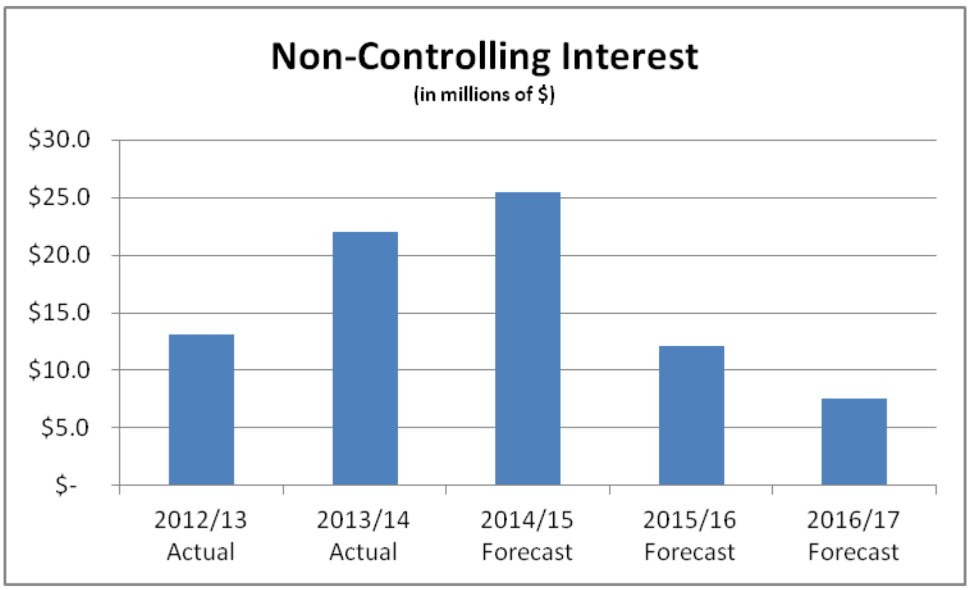
No significant change.

5.13 NON-CONTROLLING INTEREST

The Wuskwatim Power Limited Partnership ("WPLP") has two limited partners, Manitoba Hydro and Taskinigahp Power Corporation ("TPC") which is beneficially owned by Nisichawayasihk Cree Nation ("NCN") and a General Partner which is a wholly-owned subsidiary of Manitoba Hydro. NCN may acquire up to a 33% interest in WPLP. The generating station and associated transmission was placed into service during the 2012/13 year. Manitoba Hydro will operate and maintain the Wuskwatim generating station and purchase all of the output under the power purchase agreement with WPLP.

Manitoba Hydro's income statement includes all of the WPLP revenues and expenses. TPC's 33% portion of the operating results of the WPLP is recorded as non-controlling interest in the consolidated statement of income.

Figure 5.16 Non-Controlling Interest



MANITOBA HYDRO | **Schedule 5.1.12**
NON-CONTROLLING INTEREST | **(000's)**

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast
Non-controlling Interest	$ 13 160	$ 22 005	$ 25 452	$ 12 126	$ 7 580
$ Change		$ 8 845	$ 3 447	$ (13 326)	$ (4 546)
% Change		67.2%	15.7%	-52.4%	-37.5%

The following sections highlight the year over year changes from 2012/13 through 2016/17:

2013/14 Actual vs. 2012/13 Actual

The 2013/14 increase reflects the first full year of operations for the WPLP as the first of three units at the Wuskwatim generating station entered commercial service in June 2012.

2014/15 Forecast vs. 2013/14 Actual

The 2014/15 forecast increase results from the projection of lower revenues due to reduced forecast volumes and lower projected export prices and higher finance expense than recorded in 2013/14.

2015/16 Forecast vs. 2014/15 Forecast & 2016/17 Forecast vs. 2015/16 Forecast

Manitoba Hydro and NCN have reached an agreement in principle with respect to the majority of terms within the Wuskwatim Project Development Agreement (PDA). The parties are still reviewing and negotiating the final terms of the PDA. The draft terms contained in the PDA related to the power purchase agreement between Manitoba Hydro and the WPLP improve the financial results of the partnership and as a result, reduce the loss that is allocated to TCP through non-controlling interest.

5.14 COST SAVING INTIATIVES

Manitoba Hydro continues to undertake a number of initiatives that are intended to result in both operating and capital cost savings, ultimately improving financial results and easing pressures on rates. These initiatives support the Corporation's commitment to manage its OM&A expenditures below inflationary levels and support Manitoba Hydro's debt management strategy by reducing capital investment resulting in lower overall debt & depreciation requirements.

OM&A cost increases have been limited to 1% per year up to 2021/22 (excluding accounting changes and the increases associated with new major generation and transmission projects coming into service). After 2021/22, OM&A is projected to rise at the same level as inflation, despite the increasing cost pressures facing the Corporation from investments required for infrastructure renewal and increased capacity.

The following describes some of the key ongoing initiatives being undertaken by the corporation to manage its overall operating and capital expenditures.

5.14.1 Reduction of Operational Positions

Over the forecast period (2014/15 through 2016/17), Manitoba Hydro has committed to a reduction of approximately 300 operational positions and a commitment to hold non-labor costs below inflation, where possible. Manitoba Hydro intends to leverage its current attrition rate of approximately 300 staff per year by analyzing work processes and functions to identify opportunities for elimination, consolidation or technology enhancements that will result in staff reductions and efficiencies while still maintaining service levels. The reductions will vary across the corporation and are dependent upon the review of the many varied processes and functions unique to each area.

5.14.2 Consolidation of Rural District Offices

This initiative entails the closure of 24 rural district offices and their consolidation into the existing 20 Customer Service Centres. This effort is expected to enhance customer service through improved field crew deployment from the recently implemented Mobile Workforce Management System, improve system reliability by increasing distribution maintenance efforts and economize on customer-based administrative tasks.

Consolidation of the rural district offices is expected to yield a reduction in operating costs of approximately $2 million per year and result in the avoidance of future facility upgrade expenditures of $50 million and potential sales revenue of vacated properties. The first stage of facilities closures began in January 2014. The timing of this initiative is a result of declining district office traffic, increased customer demand for on-line services and increased customer requests at the previously established customer service centre hubs. This initiative is expected to maintain or improve outage response times.

Opportunities are also being derived in the centralizing of administrative work processes at Customer Service Centres. Amalgamating district staff into the larger Customer Service Centres has enabled Manitoba Hydro to create a more specialized and flexible workforce that is better equipped to respond to service disruptions. The Corporation also continues to monitor service levels and explore opportunities to optimize customer service, particularly in the areas of self-service and web-based outage information.

5.14.3 Managing Contractor Costs in Various Projects

The management of costs for capital projects involves proactively managing the schedule, scope and risks to the project. Manitoba Hydro has put in place industry standard project controls such as frequent schedule and cost monitoring with a focus on understanding the past and current costs. Manitoba Hydro is implementing a number of strategies throughout the lifecycle of major projects such as Bipole III and Keeyask.

For the procurement process, Manitoba Hydro has generally been following a multi-stage process where proponents are initially prequalified on their ability to complete the construction work, with pre-qualified proponents then competing largely on price to maximize competitiveness of the process and determine the successful proponent. In some instances, the work is awarded as a fixed price and pre-qualified proponents have input into finalization of contractual terms during the proposal phase, which balances risk between Manitoba Hydro and the proponents and reduces the overall uncertainty in the bids. The result was that proponents were able to reduce the amount of risk dollars carried in their bids, reducing overall bid price. In some instances, Manitoba Hydro informed all proponents that commercial and technical alternatives that may offer cost savings while still meeting the requirements of the contract would be considered resulting in noticeable cost savings.

5.14.4 Review of the Gillam Redevelopment and Expansion Project (GREP)

Manitoba Hydro undertook a review of the Gillam Redevelopment and Expansion Project (GREP) which involved assessing changing business requirements and developing a strategy that reflected these changes while applying the most current northern community design practices.

The revised community development plan incorporated a number of modifications including: eliminating expansion of infrastructure while strengthening community through enhanced centralized amenities, eliminating further expansion of new retail/commercial space, cancelling construction of a new 75 single detached unit housing subdivision substantially reducing the number of additional residential sub-divisions and new housing units, limiting/eliminating expansion of the existing trailer court sub-division, and cancelling construction of a new Wellness Centre.

In place of these developments, Manitoba Hydro's current plan is to expand mid-density housing within existing infrastructure, and upgrade and enhance recreation and leisure facilities in the Town Centre. The result of this assessment and strategy is a community plan with amenities intended to attract and retain Manitoba Hydro staff in Gillam and a cost savings of approximately $100 million.

5.14.5 Pointe du Bois Operations Spillway Cost Efficiencies

The Pointe du Bois Spillway Project was initiated to update the original spillway in order to meet current dam safety guidelines. The new spillway was placed into service in August 2014. River control has been a continuous challenge for Pointe du Bois Operations over the years due to constant river fluctuation.

The requirement to melt ice off the gates was a manual and very labour intensive process, requiring a crew of almost nine staff to operate the boilers. In addition, the original spillway was not designed to handle the pressure of shifting or expanding ice, and term employees were required to monitor ice thickness and cut trenches in front of the spillway structure.

As a result of the spillway replacement, Manitoba Hydro will see a reduction in OM&A costs. The in-service of the new spillway will result in an immediate and permanent reduction of approximately 1 EFT. In addition, the requirement for utility staff to be on call at all times has been eliminated with the ability to remotely control the river. Finally, the new spillway eliminates the need for boiler operation for melting ice and as a result the 9 positions held by Power Engineers have been deemed redundant.

It is estimated the Pointe du Bois spillway replacement will result in approximately $1 million in cost savings. In addition, the Pointe du Bois spillway structure replacement has resulted in a safer working environment for employees, through the ability to remote control operation.

5.14.6 Implementation of Mobile Workforce Management

Manitoba Hydro has implemented a new mobile workforce management system to effectively manage field activities for both the electric and natural gas businesses. This technology permits the planning, scheduling and dispatching of work orders in an optimized manner to derive cost efficiencies and timely service to customers. Rather than organizing work using geographic specific paper systems, field labour crews are now managed through a scheduling/dispatch centre with the ability to deploy field crews to emergency and urgent customer requests at the same time as improving the throughput of pre-scheduled maintenance work.

Work assignments are now sent to field laptop units electronically where activity details are entered in real time as the work progresses. Customer information and maintenance history are also readily available to field crews and electronic drawings can be retrieved within the vehicle. These field units are also equipped with GPS systems to identify the work locations of all crews.

The benefits of this initiative to customers include an improved ability to schedule appointments with shorter wait times and in precise time slots, improved timeliness of work flow, and the ability to track work orders. The system is also intended to result in faster response times in the event of emergencies. The implementation of mobile workforce management continues to permit the reduction of positions. To date 16 administrative positions have been eliminated and approximately four more positions each year for the next two years are identified for reduction. Field crew productivity savings are also expected due to reduced travel time and standardized matching of skills to job tasks, as well as the ability to complete greater volumes of maintenance work without increasing internal staffing requirements.

Adherence to stringent maintenance schedules is one way to prolong the life of Manitoba Hydro's aging and deteriorating distribution assets. Mobile workforce management has allowed Manitoba Hydro to meet its prescribed facility maintenance requirements, which in turn has helped to modestly relieve some pressure on advancing capital funding to replace distribution assets and also maintain existing levels of electric service reliability.

5.14.7 Asset Management Strategies

Manitoba Hydro is facing cost pressures associated with an aging electric infrastructure. In an ongoing effort to reduce expenditures, the Corporation has been undertaking a number of strategies to reduce overall costs on the electric system equipment while properly managing risk. The following initiatives have been implemented to continually improve the Corporation's asset management strategies.

Further optimization of maintenance programs based on equipment condition, performance and reliability assessments has been completed. A more detailed understanding of the overall condition of major system equipment groups has allowed Manitoba Hydro to strategically increase maintenance intervals on some equipment in relatively good condition. Manitoba Hydro will continue to monitor the overall condition of its major system equipment to ensure that the correct balance between maintenance and equipment replacement costs and reliability is achieved.

Enhanced condition assessments and economic analysis have been implemented to better determine the economic end of life of equipment or equipment groups. This strategy is expected to reduce life cycle costs as well as reduce overall system maintenance costs by undertaking equipment replacements at the optimum time considering cost and risk. A number of programs have been established for some asset types to fund replacements where condition assessments and economic analysis justify proactive replacements.

Various software systems that support asset management processes have been enhanced or replaced with more effective solutions. For example, the Corporation is presently implementing an integrated Enterprise Asset Management system that supports asset management processes at the corporate level, starting initially with the generation, HVDC, protection and communication assets. These types of systems will assist in minimizing equipment failures and also avoid decreases in system availability by ensuring all work is completed in an optimal fashion, and information is recorded to support asset management analysis processes. The Corporation has also implemented reporting enhancements for operating performance and equipment condition analysis, which further strengthens the capital planning process.

5.14.8 Technology Modernization Initiative for Better Capital Investment Decisions

Manitoba Hydro has been working with an external party to evaluate how it can advance its business activities through the use of smarter grid technologies. It is believed that investing today in smarter distribution equipment and information technology will provide economic benefit through enhanced capital improvements to Manitoba Hydro's distribution network over the decades to come.

The expected outcome of this detailed investigative partnership is that the Corporation will be in a far better position to maintain or improve system reliability, manage localized capacity constraints, operate more safely and efficiently, enhance customer service and better manage utility infrastructure with evolving customer load expectations. Other benefits that can be expected include a reduction in field operating costs when responding to outages and enhanced customer knowledge toward greater demand-side management efficiencies.

This investment in technology would allow the Corporation to gain a greater understanding of where capacity constraints and reliability issues specifically reside and prioritize its capital investments in areas that are both critically important and urgent.

5.14.9 Supply Change Management Initiatives

The Corporation is undertaking a number of supply change management initiatives intended to realize savings on goods and services purchased, reduce or avoid operating costs, reduce working capital, reduce capital expenditures on vehicle acquisitions, and reduce costs associated with fuel expenditures and external repairs and maintenance. A number of these initiatives started in 2014/15, while some are scheduled to begin in 2015/16 and 2016/17.

The supply chain management initiatives include implementing stronger category management (procurement) practices; improving inventory management processes; optimizing material distribution networks; improving governance for critical spares inventory; improving forecasting and planning for inventory management; optimizing Manitoba Hydro's vehicle fleet; and, improving the repair, maintenance and fuel supply network for fleet vehicles.

5.14.10 Records Centre Transition to Iron Mountain

Manitoba Hydro is contracting out to a third party service provider the processing and storing of the Corporation's physical records, which is currently managed by the Internal Records Centre. This initiative will deliver cost savings and improve service levels. A third party provider is able to provide a more secure environment for the Corporation's physical records.

As a result of the transition of the Records Centre to a third party provider, there will be a reduction of two EFTs, who are being redeployed to other areas of the Corporation to fill existing vacancies. In addition, this initiative will result in the availability of over 4,600 ft^2 of space to relocate work groups currently located outside of 820 Taylor Avenue. Moreover, service levels will improve with accessibility to physical records 24/7 rather than during Manitoba Hydro regular business hours.

5.14.11 Outage Management System

The implementation of Manitoba Hydro's outage management system is considered one of many steps toward modernizing the Corporation's distribution grid. Manitoba Hydro is continually undertaking efforts and implementing changes in its operations in order to leverage technology and continue to provide reliable customer service with improved labour productivity.

One of these initiatives includes the replacement of Manitoba Hydro's trouble call response system with an Outage Management System. The new system will improve Manitoba Hydro's ability to respond to and restore unplanned outages.

These cost containment measures have assisted the Corporation in maintaining projected annual rate increases at 3.95%, despite the Corporation facing significant and increasing cost pressures. This is consistent with the expectations of the PUB in Order 43/13, wherein it recommended that Manitoba Hydro control OM&A costs increases below inflation.

Re-powering our province

Manitoba Hydro-Electric Board
63rd Annual Report - For the Year Ended March 31, 2014

Manitoba Hydro

TABLE OF CONTENTS

July 31, 2014

Honourable Stan Struthers
Minister charged with the administration of the Manitoba Hydro Act
Legislative Building
Winnipeg, Manitoba
R3C 0V8

Dear Minister:

I have the honour of presenting the 63rd Annual Report of the Manitoba Hydro-Electric Board, together with the financial statements, for the fiscal year ended March 31, 2014.

Respectfully submitted,

William C. Fraser, FCA
Chair, Manitoba Hydro-Electric Board

Corporate profile

Manitoba Hydro is a provincial Crown Corporation and one of the largest integrated electricity and natural gas distribution utilities in Canada. We provide reliable, affordable energy to customers throughout Manitoba and trade electricity within three wholesale markets in the Midwestern United States and Canada. Nearly all of the electricity Manitoba Hydro produces each year is clean, renewable hydro power generated using the province's abundant water resources. We are also a leader in promoting conservation, providing a suite of Power Smart* programs to help our customers get the most out of their energy dollar.

Vision

To be recognized as a leading utility in North America with respect to safety, reliability, rates, customer satisfaction and environmental leadership.

Mission

To provide for the continuance of a supply of energy to meet the needs of the province and to promote economy and efficiency in the development, generation, transmission, distribution, supply and end-use of energy.

5 725 megawatts
Total electricity capability

536 081

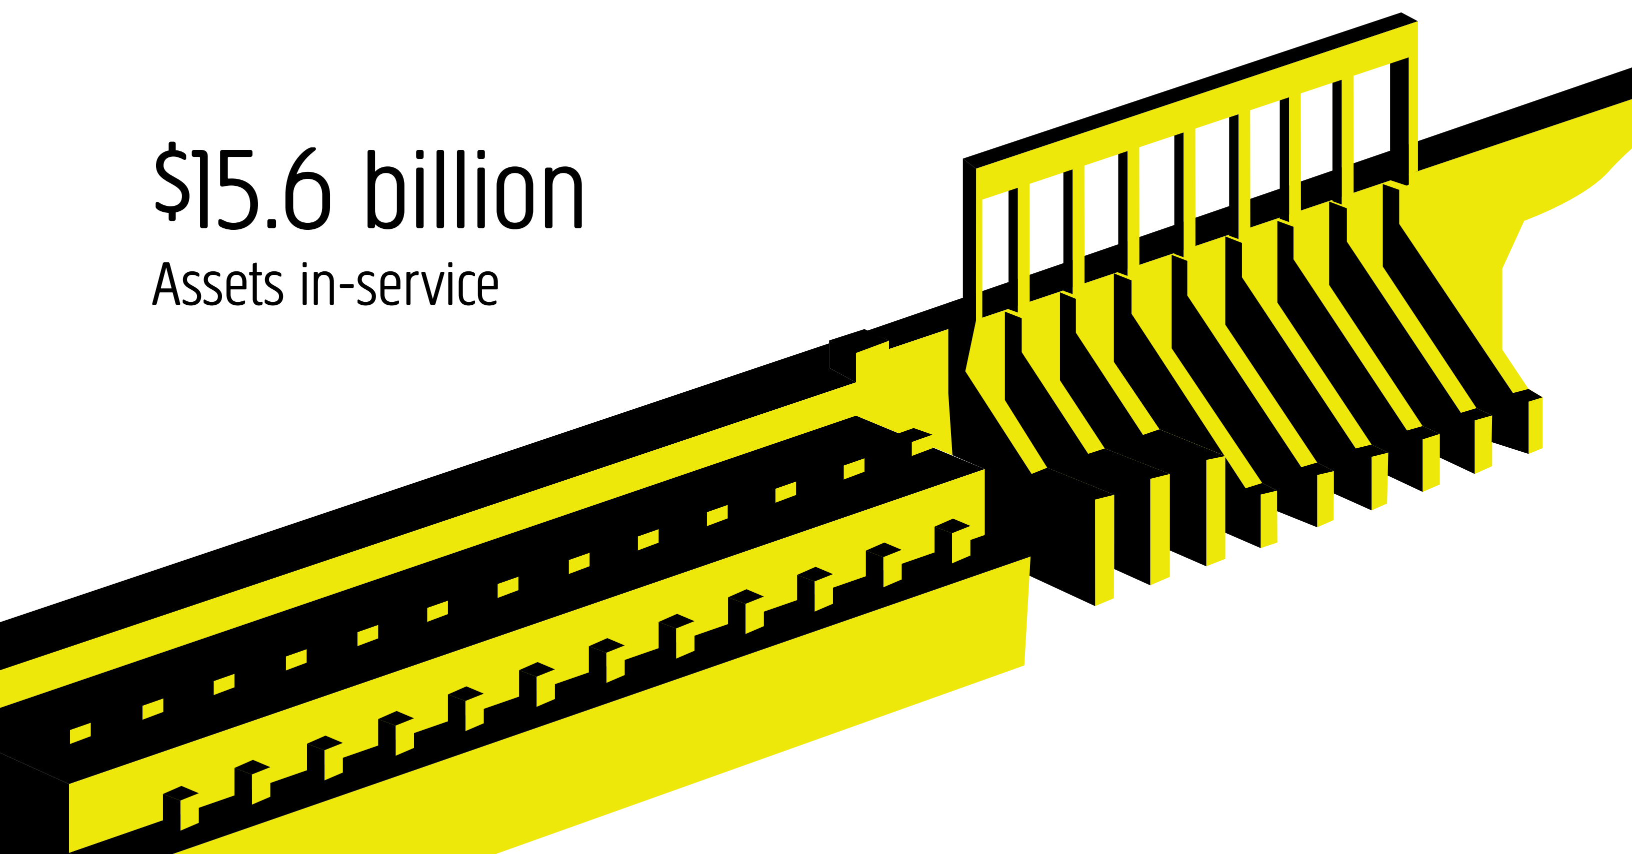
Revenue from Manitoba sales of electricity and natural gas

$15.6 billion

Assets in-service



Chair's message

Manitoba Hydro is working to preserve a legacy of affordable energy and derive value from the province's abundant renewable energy resources for all Manitobans.

This past year saw the successful completion of negotiations with Wisconsin Public Service resulting in two new power sales; one for 108 megawatts from 2016 to 2021 and another for 308 megawatts for up to 10 years starting in 2027. These agreements bring the total value of Manitoba Hydro's recently signed export contracts to over $9 billion. Electricity rates in Manitoba would be considerably higher without export sales, so continuing to pursue further opportunities must be a priority. To that end, Manitoba Hydro signed memorandums of understanding to investigate future sales of up to 600 megawatts with Great River Energy of Minnesota and 500 megawatts with SaskPower.

The corporation also continued moving forward with plans to develop new sources of clean, renewable hydroelectricity in the north. The

Electricity rates in Manitoba would be considerably higher without export sales, so continuing to pursue further opportunities must be a priority.

Keeyask Generating Station will be built, pending necessary approvals, in partnership with four First Nations – Tataskweyak Cree Nation, War Lake First Nation, Fox Lake Cree Nation and York Factory First Nation. Through this approach, first undertaken with the Wuskwatim Generating Station, First Nations people who live in the

directly affected area are involved in the planning of the project, take part in the development and have access to its benefits. A recent independent assessment of Keeyask under the Hydropower Sustainability Assessment Protocol concluded the project was a prime example of sustainability, in part, because of the extensive participation by the First Nation partners.

The five First Nations in the vicinity of the proposed Conawapa Generating Station also have an opportunity to participate in that project. Fox Lake Cree Nation, York Factory First Nation, Tataskweyak Cree Nation, Shamattawa First Nation, War Lake First Nation and Manitoba Hydro are already collaborating on planning and environmental studies. In addition, agreements related to potential training, employment, business and income opportunities are being negotiated.

The board was also pleased to see the start of construction on the Bipole III transmission project that will benefit all of Manitoba by strengthening the reliability of the province's electricity supply and providing additional capacity needed to deliver electricity from new northern generating stations to southern Manitoba. The Manitoba Environment Act license for Bipole III was issued in August.

I and my fellow board members are tasked with ensuring Manitoba Hydro carries out its legislated mandate to meet the energy needs of the province in an economic and efficient manner. To accomplish this, board members participate in audit, human resources and governance, and planning committees. We advise management as it decides on strategic objectives and approve major capital projects.

I would like to express my appreciation to all board members for their attentive efforts over the past year.

Manitoba Hydro's performance, both financially and operationally, is worthy of praise. It attests to diligent management and effective employees. I thank all employees for their contributions to Manitoba Hydro's success.

William C. Fraser, FCA
Chair
Manitoba Hydro-Electric Board

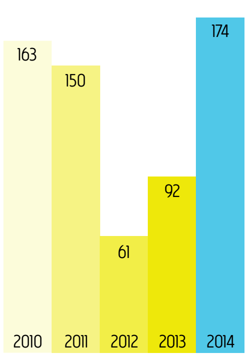
President & CEO's message

The past fiscal year saw many achievements by Manitoba Hydro. The corporation booked a higher than forecast consolidated net income of $174 million that increased retained earnings to $2.72 billion, the highest level of equity in our history. This $82 million improvement over the previous year's net income was the result of higher volumes in export electricity sales, higher export prices and increased consumption arising from a much colder winter.

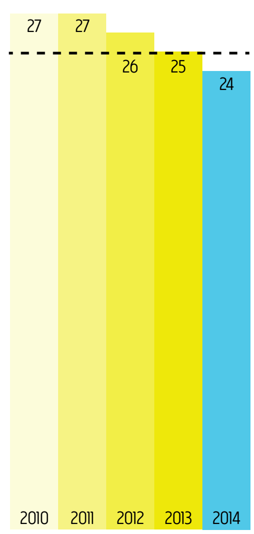
The coldest winter in 116 years pushed parts of our system to the edge with many of our electric transmission and distribution stations operating at or near the limits of their capacity. Yet there was little impact on our service, thanks to the effective planning and balancing of loads by our staff.

Manitoba Hydro also took major steps forward in our plan for meeting the growing energy needs of this province. We prepared and submitted the business case for our preferred development plan to the Manitoba Public Utilities Board, who subsequently conducted a public Needs For and Alternatives To review. We also participated with our four First Nation partners in the Clean Environment Commission's review of the environmental impact statement for the planned Keeyask Generating Station.

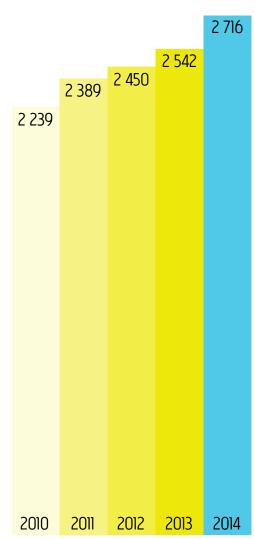
However, what stands out for me personally are the extraordinary efforts of our employees — the men and women who worked long hours, giving up weekends and family time, to prepare for and participate in various regulatory hearings; those who worked tirelessly in January to support our customers in south central Manitoba during a four-day loss of supply from TransCanada Corporation's main pipeline; or the 42 individuals who selflessly gave up their Christmas holiday to



Net Income (millions of dollars)



Equity Ratio - For the year ended March 31
Target - - -



Retained Earnings - For the year ended March 31
millions of dollars

help the people of Toronto regain power after a devastating ice storm.

These examples demonstrate the character of our employees and the commitment to service that permeates this organization. This proves to me that we have the team to successfully re-power our province.

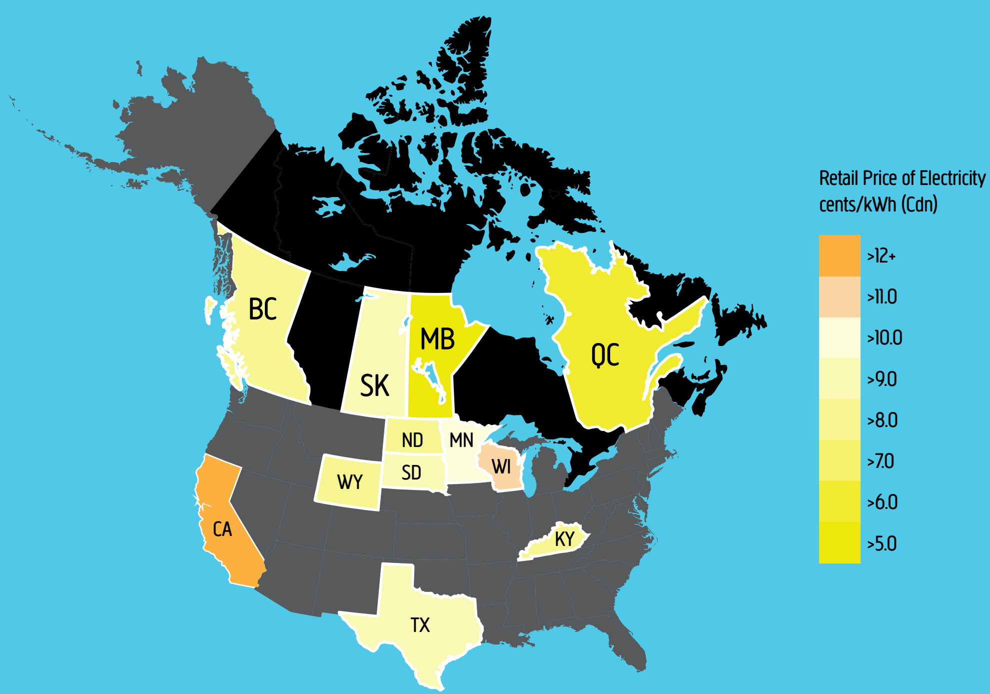
Demand is growing by about 80 megawatts a year and Manitoba needs new sources of electricity by about 2023. We have evaluated different scenarios involving population growth, economic growth and demand side management but these variables only affect the timing for new generation by a few years. Given the long lead times required to develop new generating stations, we are at a point where a decision must be made on how Manitoba Hydro will fulfill its obligation to meet the province's future electricity needs.

Our preferred development plan includes two projects that will proceed immediately, pending necessary regulatory approvals: the 695-megawatt Keeyask Generating Station to be in-service in 2019 and a new 500 000-volt transmission interconnection to Minnesota with an in-service date of 2020. It also includes the 1 485-megawatt Conawapa Generating Station with a projected in-service of 2026; however, a decision to proceed with this project is not required until 2018 and Conawapa will only be built if the business case remains sound.

At the same time, many of Manitoba Hydro's generation, transmission and distribution assets are approaching the end of their service life and becoming more costly to maintain. The risk of equipment failure is growing and outages may become more frequent and last longer if adequate investment is not made to upgrade and renew these facilities. In Winnipeg, for example, 20 distribution substations need

Retail Price of Electricity - cents/kWh (Cdn)

6.4	Manitoba
6.4	Quebec
8.0	British Columbia
8.5	Wyoming
8.6	Kentucky
8.9	North Dakota
9.1	Saskatchewan
9.5	South Dakota
9.7	Texas
10.3	Minnesota
11.3	Wisconsin
15.0	California



Deregulated jurisdictions such as Alberta and Ontario are not included in this comparison as there are numerous utilities providing service in each province, making it difficult to derive an overall bundled average retail rate that includes generation, transmission and distribution service.

President & CEO's message

to be replaced or refurbished by 2020. Other assets in need of renewal across the province include wooden distribution poles, underground electric cables and manholes.

The reality is electricity rates in Manitoba must rise to ensure the ongoing safety and reliability of our electricity supply and delivery system. It's a story repeating itself across North America as other utilities address aging infrastructure and growing demand. The British Columbia government announced that electricity rates will increase by nine percent in 2014 and six percent in 2015. SaskPower proposed rate increases of 5.5 percent in 2014 and five percent in each of 2015 and 2016. The Ontario government's 2013 Long Term Energy Plan indicates residential customers in that province could see their bills increase by 9.6 percent in 2014, 5.8 percent in 2015 and 15 percent in 2016.

The challenge facing Manitoba Hydro is balancing the needed investment in our system with maintaining the financial health of the corporation and providing stable, predictable rates for our customers.

Manitoba's electricity rates continue to be among the lowest overall in North America. That is due, in large part, to the corporation's past investments in developing hydroelectric generating stations and to the revenue that's been earned by selling surplus electricity from those stations into the export market. Those revenues totaled $439 million in 2013-14, 23 percent of our total electricity revenue for the fiscal year.

Manitoba Hydro's plan for re-powering our province builds on this legacy and will allow us to make needed investments and maintain financial strength through reasonable, gradual electricity rate increases that will provide adequate revenues and avoid the need for higher rate increases in the future.

The generation resources in our preferred development plan are supported by a number of export agreements, including a 250-megawatt sale to Minnesota Power plus a 108-megawatt sale and a 308-megawatt sale to Wisconsin Public Service. These long-term agreements, along with forecast domestic demand growth, have essentially sold out the surplus associated with the Keeyask Generating Station. They also reflect prices substantially more attractive than those in our existing firm export contracts and will help reduce the costs of building new generation supply for Manitoba ratepayers.

In addition, our plan includes a substantially increased investment in demand side management. New and expanded Power Smart programs will aggressively target additional electricity and natural gas savings, helping our customers reduce their energy costs. Manitoba Hydro customers have saved over $860 million since the Power Smart program was launched in 1991.

The challenge facing Manitoba Hydro is balancing the needed investment in our system with maintaining the financial health of the corporation and providing stable, predictable rates for our customers.

Balancing the financial health of Manitoba Hydro with reasonable rates will also require a concerted effort to control costs within the corporation. One measure already implemented is the evaluation of positions vacated by retirements to determine whether they need to be filled or if we can change the way we work. It's an opportunity created by the demographics of our workforce — over 900 employees are eligible to retire in 2014. However, we need to ensure staffing levels are adequate to provide safe and reliable service. We also need to manage the loss of valuable experience and knowledge that can result from the retirement of key contributors.

This last point was brought home this past year with the retirement of two members of our executive team. Ken Adams and Ed Tymofichuk both brought vast experience to their roles and contributed greatly to Manitoba Hydro's success over their long careers. Ken, who retired as Vice-President of Major Capital Projects, was instrumental in setting the course for recent and planned supply-side additions, including the precedent setting partnership with Nisichawayasihk Cree Nation to build the Wuskwatim Generating Station. Ed, who retired as Vice-President of Transmission, helped to lead the corporation through a number of key projects including a new system control centre and regulatory approval for the Bipole III transmission project. I would like to thank both of them for their outstanding service and support over the years.

I also want to thank the members of the Manitoba Hydro-Electric Board and particularly the Chair, Bill Fraser, for the support and counsel provided over the past year.

Finally, I want to express my gratitude for the contribution of our employees. Their dedication and commitment demonstrated over the past year is what will allow us to meet the challenge of continuing to provide the value and reliability our customers have come to expect from their energy utility.

Scott A. Thomson, CA
President and Chief Executive Officer
Manitoba Hydro

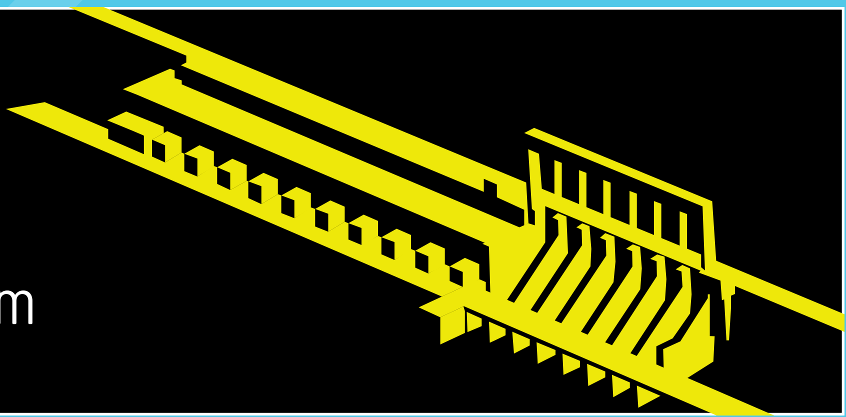
Harnessing resources

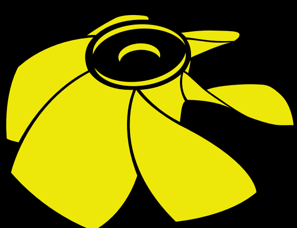
Manitoba Hydro operates 15 hydroelectric generating stations that harness the energy of the province's rivers to meet the electricity needs of our customers. We also maintain two small thermal generating stations and purchase power from two independent wind farms to support this hydroelectric system.

$714 million

Invested to build and maintain generation system



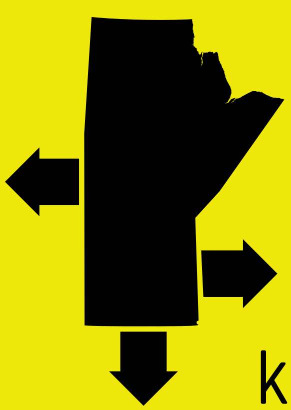
Total hydraulic generation: 35.3 billion kilowatt hours



Total Manitoba sales:

22.4 billion kilowatt hours

Total export sales:



10.5 billion kilowatt hours

Harnessing resources

Reviewing preferred development plan

Public hearings on Manitoba Hydro's plan for meeting the future electricity needs of the province began in March 2014. The hearings are part of a Needs For and Alternatives To review by the Manitoba Public Utilities Board (PUB) aided by a number of independent expert consultants from across North America.

The corporation's preferred development plan includes the 695-megawatt Keeyask Generating Station, a new 500 000-volt transmission interconnection with Minnesota, additional export sales and aggressive demand side management. The plan also protects the option to build the 1 485-megawatt Conawapa Generating Station subsequent to Keeyask. The 5 000-page business case for the preferred plan submitted to the PUB in August 2013 describes the extensive process used to arrive at a short list of viable options and presents an in-depth analysis of 15 alternative development plans over 27 scenarios involving 400 cases. It concludes that the preferred development plan meets Manitoba's electricity needs at the lowest cost to ratepayers over the long-term and provides the greatest benefits to the province.

Subsequent to the August filing, a substantial amount of information and analysis was provided to the PUB on three additional levels of demand side management, including a further 19 alternate development plans. Nearly 50 days of hearings were scheduled involving five registered interveners, 31 consultants and more than 20 presentations by the public. The hearings are expected to end in May with a report submitted to the minister responsible for the Public Utilities Board Act by no later than June 20.

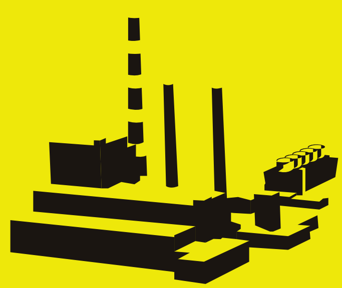
Concluding Keeyask environmental review

The Manitoba Clean Environment Commission conducted a public hearing on the planned Keeyask Generating Station as part of an environmental licensing review. Thirty-eight days of public hearings on the project's environmental impact statement concluded in January and the commission was expected to submit a recommendation report within 90 days to the Minister of Manitoba Conservation and Water Stewardship.

The $6.5-billion Keeyask Generating Station is being developed, pending regulatory approvals, by the Keeyask Hydro Power Limited Partnership consisting of the four Keeyask Cree Nations — Tataskweyak Cree Nation, War Lake First Nation, Fox Lake Cree Nation, York Factory First Nation — and Manitoba Hydro. The site for the station is on the Nelson River approximately 30 kilometres west of Gillam within the Split Lake Resource Management Area. Once completed, the Keeyask Generating Station will provide an average of 4.4 billion kilowatt hours of renewable energy each year.

Sources:

hydroelectric 95.4%



thermal 0.4%

In March, the general civil contract for Keeyask was awarded to a limited partnership between Bechtel Canada, Barnard Construction of Canada and EllisDon Civil. Pending regulatory approvals, construction is scheduled to start in the summer of 2014 with an in-service of 2019.

The majority of the infrastructure required to support construction of Keeyask, including an all-weather access road and the first phase of the main construction camp, was near completion at the end of the fiscal year. An early start to construction of this infrastructure was undertaken to minimize risk of delays and to optimize employment, training and business opportunities for the Keeyask Cree Nations. Multiple training opportunities at site included specialized, on-the-job training programs for road construction, work-site area development, catering/housekeeping, security, emergency medical services and camp maintenance. A range of apprentices also acquired work experience on main camp construction.

Planning for Conawapa

Preparatory engineering, environmental and consultation work for Conawapa, the other generating station in Manitoba Hydro's preferred development plan, continued throughout the fiscal year to protect a construction start date of 2018 and an earliest in-service date of 2026. Environmental and Aboriginal Traditional Knowledge studies are underway with the intent of having the environmental impact statement finalized and available to file with regulators by the end of 2015.

The Conawapa Generating Station would be built on the Nelson River, about 90 kilometres downstream of Gillam, in the Fox Lake Resource Management Area. When complete, Conawapa will produce an average of seven billion kilowatt hours of electricity annually, making it the largest generating station in Manitoba.

A formal planning process is underway with the communities in the vicinity of the proposed generating station, including Fox Lake Cree Nation, York Factory First Nation, Tataskweyak Cree Nation, War Lake First Nation and Shamattawa First Nation. An agreement related to ownership of the station, income and business opportunities was reached with Fox Lake Cree Nation in June 2013. Discussions have been ongoing with Fox Lake regarding project opportunities. A memorandum of understanding between Fox Lake Cree Nation, the Province of Manitoba and Manitoba Hydro recognizes that Fox Lake will have a leading and significant role in the planning process of the Conawapa Generating Station because of its proximity to the community.

Realizing export opportunities

Manitoba Hydro's strategy of growing export revenues to keep our customer's electricity rates lower than they would be otherwise and defray some of the costs for new generating

Purchases excluding wind 1.7%

Harnessing resources

stations resulted in a number of power sale agreements in 2013-14.

A 200-megawatt seasonal diversity exchange with Great River Energy of Minnesota was signed in July, extending a 150-megawatt arrangement that has been in place since 1995. The new agreement runs until 2030.

In September, Manitoba Hydro and SaskPower executed a 25-megawatt term sheet to supply firm power to Saskatchewan's far north from 2015 to 2022. The two utilities also signed a memorandum of understanding to investigate a potential 500-megawatt sale that would begin after 2020.

In December, Manitoba Hydro and Minnesota Power signed a 50-megawatt firm power sale from 2015 to 2020, replacing an existing 50-megawatt arrangement that expires in 2015.

In February, two major power sales to Wisconsin Public Service were announced. The first sale running from 2016 to 2021 is for 108 megawatts of firm power. The second sale, which would use electricity produced by the proposed Conawapa Generating Station, is for 308 megawatts of firm power for up to 10 years starting in 2027. The 308-megawatt sale also requires a new 500 000-volt transmission interconnection to Minnesota. A 100-megawatt sale to Wisconsin Public Service announced in 2011 is scheduled to run from 2021 to 2026, bridging the gap between the two new deals.

Also in February, a memorandum of understanding was signed to jointly investigate the sale of up to 600 megawatts of electricity from Manitoba Hydro to Great River Energy commencing in approximately 2020.

Upgrading spillway at Pointe du Bois

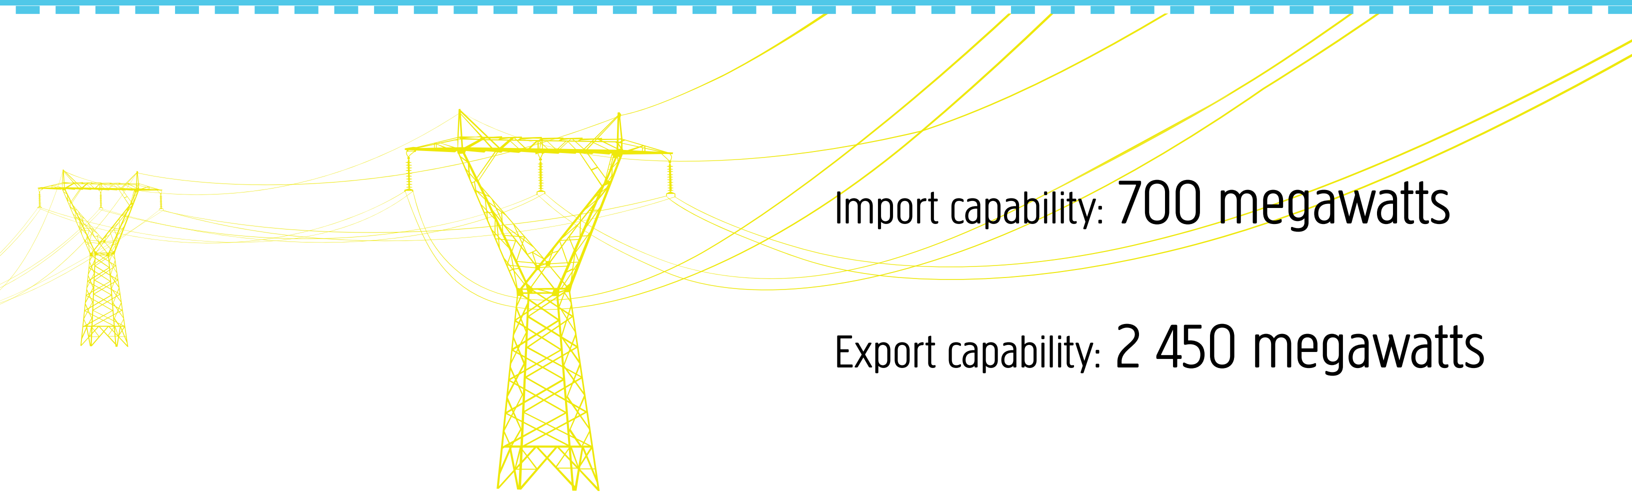
Nearly all of the existing spillway bays or sluiceways at the Pointe du Bois Generating Station have to be manually operated, a difficult task in icy conditions. The $560-million Spillway Replacement Project will replace these century-old structures with a seven-bay spillway and earth-fill dam, providing a safer work environment for Manitoba Hydro employees. The new spillway structure will also increase the station's flood capability to meet the Canadian Dam Association's dam safety guidelines.

Installation of gates as well as the mechanical and electrical systems for the new spillway structure was ongoing at the end of the fiscal year.

Rehabilitating existing generators

Generators at a number of Manitoba Hydro's older stations were rehabilitated during the fiscal year.

A seven-year project to recondition all of the Kelsey Generating Station's units was completed in July when the last unit was returned to service. The Kelsey Re-runnering



Import capability: 700 megawatts

Export capability: 2 450 megawatts

Project increased the station's total output by approximately 77 megawatts at a cost of $300 million. The work included rewinding of the stators and rotors, modifications to the draft tubes and installation of new turbine runners.

At the Pointe du Bois Generating Station, a unit was returned to service after rehabilitation of the runner-shaft coupling assembly, repairs to the runner and refurbishment and replacement of other turbine components. Work is continuing on three other units which are expected to be returned to service by the summer of 2015.

At the Great Falls Generating Station, a unit was returned to service following replacement of a failed generator stator. The project included installing a new stator, refurbishment of the rotor and various other improvements.

Work is also underway at the Pine Falls Generating Station to rewind a failed stator and refurbish the rotor field poles on a unit. The work is expected to be completed in July 2014.

Representatives of Manitoba Hydro and the Keeyask Cree Nation Partners at public hearings to review the corporation's preferred development plan.

Enhancing reliability

Manitoba Hydro maintains a vast network of electric transmission and distribution lines, as well as natural gas distribution pipelines, to deliver energy across the province. This network includes 12 electric transmission interconnections with neighbouring utilities.

76 000 km

Commissioning the new Riel Terminal Station east of Winnipeg.

Enhancing reliability

Building reliability with Bipole III

Construction began this past winter on Bipole III, a new high voltage direct current transmission line required to enhance Manitoba Hydro's system reliability. The Manitoba Environment Act license for Bipole III was issued in August after a rigorous public hearing on the project's environmental impact statement and a subsequent report by the Clean Environment Commission.

The Bipole III project includes: a 1 384-kilometre, 500 000-volt direct current transmission line; the Keewatinoow Converter Station near the site of the proposed Conawapa Generating Station, and the Riel Converter Station on the east side of Winnipeg. These facilities will back-up the Bipole I and II high voltage direct current transmission systems, which share a common right-of-way corridor, and the Dorsey Converter Station. Dorsey is the only outlet in southern Manitoba for hydroelectricity generated on the lower Nelson River — the source of over 70 percent of the electricity produced in the province. Bipole III will also provide additional capacity for delivery of electricity from the proposed Keeyask and Conawapa generating stations to southern Manitoba.

In January, work began on clearing the right-of-way in northern sections between Thompson and The Pas. Work also got underway on a line to provide construction power to the site of the Keewatinoow Converter Station. This work was being done under a direct negotiated contract with a joint venture partnership between Fox Lake Cree Nation and Valard Construction.

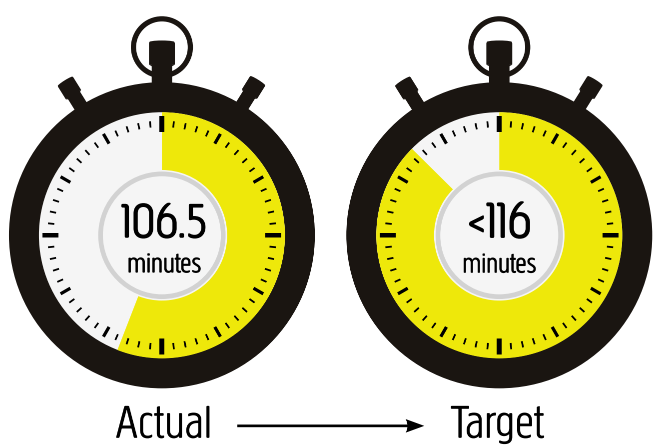
Engaging on transmission routes

In November, Manitoba Hydro began seeking public input to be used in route selection and environmental assessment for the proposed Manitoba-Minnesota Transmission Project. The project, which is part of the corporation's preferred development plan, includes a 500 000-volt alternating current transmission line originating at the Dorsey Converter Station near Winnipeg then heading south to the Manitoba-Minnesota border where it will connect to the Great Northern Transmission Line to be built by Minnesota Power. Along with providing additional opportunities for export sales to the U.S., the new line will provide increased reliability for Manitoba's energy supply, allowing for the import of additional electricity during emergency outages or droughts. Manitoba Hydro expected to file an environmental impact statement for the project in 2015. Subject to regulatory approvals, the project's planned in-service date is mid-2020.

Public input was also sought on two proposed 230 000-volt transmission lines, both originating at the St. Vital Transmission Station in southwest Winnipeg. These new transmission lines will improve system reliability and accommodate growth in electricity demand in south central Manitoba. The St. Vital to Letellier line is expected to be in-service in 2017. The St. Vital to La Verendyre line is expected to be in-service

System average interruption duration

(minutes per year).



in 2018. A preferred route was presented to the public in November. Feedback is being compiled to finalize the route and complete the environmental assessment. A report on the project is expected to be submitted to Manitoba Conservation and Water Stewardship in mid-2014.

Completing new terminal for key interconnection

The Riel Terminal Station was nearing completion at the end of the fiscal year with commissioning of the control system underway. The new alternating current terminal will create a second point where electricity imported from the United States on an existing 500 000-volt transmission line can be introduced into Manitoba Hydro's transmission network. Undertaken to reduce dependence on the existing terminal station at Dorsey, the Riel Terminal Station will improve the reliability of the province's energy supply, protecting against prolonged outages to existing termination facilities or droughts.

Located just east of Winnipeg, the Riel Terminal Station is expected to be in-service in 2014 at a cost of $330 million. Bipole III will also terminate at the Riel site and include the addition of converters and ancillary equipment.

Expanding capacity with new stations

Work progressed on the replacement of aging, capacity-constrained transmission and distribution stations during the fiscal year. Foundation and building construction was underway at the end of March for the new Rockwood East Transmission Station north of Winnipeg. The station will increase capacity and eventually replace the 1940s-era Parkdale Station. Erection of steel structures and installation of electrical equipment was also underway at a new transmission station near Neepawa. Needed to meet forecast load growth in the area, the station is scheduled to be in-service in 2015.

Of the 97 distribution substations in Winnipeg, Manitoba Hydro expects to replace or refurbish 20 by 2020. The new Martin Avenue substation in Winnipeg was under construction adjacent to a substation which was built in the 1950s and is no longer adequate to meet the area's electricity needs. Groundwork began in March 2013 and the new substation is scheduled to enter service in late 2014. The new Burrows substation in Winnipeg's north end was placed in-service during the year. Work continued to convert the distribution lines emanating from the new station to a higher capacity 12 470-volt design from the existing 4 160-volt. When the conversion project is complete, the Burrows substation will replace three substations which were over 60 years old and had reached the limit of their capacity.

Preliminary design work was underway on a new substation to replace the St. James substation located on the corner of Portage Avenue and St. James Street in Winnipeg. The Madison substation will address reliability concerns arising from the aging infrastructure at the existing substation and provide more capacity to serve the growing number of commercial and industrial customers in the area. Construction of the Madison substation is expected to begin in the summer of 2014 with an expected in-service of 2016. Design work also began for an expansion of the York Street substation that will see the addition of three transformer banks and sets of 12 470-volt switchgear. The project, which will accommodate projected load growth in downtown Winnipeg, is expected to be in-service by summer of 2016. Planning began for the new Adelaide substation which will replace the King Street substation in Winnipeg's market district. The King Street substation building is over 100 years old and no longer adequate to meet reliability and safety requirements. The expected in-service for the Adelaide substation is spring 2017.

In rural Manitoba, a number of distribution supply centres were under construction to support increased electricity demand. Distribution supply centres are complete

Enhancing reliability

substations, with all the components pad-mounted and conductors buried underground, which can effectively serve areas with lower load densities. The result is a sleek, compact design with less visual presence than a traditional, wood-pole and steel substation. New distribution supply centres are being built east of Kleefeld, at Selkirk, near Lockport and in McTavish near Morris.

Beginning manhole rebuilds

A concerted effort began under the streets of downtown Winnipeg in the last year to rebuild manholes which are an important part of Manitoba Hydro's electrical distribution system. The corporation has approximately 2 400 manholes throughout the province with over 1 800 in downtown Winnipeg. Some of these enclosures are over 100 years old. An engineering survey identified approximately 350 manholes in need of rehabilitation or replacement within the next 20 years at an estimated cost of $52 million. Priority is being given to manholes located on public roadways because they are subjected to the most severe conditions and present the highest risks to the public.

Injecting new life into aging cables

A pilot project explored the logistics and costs associated with using injected silicone to extend the life of aging underground electricity distribution cables. Manitoba Hydro has over 6 000 kilometres of underground electric cable, approximately 3 300 kilometres of which is a cross link polyethylene insulated variety installed between 1970 and 1986 that has started to reach the end of its useful life.

The injection method forces silicone under pressure into the cable's strands of conductors flushing out impurities and encapsulating any moisture within the insulation sheathing. The process can extend the life of the cable by up to 40 years. It is also significantly less expensive and quicker than replacing the cable outright which involves significant labour and disruption to property owners. The pilot study concluded that the average cost of silicon injection was about five times less per metre than the cost of traditional cable replacement. Based on these results, the corporation began a more comprehensive silicone cable injection program to address its aging cable infrastructure.

Upgrading natural gas pipeline

A new pipeline was installed in south central Manitoba providing additional capacity needed to meet increased natural gas usage and community growth. The 14.5-kilometre, 114.3-millimetre diameter steel pipeline runs from a point approximately four kilometres west of Letellier to St. Jean Baptiste. Construction began in August and was completed in October.

Average electric customer outage (frequency per year) 1.3

To provide additional capacity needed to maintain natural gas service for the growing community of Headingly and support future growth in the area, a new natural gas pipeline was installed in the Rural Municipality of St. Francois Xavier. The project included 19 kilometres of new 168.3-millimetre steel pipeline connecting a natural gas station on Selkirk Avenue in Winnipeg to a new pressure regulation station in the municipality and an additional four kilometres of 219.1-millimetre polyethylene pipe connecting to an existing distribution pipeline west of Headingly. The pipeline installation and construction of the new station began in June and was completed in November.

Much of the planning and design work for upgrades to the Winnipeg natural gas transmission network was completed. Serving over 213 000 natural gas customers in Winnipeg and areas to the north, the network consists of four pipelines. The Winnipeg Northwest Upgrade Project will provide additional redundancy in supply and balance loads on the primary stations feeding Winnipeg. Phase one of the project, which includes installation of a new pressure regulating station near St. Andrews to support local growth in demand, will be completed in 2014-15.

Mitigating ice formation

Rising moisture content in natural gas supplied to Manitoba Hydro is increasing the risk of operational problems and outages. In response, the corporation initiated an analysis of available line heater technologies that can prevent freeze-off and ice formation. The analysis will evaluate supply and installation costs as well as predicted annual energy and maintenance costs. Plans were to complete designs for line heaters at two sites based on selected technologies and begin installation in 2015.

Serving customers

Extending Power Smart's reach

For over two decades Manitoba Hydro has been finding ways to help customers reduce energy use and lower their bills. That innovation continued in 2013-14 with the introduction of two new Power Smart initiatives.

The Power Smart for Business Pay As You Save (PAYS) Financing Program for commercial customers was launched in September. Working in conjunction with the full suite of Power Smart for Business incentive programs, PAYS provides attractive financing to help mitigate the capital cost barrier often associated with upgrading to an energy efficient technology. Financing is available with 10- to 25-year amortizations, depending on the energy efficiency upgrade, as long as the monthly repayment for the upgrade is less than the estimated annual utility savings calculated on an average monthly basis. Some of the energy efficiency upgrades eligible for financing with PAYS include insulation, LED lighting and geothermal heat pump systems.

In June, Manitoba Hydro introduced a new program that seeks to install geothermal heat pump systems on a mass scale throughout First Nation communities where homes typically use electric heat. The Power Smart Community Geothermal Program provides technical guidance, energy bill assessments and utilizes the residential PAYS Financing Program so community members can pay for the majority of the system through energy savings realized by the conversion to geothermal.

Through a partnership with Aki Energy, a non-profit social enterprise group, the Community Geothermal Program also created employment opportunities within First Nation communities. Community residents were trained in the installation and ongoing maintenance of the geothermal systems. This training was funded by the First Nations themselves. In 2013, 108 geothermal installations were completed in Fisher River Cree Nation and Peguis First Nation. At the end of the fiscal year, discussions were underway with four other First Nations on participation in the program.

Helping customers save

Manitoba Hydro offered 30 Power Smart programs including 16 for customers in the commercial sector and five for the industrial sector.

The Power Smart Bio-energy Optimization Program, for example, helped industries to use new technologies that convert waste streams into energy sources. These technologies can replace energy purchases from Manitoba Hydro and lower operating costs. Tundra Oil and Gas utilized the program to install three micro-turbines that use flare gas to generate electricity at the company's oil and gas battery site near Cromer, Manitoba. The battery site receives

Investment in Power Smart programs:

$34 million

crude oil from surrounding wells and then removes the water and petroleum gases. The water is injected back into the oil producing formation and the petroleum gas is typically flared at site. The micro-turbines are capable of using that gas to generate 180 kilowatts and supply 1.4 million kilowatt hours of energy per year. The Bio-energy Optimization Program supported the project's feasibility study as well as the implementation phase.

The Performance Optimization Program helped Boeing Canada to identify improvements to the compressed air system at their Winnipeg manufacturing facility. A new energy efficient compressed air production and treatment system was installed that included multiple screw compressors, larger storage reserves, cycling dryers and sequenced compressor controls. In addition to installation of new equipment, an aggressive compressed air leak management and repair program further reduced energy use. The resulting efficiency improvements increased reliability at the plant and cut the energy costs of operating the compressed air system by 80 per cent, enabling Boeing to achieve load reductions of 583 kilowatts and annual energy savings of approximately 4.1 million kilowatt hours.

The community of La Salle worked with Manitoba Hydro to design and build a new community centre in accordance with Power Smart Design Standards. The 1 600 square metre multipurpose recreation and fitness centre is at least 33 per cent more efficient than a typical centre with features such as: high levels of roof, wall and floor insulation; ventilation heat recovery; energy efficient lighting fixtures; and a high efficiency condensing hot water tank. The corporation provided technical advice as well as financial incentives through the Power Smart New Buildings Program.

Modernizing the service model

As part of an ongoing effort to modernize operations, Manitoba Hydro began consolidating rural district offices in southern Manitoba into regional customer service centres to improve customer service and reduce costs. At the end of the fiscal year, 19 of the corporation's district offices closed with an additional five offices slated to close by the end of the 2016-17 fiscal year. When complete, the consolidation is expected to reduce costs by approximately $2 million annually and avoid another $50 million in costs associated with needed facility upgrades to the 24 affected locations.

Since 2007, there has been a steady decline in customer transactions at district offices and a corresponding shift to using customer service centres or making bill payments online or by phone. The consolidation of staff will allow Manitoba Hydro to use resources more efficiently, while maintaining service levels to all customers. It will also further optimize the corporation's Mobile Workforce Management system which links computers in over 600 field trucks across the province. The system

Reduction in customer costs through Power Smart: $112.9 million

Serving customers

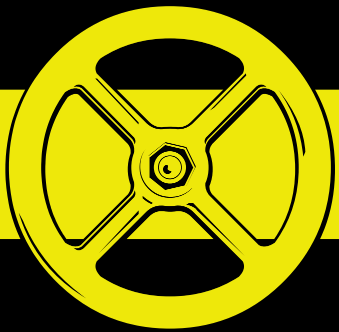
enables dispatch offices in Brandon, Selkirk and Winnipeg along with customer service centres to wirelessly assign field staff based on location, driving times, work priority and skills required. This centralized work planning combined with the relocation of staff and equipment in regional centres will strengthen electrical outage response and enhance system maintenance.

Responding to service disruptions

Electricity and natural gas service are critical parts of modern life; however disruptions in that service are an unfortunate reality of the energy utility business. As part of an effort to maintain the safety of all people as well as limit the damage to Manitoba Hydro and customer assets, the corporation has a comprehensive emergency response program to ensure an effective and coordinated response to possible emergencies and disasters. That program includes business continuity planning and continuous improvement.

On June 25, Manitoba Hydro staff responded to power outages affecting approximately 7 000 customers after heavy rains, lightning and high winds pounded the southwestern corner of the province. Over 12 centimetres of rain and winds exceeding 80 kilometres per hour resulted in 13 broken distribution poles, 30 leaning poles, 16 damaged transformers and 111 breaks in conductors. Employees from across the corporation responded and were able to restore power to virtually all customers within 12 hours. Less than three weeks later high winds and intense lightning again hit the southwestern corner causing outages to over 1 500 customers. Staff once again rose to the challenge working through the night to restore power to almost all customers by the next day. Repairs required included replacing 19 poles, installing six new transformers and 44 insulators, reinstalling 10 spans of three-phase conductor and repairing 131 conductor breaks.

In January, a breach in a TransCanada Corporation natural gas pipeline near Otterburne disrupted supply to Manitoba Hydro's system in south central Manitoba leaving about 3 600 customers without gas service. Facing a multiple day outage with temperatures dipping below -40 degrees Celsius, the corporation worked closely with the Provincial Emergency Measures Organization to identify critical community sites, such as hospitals, personal care homes and public warming centres, and then with TransCanada to source a temporary supply of compressed natural gas that was trucked in from Saskatchewan to service those sites. Once TransCanada repaired their pipeline, Manitoba Hydro staff went door-to-door, visiting all affected customers to ensure natural gas service was safely restored and to assist with relighting appliances. Service to all customers was restored within four days of the initial disruption. Throughout the outage, Manitoba Hydro worked closely with TransCanada to keep customers as well as municipal and provincial officials informed, providing regular media updates and important safety information.



Volume of natural gas delivered:

2 280 million cubic metres

Working with Boeing Canada staff, Manitoba Hydro helped make energy efficiency improvements to the compressed air system at Boeing's plant in Winnipeg.

Promoting safety

Maintaining a safe workplace and encouraging public safety around our facilities are critical components of all Manitoba Hydro activities.

Accident Frequency Rate:

11.1

High Risk Incidents:
Target: 0

0

Tailboard meetings are held prior to all site or field work to review job plans and ensure all safety hazards are identified, discussed and understood.

Promoting safety

Creating a culture of safety

Manitoba Hydro's workplace safety performance, as measured by two key indicators, was among the best in the last decade. In 2013-14, the corporation achieved an accident frequency rate of 0.69 incidents per 200 000 hours worked and an accident severity rate of 11.07 calendar days lost due to workplace injury or illness per 200 000 hours worked.

A number of initiatives were introduced during the fiscal year as part of an ongoing effort to instill a culture of safety among employees. In October, 16 Life Saving Rules were introduced to set a new basic standard for employee safety at Manitoba Hydro. Examples of these simple rules include: all workers must be qualified and authorized to perform work at Manitoba Hydro; obtain excavation authorization and use shoring as required; and, use personal protective equipment as required. The concepts inherent in the Life Saving Rules are to be incorporated into safe work procedures and all work activities within the areas of design, material specification, purchasing, contract administration, construction, operation and maintenance.

The corporation also adopted a new, non-subjective safety performance measure that will track the number of serious incidents opposed to high risk incidents beginning in 2014-15. These serious incidents will be communicated through safety incident alerts to managers, field safety officers, bargaining units and all employees in the business unit where the incident occurred or for whom the incident has direct relevance. The intent of these timely alerts is to reduce accidents by drawing attention to the incidents and reinforcing safe work practices.

A year-long internal safety awareness campaign kicked off in January featuring 12 employees who consistently display a personal commitment to safety in their work responsibilities and performance. These safety ambassadors and their personal reasons for staying safe at work and home are profiled throughout the year in the corporation's internal newsletter, on monthly posters displayed at various work locations and through quarterly videos. This is the third year for the safety campaign.

Manitoba Hydro's internal safety awareness campaign profiles employees who consistently display a personal commitment to safety.

Promoting public safety

Safety and educational resources from Manitoba Hydro including presentations, in-services, videos and educational kits continue to be in high-demand by schools throughout the province. For example, the corporation provides resources instructing students and drivers on what to do if a school bus makes contact with a downed power line. Brochures were distributed to 21 870 students who rode a bus to school as were another 1 100 copies of pamphlets specifically targeted at bus drivers. Video segments on school bus safety and safe exit from a vehicle were also viewed at 68 schools. In total, presentations promoting safety around natural gas and electricity were delivered to over 10 000 students in 2013-14.

An educational iPad app developed by Manitoba Hydro to help teach children about electrical safety had more than 3 000 downloads in the past fiscal year. Electric Gremlins takes the player on a race through a maze of wires to find and fix electrical hazards. Available free-of-charge on iTunes, the app is promoted through schools province-wide. Versions for iPhones and iPods as well as Android devices are in the final stages of development.

Protecting the environment

Manitoba Hydro strives to uphold the principles of sustainable development, incorporating environmental awareness and protection in everything we do.

Protecting the environment

Assessing Keeyask sustainability

The results from an independent assessment of the planned 695-megawatt Keeyask Generating Station under the Hydropower Sustainability Assessment Protocol were released in September. The report concluded 95 percent of the assessment aspects ranked above the good practice level. The project received the highest possible score on 16 of the 22 topics assessed, more than any other project assessed in the world to date.

The Hydropower Sustainability Assessment Protocol is a framework to assess hydropower projects according to a defined set of sustainability topics encompassing environmental, social, technical and financial issues using a consistent and globally applicable methodology. The protocol was developed by the Hydropower Sustainability Assessment Forum which included representatives from the hydropower sector as represented by the International Hydropower Association, social and environmental non-governmental organizations including the Nature Conservancy, World Wildlife Fund, Transparency International and Oxfam, governments in developed and developing countries, and financial organizations such as the World Bank and the Equator Banks.

Analyzing greenhouse gas emissions

A lifecycle analysis of the proposed Conawapa Generating Station by the Pembina Institute found the associated greenhouse gas emissions would be very small and lower than any of the generation alternatives. The results mirror those of previous analysis done for the Keeyask Generating Station and the Wuskwatim Generating Station. One component of the analysis is the implications associated with flooding. While greenhouse gases are produced and exchanged naturally by terrestrial and aquatic ecosystems, reservoirs may increase emissions of carbon dioxide and methane, primarily in the first decade following reservoir creation.

Monitoring at the Wuskwatim Generating Station in the first two years following creation of its reservoir indicated greenhouse gas concentrations were in the same range as pre-project levels. These results were consistent with Manitoba Hydro's expectation that the very small amount of flooding at Wuskwatim, less than one-half of one square kilometre, would have a minimal impact on greenhouse gas production.

Rehabilitating Wuskwatim site

Work continued in the fiscal year to rehabilitate areas disturbed by the construction of the Wuskwatim Generating Station and not required for long-term operation. Approximately 550 hectares of land, including borrow pits and contractor

Named one of Canada's Greenest Employers: 2012, 2013, 2014 work areas, were shaped and graded, permanent erosion control works were established and cleared areas were re-vegetated with native species. Approximately 77 hectares of land have been seeded with native grass species and about 280 000 jack pine, black spruce and white spruce seedlings have been planted to the end of the fiscal year. Tree seedlings will be monitored over the next few years to assess growth and confirm survival.

A commitment to site rehabilitation by the Wuskwatim Power Limited Partnership – a partnership between Manitoba Hydro and the Nisichawayasihk Cree Nation – was set out in the Wuskwatim Generating Station's environmental impact statement.

Codifying agricultural bio-security

A new policy further ensures Manitoba Hydro's construction and maintenance activities on agricultural land do not contribute to the spread of disease, pests and invasive plant species. Developed in consultation with government agencies and industry, the new Agricultural Bio-security Policy formalized long-standing practices and created standard operating procedures that assess the potential bio-security risk, considering factors such as soil conditions and time of year, and prescribes actions to manage the risks. All Manitoba Hydro employees and contractors working on private agricultural land are required to follow these operating procedures.

Tree planting is part of the rehabilitation plan to restore areas affected by construction of the Wuskwatim Generating Station.

Protecting the environment

Collaborating on lake sturgeon

In December, Manitoba Hydro and the government of Manitoba signed a memorandum of understanding that recognized a common interest in the preservation and enhancement of lake sturgeon stocks. The memorandum established an implementation committee to undertake collaborative monitoring and research activities that will increase the knowledge of lake sturgeon in Manitoba. The committee will prepare an annual work plan to guide activities and will prepare a brief annual report highlighting the activities undertaken through the memorandum of understanding.

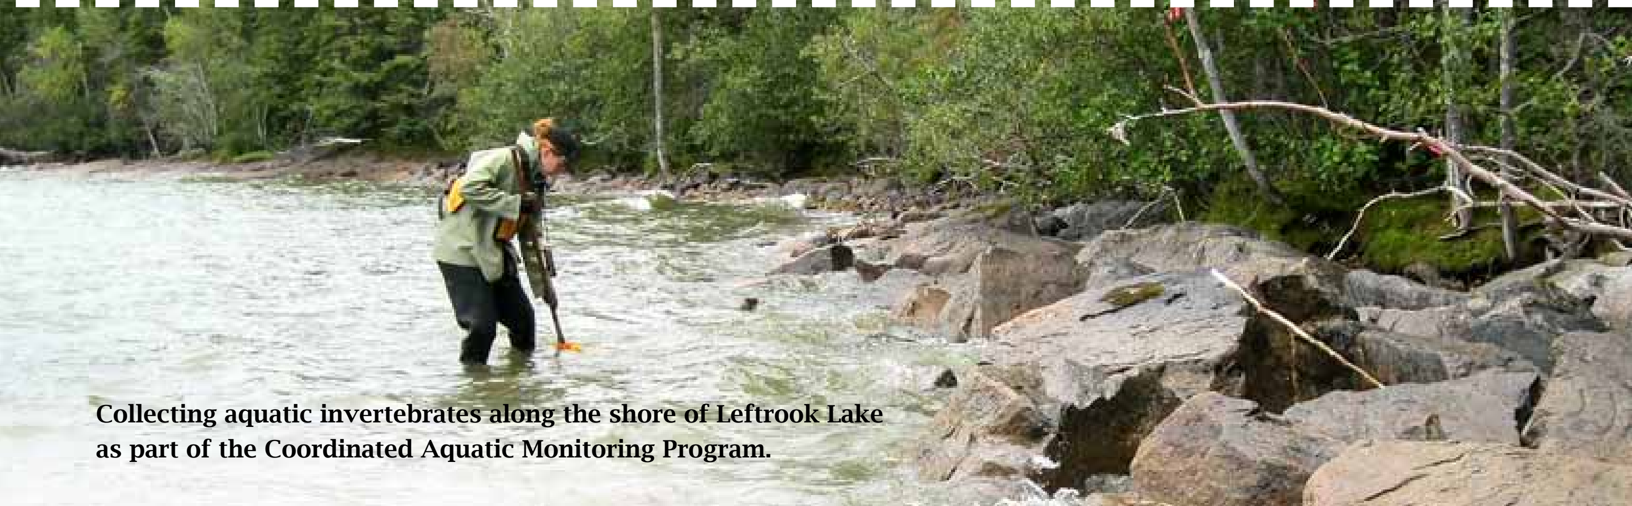
Manitoba Hydro is also providing up to $50 000 annually over five years under its Lake Sturgeon Stewardship and Enhancement Program for cooperative research projects to increase the body of scientific knowledge regarding the life stages of the species. The memorandum has a five-year term with provisions for extension upon mutual agreement.

Describing aquatic health

The Coordinated Aquatic Monitoring Program (CAMP) completed its first three-year monitoring report, based on data collected from 2008 to 2010. The report will be available on the program's new website at www.campmb.com. Manitoba Hydro, in cooperation with the Province of Manitoba, initiated CAMP in 2008 to monitor the aquatic health of water bodies affected by hydroelectric development. Working with experts from the International Institute of Sustainable Development, Fisheries and Oceans Canada and the University of Manitoba, the program is developing indicators for hydrology, water quality, aquatic insects and fish. These indicators will be used to describe the state of aquatic ecosystem health and for reporting to regulatory authorities, stakeholders and the general public.

Preparing for zebra mussels

A zebra mussel monitoring program on the Winnipeg and Red rivers was expanded to include the Jenpeg Generating Station, located on the Nelson River approximately 100 kilometres downstream of Lake Winnipeg. In October, the Province of Manitoba confirmed the presence of zebra mussels in Lake Winnipeg, the first such infestation in Manitoba. An invasive species that multiplies quickly, zebra mussels are one of the only freshwater mollusk that can firmly attach themselves to solid objects. As a result, they can clog intake structures at hydroelectric and thermal generating stations as well as hydraulic control structures. The corporation also initiated a study to review zebra mussel control methods used at stations operated by other North American utilities, identify systems or structures at risk of infestation and identify suitable zebra mussel control techniques.



Collecting aquatic invertebrates along the shore of Leftrook Lake as part of the Coordinated Aquatic Monitoring Program.

Supporting environmental awareness

Work began on a new interactive exhibit at the Manitoba Electrical Museum that explains Manitoba Hydro's environmental assessment activities and approach to environmental issues. Aimed at grade six students, the exhibit includes short videos featuring some of the science that the corporation undertakes before, during and after construction of major projects; highlights ecosystem health and key species such as caribou and sturgeon; and incorporates visual, audio and tactile components to engage learners. The exhibit is scheduled to be open to the public in the summer of 2014.

Manitoba Hydro's Environmental Partnership Fund provided funding or in-kind support to 20 local non-profit organizations in 2013. Established in 1993, the fund provides one time or multi-year contributions to support the development and implementation of environmental education projects with a sustainable development focus. One project receiving support in 2013 was the development of the Lake Friendly, What is Your H20 IQ, educational resource. Designed to provide educators with user-friendly locally relevant information and resources, the workbook explores issues related to water and the Lake Winnipeg watershed.

The Forest Enhancement Program provided funding to 62 projects in 2013 to enhance community forests and support forest education. One of those projects was the planting of 36 fruit trees in the South Osborne Community Orchard, Winnipeg's largest community garden. The orchard will grow fruit, up to 4 500 kilograms in a good harvest year, add diversity to the urban forest and provide a site for educational field trips. Since 1995, over 117 000 trees have been planted as a result of the Forest Enhancement Program.

Checking for zebra mussels at the Seven Sisters Generating Station on the Winnipeg River.

Building relationships

Manitoba Hydro strives to build productive relationships with employees, suppliers and other stakeholders who are integral to our ongoing success.

Contracts awarded to Manitoba companies:

$675 million

Contracts awarded to Aboriginal Manitoba companies:

$288 million

Members of the Walking Wolf Dance Troupe perform at Manitoba Hydro Place as part of the corporation's Aboriginal Awareness Week celebrations.

Building relationships

Building a diverse workforce

Manitoba Hydro continued to work to attract, develop and retain a skilled workforce that reflects the diversity of the province. Those efforts were recognized by the editors of Canada's Top 100 Employers for 2014. Manitoba Hydro was named to their list for the fourth consecutive year and was also identified as one of Canada's Best Diversity Employers.

Manitoba Hydro's Northern and Southern Aboriginal Pre-placement Training programs and the Aboriginal Line Trades Training Program hired a combined 27 new trainees in the fiscal year. These pre-placement programs provide on-the-job training, academic upgrading and mentorship to help Aboriginal candidates acquire skills needed to successfully move into Manitoba Hydro's technical trades training programs. Twenty-three previously hired candidates successfully completed their pre-placement training in the past year and were selected for the power electrician, operating technician or line trades training programs.

Working with the University of Manitoba's Internationally Educated Engineers Qualification Program, Manitoba Hydro continued to support engineers who have trained abroad and want to fulfill the academic requirements of the Association of Professional Engineers and Geoscientists of Manitoba. Two graduates of the university's program were hired permanently into the corporation's Internationally Educated Engineer-in-Training Program. One previous cooperative work term student and subsequent graduate of the program was also hired into a permanent professional engineering position. Since 2004, Manitoba Hydro has awarded two bursaries a year, worth $1 500 each, to students enrolled in the program and provided cooperative work terms.

Strengthening Aboriginal connections

Manitoba Hydro continued to foster business relationships with Aboriginal companies, address the effects of its operations on Aboriginal communities and undertake activities intended to create an appreciation of Aboriginal culture in the workplace.

Using procurement strategies and policies, Manitoba Hydro created business opportunities for Aboriginal enterprises. These strategies included restricted tendering or creation of smaller custom work packages to suit the business capacities of a community in proximity of the work. Of the $675 million in contracts awarded to Manitoba companies in the 2013-14 fiscal year, $288 million was awarded to Manitoba Aboriginal companies.

In September, individual offers of settlement were made to commercial trappers from Moose Lake. The settlements address past, present and future commercial income loss arising from the development of the Grand Rapids Generating Station.

Percentage of employees who are women: 24.5%

Percentage of employees who are Aboriginal: 17.6%

Percentage of employees with disabilities: 9.9%

Percentage of employees who are visible minorities: 7.8%

Manitoba Hydro's Boat Patrol Program, Debris Management Program and Safe Ice Trails Program played integral roles in improving, mitigating and compensating for adverse impacts and providing for safe navigation on waterways affected by hydroelectric development.

The Boat Patrol Program employed about 35 seasonal Aboriginal workers from communities in northern Manitoba for 19 boat patrol crews. These crews mapped and recorded daily routes, marked deadheads and reefs, identified debris work areas, placed hazard markers and gathered floating debris. The Debris Management Program implemented about a dozen community-based contracts for identifying debris work locations on shore and collecting then burning the debris. Under the Safe Ice Trails Program seasonal contract workers, typically resource users hired from Northern Aboriginal Communities, created approximately 2 000 kilometres of ice trails. The trails were then monitored by local Manitoba Hydro employees who mapped trails, tested ice thickness, cleared obstructions and routinely monitored and patrolled to provide safe alternatives to traveling on unchecked routes.

Ongoing promotion of Aboriginal cultural awareness among employees included celebrating National Aboriginal Awareness Week for the eighth consecutive year. Activities between May 22 and 24 included a lunch-time presentation by Commissioner James Wilson of the Treaty Relations Commission of Manitoba; a performance by the Walking Wolf Dance Troupe; and an Aboriginal crafters marketplace at Manitoba Hydro Place that featured a musical performance by employees and teepee teachings by an Aboriginal elder. The corporation also offered Aboriginal Cultural Awareness workshops for employees. Over 110 workshops have been held since 2005 with nearly 2 000 employees participating.

Contributing to communities

Manitoba Hydro continued to work with Project Search, a unique business-partnered transition program for high school students with an intellectual disability. The 10-month program is unique in that students are fully embedded in a business workplace for the duration of their last year of high school. Students started and ended their day in a classroom at Manitoba Hydro Place where they learned employability skills. Between classes, students learned job skills while participating in a variety of work experience assignments. The program is targeted at students whose main goal is employment and who will benefit from career exploration. In June, seven students graduated from the program and from high school.

In 2013, Manitoba Hydro continued to be Canadian Blood Services' largest partner in the province. Employees donated over 1 000 units of blood for the second year in a row, including 133 donations in December

Building relationships

alone – the most donations from a Manitoba organization in one month for all of 2013.

Over 1 200 athletes competed in the Manitoba Hydro Power Smart Winter Games over six days in March. Morden, Winkler and the Rural Municipality of Stanley hosted the athletes who competed in 13 different sports. Manitoba Hydro has sponsored the games since 2002 and been title sponsor since 2006.

In September, Manitoba Hydro representatives participated in the official opening of a 40-kilometre addition to the TransCanada Trail at the Seven Sisters Generating Station on the Winnipeg River. Manitoba Hydro supported the project by allowing the trail to cross over the generating station and dikes as it winds its way between Old Pinawa Dam Provincial Park and Whiteshell Provincial Park.

Other community events supported in 2013-14 included the Power Smart Santa Claus Parade in Winnipeg, the Aurora Winter Fest in Churchill and the Winnipeg Symphony Orchestra's Power Smart Holiday tour which took the symphony to Steinbach, Winkler, Portage la Prairie and the Baker Hutterite Colony near MacGregor.

Helping a neighbour

When one of the worst ice storms in decades hit southern Ontario in December knocking out power to over 300 000 Toronto Hydro customers, Manitoba Hydro was quick to extend an offer of assistance. Within hours of Toronto Hydro accepting, there was a plane load of Manitoba Hydro volunteers ready to go. On Christmas Eve morning, 42 employees flew to Toronto where they worked 12-hour shifts in severe conditions, helping to maintain an around-the-clock response to the storm damage. Toronto Hydro was very appreciative and praised the Manitoba Hydro employees for their work ethic, safety focus and ability to deal with challenging circumstances. All employees returned to Winnipeg on December 31.

Students from St. Laurent School build a bottle opener out of nuts and bolts as part of a Manitoba Hydro recruitment event in the community.

Manitoba Hydro staff return home after helping Toronto recover from a devastating ice storm over the Christmas holiday. Photo by John Woods, Winnipeg Free Press.

Corporate governance

The affairs of Manitoba Hydro are overseen by a board whose members are appointed by the Lieutenant Governor in Council of Manitoba.

The board's primary responsibility is to ensure that the corporation carries out its legislative mandate. The board considers the principles of sustainable development, and Manitoba Hydro's code of ethics, in its decisions. Minutes of board meetings are public, and the corporation's annual report and quarterly financial statements are tabled in the legislature. The annual report is approved by a committee of the Manitoba Legislature. The mandate of the corporation is reviewed by The Crown Corporations Council.

The Audit Committee of the board reviews Manitoba Hydro's integrated financial forecast, and makes recommendations to the board. The Audit Committee reviews whether Manitoba Hydro's quarterly and annual financial statements present fairly the financial position and performance in accordance with generally accepted accounting principles. The Audit Committee confirms whether management has assessed areas of potential significant financial and operational risk and has taken appropriate measures, and the Audit Committee reviews management's systems for ensuring legal compliance. The Audit Committee obtains opinions from external auditors, internal auditors, and management on the quality of internal controls, and verifies that external auditors have performed their duties with sufficient independence from management.

The Human Resources and Governance Committee assists the board with succession planning and human resources issues. The Committee reviews the board's approach to corporate governance with a view to best practices and Manitoba Hydro's mandate.

All of the members of the board sit on the Planning Committee, which approves the corporate strategic plan.

Integrity Program

Manitoba Hydro encourages employees and others to speak up on matters of concern without fear of reprisal, through its Integrity Program. All disclosures under the Integrity Program are protected by strict rules of confidentiality.

Below is a summary of all disclosures received during 2013-14 which allege wrongdoing as defined in The Public Interest Disclosure (Whistleblower Protection) Act:

Total number of disclosures received:	2
Number of disclosures ongoing from 2012-13:	10
Number of disclosures acted upon:	12
Number of disclosures not acted upon:	0
Number of investigations commenced/continued:	12
Number of disclosures that were verified:	3
Number of disclosures that were not verified:	5
Number of disclosures carried forward to 2014-15:	4

Corrective action was taken for each verified incident, as follows:

- Funds were recovered from a service agent for not acting in the corporation's best interests and the contract was terminated.
- An employee received a written warning for abusive comments to a female fellow worker, and counseling was provided to the entire department.
- Two employees each received a five-day suspension and one of them was temporarily demoted for engaging in private work in conflict with their company work.

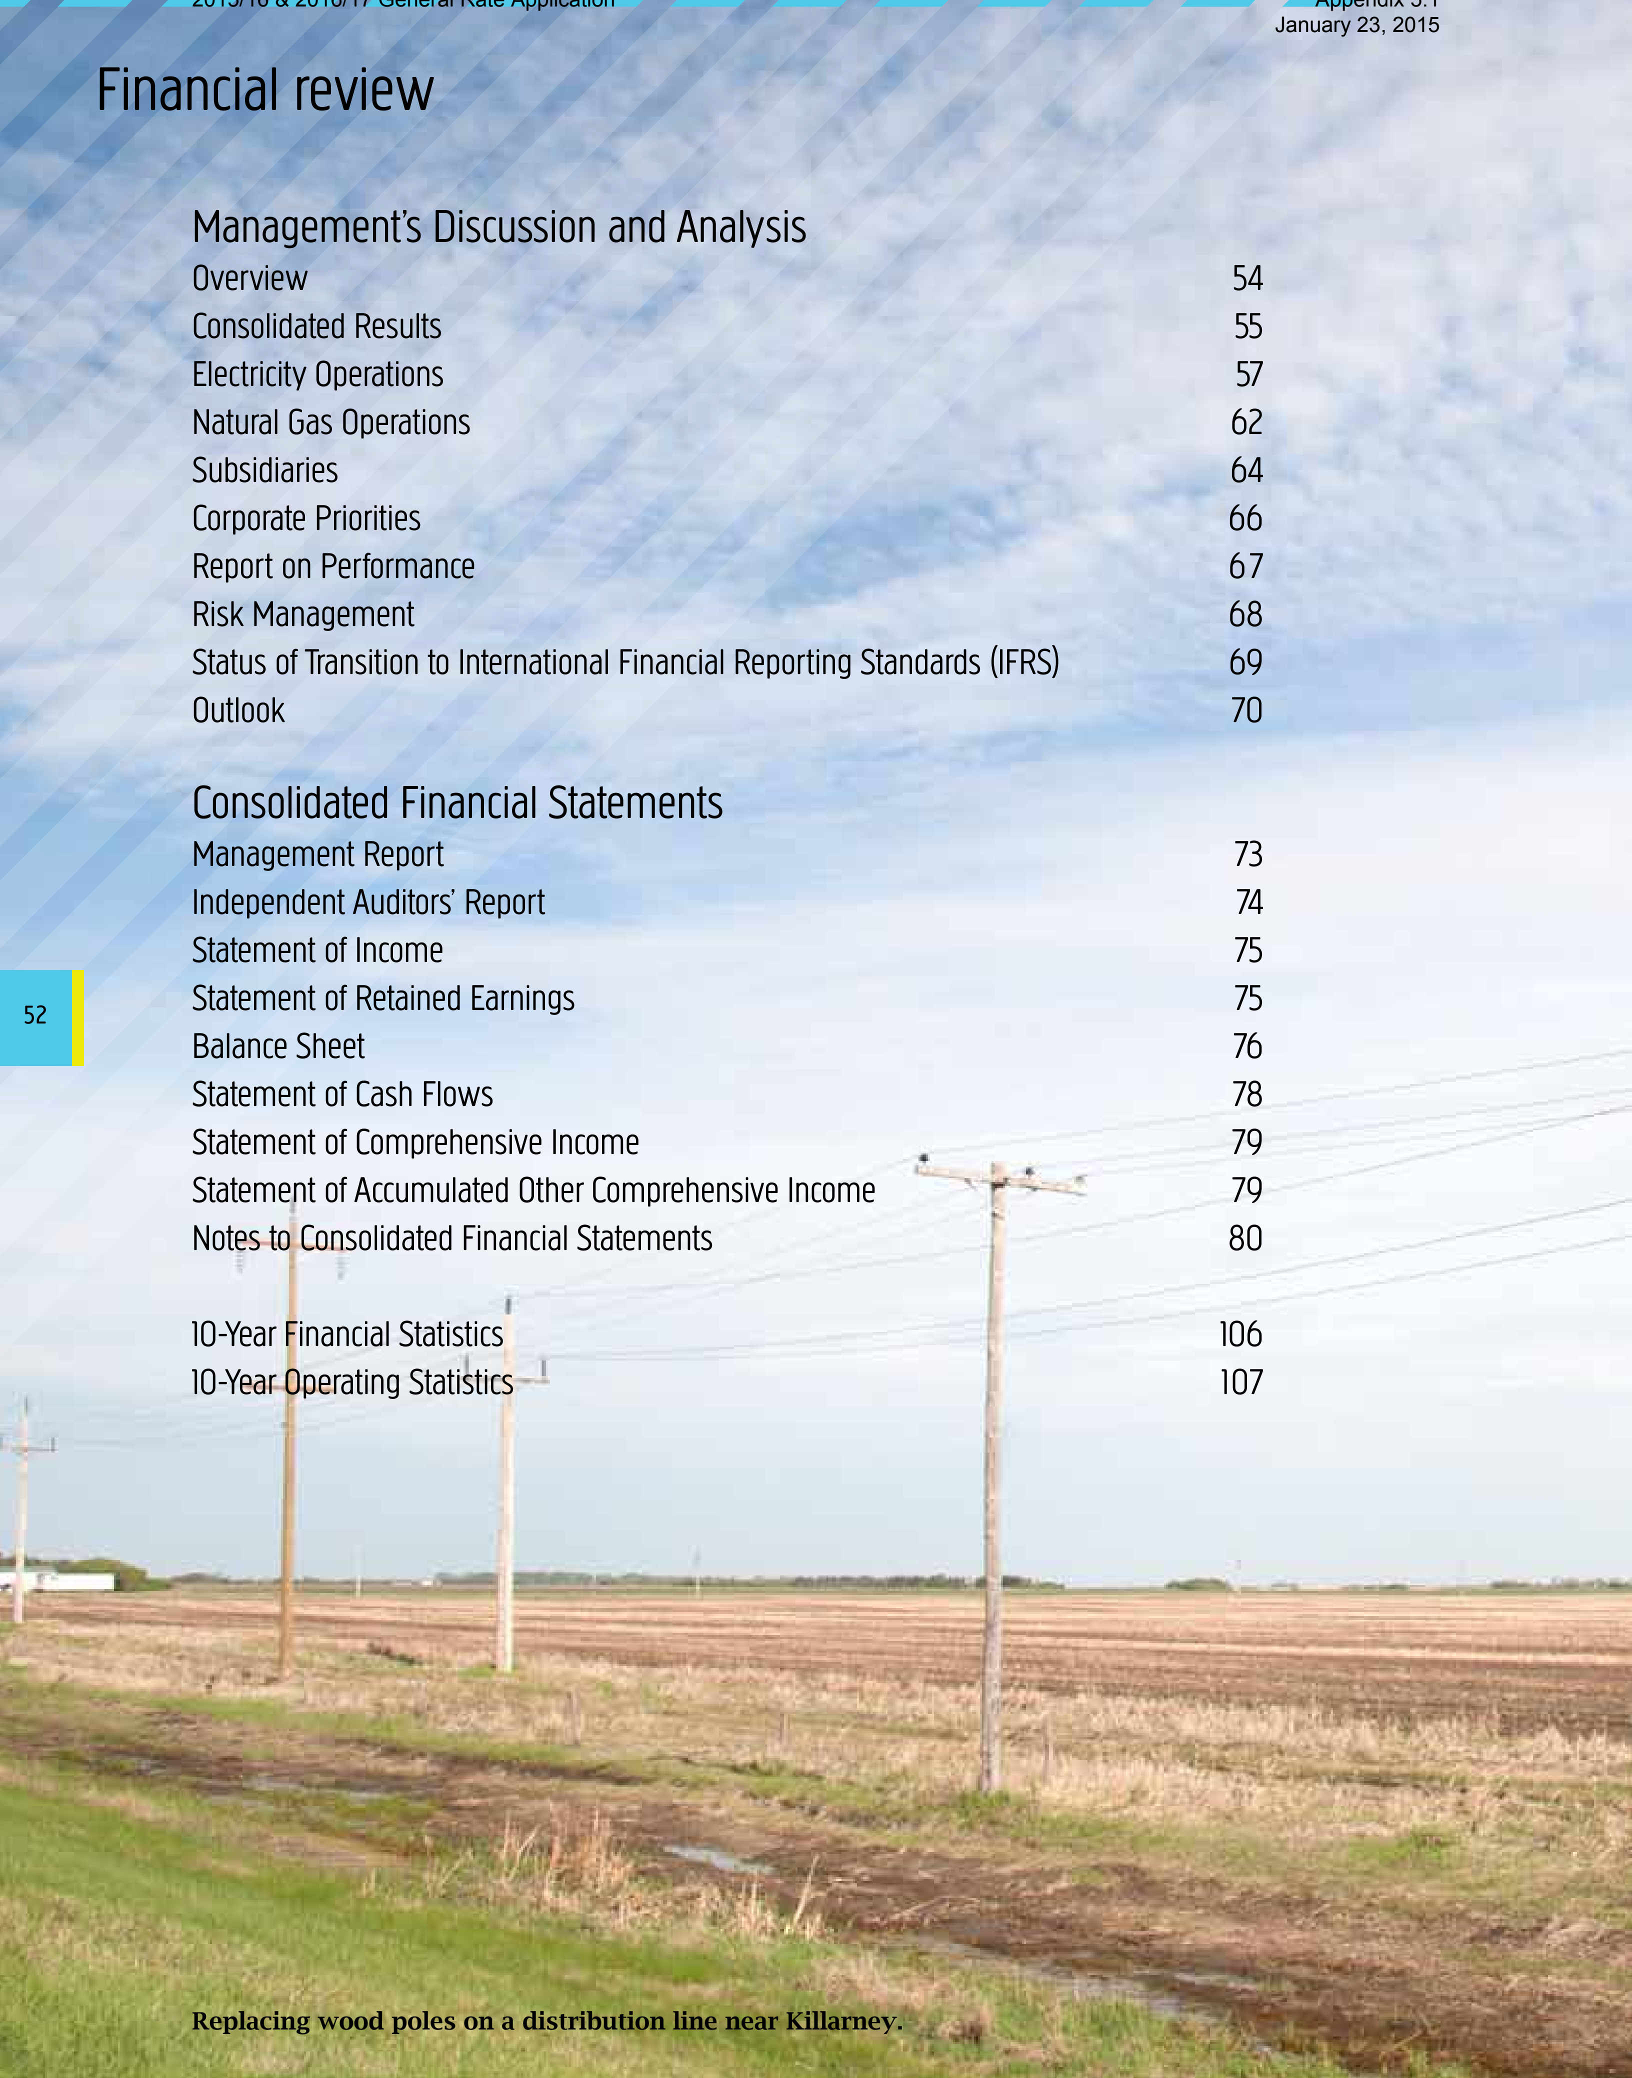
Management's Discussion and Analysis

Consolidated Financial Statements



Replacing wood poles on a distribution line near Killarney.

The Management's Discussion and Analysis (MD&A) section of the Annual Report provides comments on the financial results and operational performance of Manitoba Hydro for the year ended March 31, 2014 with comparative information where applicable. The MD&A also provides an assessment of Corporate risks and contains forward-looking statements regarding conditions and events which may affect financial performance in the future. Such forward-looking statements are subject to a number of uncertainties which are likely to cause actual results to differ from those anticipated. For context, the MD&A should be read in conjunction with the consolidated financial statements and notes.

As a provincially-owned Crown Corporation, Manitoba Hydro's mandate is to provide for the continuance of a supply of energy to meet the needs of Manitoba consumers in the most reliable, economic, and environmentally sustainable manner. In fulfilling its mandate, Manitoba Hydro has assessed all known risks and has established a number of priorities with related measures and targets. In addition to a review of financial and operational performance, the MD&A also reviews Manitoba Hydro's progress towards achieving its strategic priorities.

OVERVIEW

Manitoba Hydro's consolidated net income from electricity and natural gas operations for the fiscal year ended March 31, 2014 was $174 million compared to $92 million in the previous fiscal year. The increase in net income of $82 million was largely attributable to increased revenues from domestic and extraprovincial electricity sales partially offset by higher expenses.

Consolidated net income for the 2014 fiscal year was comprised of net income of $154 million in the electricity sector and net income of $20 million in the natural gas sector. The gas sector net income represented a $12 million improvement over the previous year which was mainly a result of colder weather during the winter of 2013-14 compared to the winter of 2012-13.

Consolidated net income for 2013-14 was higher than the forecasted net income of $136 million largely due to higher than forecast electricity and gas revenues partially offset by higher than forecast power purchases.

Net income of $174 million contributed to the corporation's retained earnings of $2 716 million at March 31, 2014, the highest level of equity in the corporation's history. The interest coverage and capital coverage ratios exceeded the target level while the debt to equity ratio was close to the target level for the year.

CONSOLIDATED RESULTS

The following schedule summarizes Manitoba Hydro's consolidated financial results for the fiscal year ended March 31, 2014 compared to the previous fiscal year:

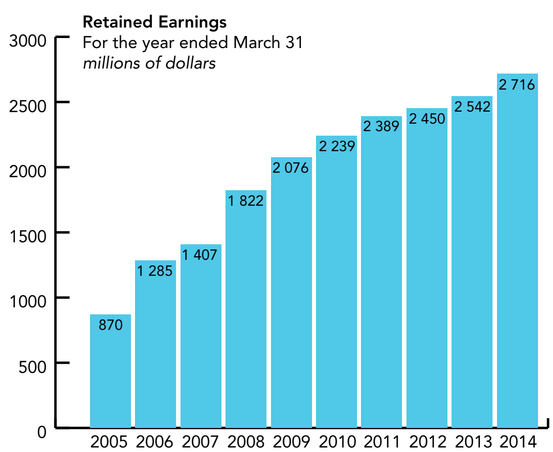
	Electricity		Natural Gas		Consolidated		Change
	2014	2013	2014	2013	2014	2013	
	millions of dollars						
Revenues							
Manitoba (net of cost of gas sold)	1 475	1 410	163	147	1 638	1 557	81
Extraprovincial	439	353	-	-	439	353	86
	1 914	1 763	163	147	2 077	1 910	167
Expenses	1 782	1 692	143	139	1 925	1 831	94
Net income before non-controlling interest	132	71	20	8	152	79	73
Net loss attributable to non-controlling interest	22	13	-	-	22	13	9
Net income	154	84	20	8	174	92	82
Total assets	14 950	13 928	689	614	15 639	14 542	1 097
Retained earnings	2 654	2 500	62	42	2 716	2 542	174
Financial Ratios							
Debt:Equity					76:24	75:25	
Interest coverage					1.28	1.15	
Capital coverage					1.35	1.25	

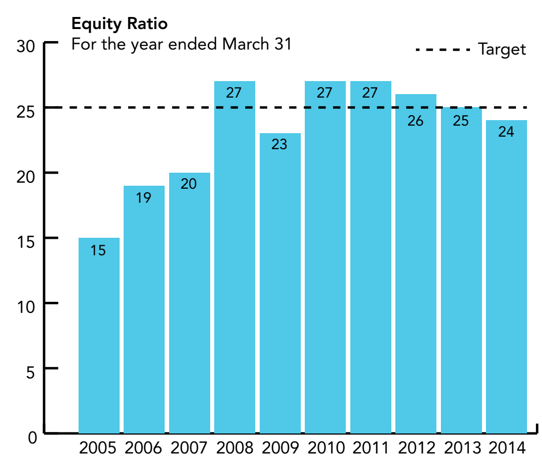
Revenues from consolidated electricity and natural gas operations totaled $2 329 million in 2013-14 compared to $2 092 million in the previous fiscal year. After deducting the cost of gas sold, which is a pass-through cost with no mark-up to customers by Manitoba Hydro, revenues amounted to $2 077 million compared to $1 910 million in the prior year. The $167 million or 8.7% increase in revenues was largely attributable to increased extraprovincial electricity sales due to favourable water conditions and higher export prices, increased domestic electricity sales due to colder weather than the previous year and electricity rate increases.

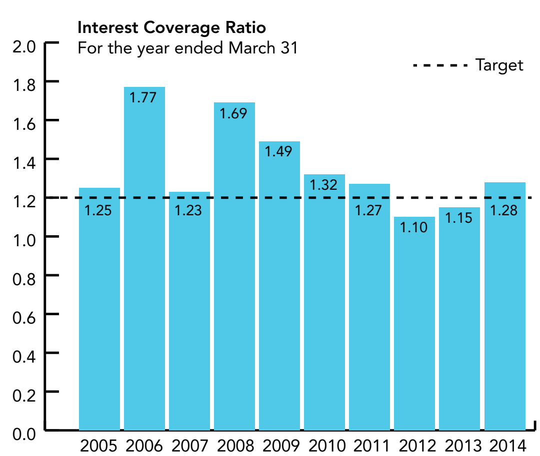
Expenses for electricity and natural gas operations totaled $1 925 million in 2013-14, an increase of $94 million or 5.1% over the previous year. The increase was largely due to a $44 million increase in fuel and power purchased, a $24 million increase in operating and administrative expense and a $19 million increase in depreciation and amortization.

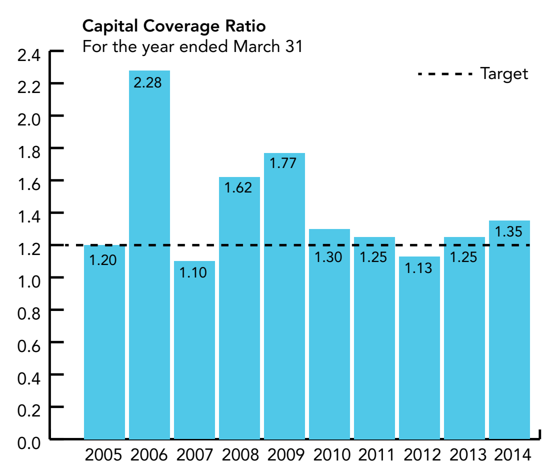
Net loss attributable to non-controlling interest represents Taskinigahp Power Corporation's (TPC) 33% share of the Wuskwatim Power Limited Partnership's (WPLP) operating results for 2013-14. The WPLP has two limited partners, Manitoba Hydro and TPC which is owned beneficially by Nisichawayasihk Cree Nation (NCN) and a General Partner which is a wholly-owned subsidiary of Manitoba Hydro.

Net income from electricity and natural gas operations amounted to $174 million in 2013-14 compared to $92 million in the previous year. The consolidated net income increased retained earnings to $2 716 million at March 31, 2014. As indicated in the accompanying chart, net income of $174 million resulted in the equity ratio being 24% at March 31, 2014, slightly lower than the corporation's target of 25%. The capital coverage ratio of 1.35 exceeded the target of 1.20 and the interest coverage ratio of 1.28 exceeded the target of 1.20.









Financing

Cash provided from operations in 2013-14 was $690 million, an increase of $101 million from the previous year. The increase reflects higher domestic and extraprovincial sales than the previous year.

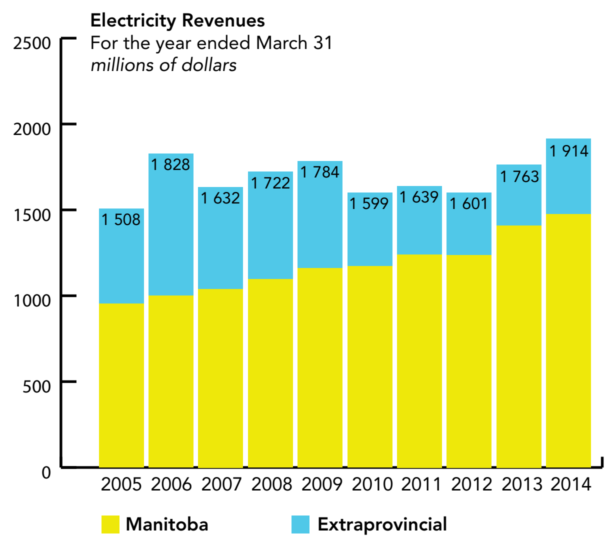
Proceeds from financing arranged by the corporation amounted to $1 320 million in 2013-14 compared to $807 million in the previous year. Current year proceeds were used to fund new capital requirements and to retire long-term debt maturing during the year.

During 2013-14, the corporation retired $613 million of debt comprised of Provincial Advances of $575 million, HydroBonds of $14 million and Manitoba Hydro-Electric Board Bonds of $24 million.

ELECTRICITY OPERATIONS

Electricity Revenues

Electricity revenues totaled $1 914 million, an increase of $151 million or 8.6% from the previous year. The increase was the result of increases of $86 million in extraprovincial revenues and $65 million in domestic revenues. The increase in extraprovincial revenues was primarily due to increases in export volumes resulting from higher generation from stations on the Lower Nelson River due to higher flows than prior year and higher export prices. The increase in domestic revenues was primarily due to higher consumption as a result of one of the coldest winters on record in Manitoba and rate increases.



The breakdown of electricity revenues by customer segment is as follows:

Electricity Revenues and kWh Sales

For the year ended March 31

	2014	2013	% change	2014	2013	% change
	millions of dollars			*millions of kWh*		
Manitoba						
Residential	606	554	9.4	7 889	7 334	7.6
General service	497	465	6.9	7 269	6 877	5.7
Industrial	302	299	1.0	7 199	7 266	(0.9)
Other revenue	70	69	1.4	-	-	-
	1 475	1 387	6.3	22 357	21 477	4.1
1% rate deferral	-	23	-	-	-	-
Manitoba revenue	1 475	1 410	4.6	22 357	21 477	4.1
Extraprovincial	439	353	24.4	10 537	9 087	16.0
	1 914	1 763	8.6	32 894	30 564	7.6

Revenues from electricity sales in Manitoba totaled $1 475 million in 2013-14, an increase of $65 million from the previous year. Electricity consumption in Manitoba was 22 357 million kilowatt-hours, 880 million kilowatt-hours higher than the previous year. The increase in consumption was mainly due to higher heating loads as a result of colder winter weather in 2013-14 and customer growth.

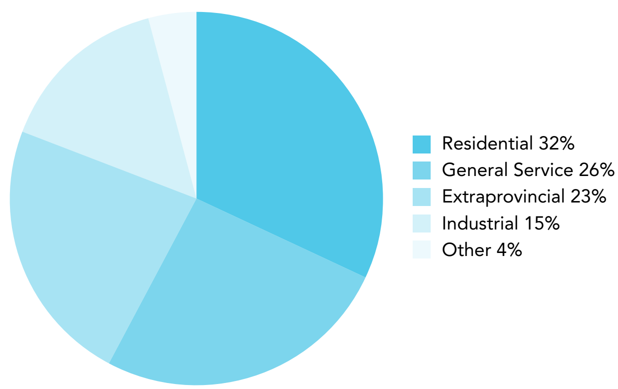
Revenues from sales to residential customers for 2013-14 amounted to $606 million, an increase of $52 million or 9.4% from the previous year. The increase was primarily a result of a higher heating load from colder winter weather, rate increases implemented during the year and increases in the number of residential customers of 6 400 to 486 654, an increase of 1.3% compared to the previous year.

Revenues from general service customers amounted to $497 million in 2013-14, an increase of $32 million or 6.9% from the previous year. The increase was mainly attributable to the rate increases implemented during the year, colder winter weather and an increase of 577 customers.

Revenues from large industrial customers amounted to $302 million, an increase of 1.0% or $3 million from the previous year. The increase was mainly the result of rate increases implemented during the year and an increase of customers partially offset by decreased consumption.

Extraprovincial revenues totaled $439 million in 2013-14, an increase of $86 million from the previous year. The increase reflects higher U.S. sales volumes resulting from higher generation from stations on the Lower Nelson River due to higher flows than prior year and higher export prices partially resulting from favorable foreign exchange rates on U.S. sales. Of the total extraprovincial revenues, $392 million or 89% was derived from the U.S. market, while $47 million or 11% was from sales to Canadian markets.

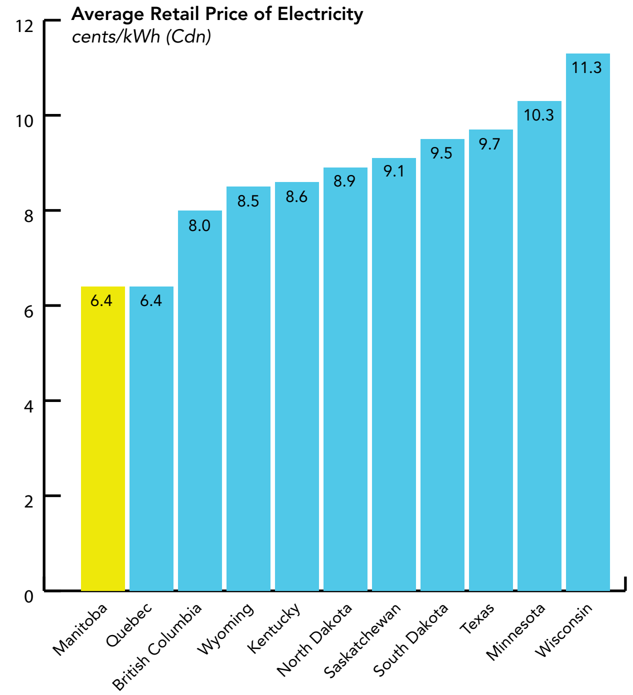
Electricity Revenues
For the year ended March 31, 2014



Electricity Rates

The Public Utilities Board (PUB) issued Order 43/13 on April 26, 2013, which approved a 3.5% increase in electricity rates effective May 1, 2013. The PUB directed that 2.0% of the 3.5% increase be included in general revenues and that 1.5% of the approved rate increase be set aside to be utilized to mitigate rate increases when Bipole III is placed in-service. During the 2013-14 fiscal year $19 million was set aside for this purpose.

Manitoba Hydro's domestic electricity rates continue to be among the lowest overall in North America. This is illustrated in the accompanying chart which was excerpted from utilities' annual reports and United States Department of Energy and Edison Electric Institute publications.



Electricity Expenses

Electricity expenses totaled $1 782 million for 2013-14, an increase of $90 million or 5.3% over the previous year. The increase in expenses was the result of a $44 million increase in power purchased, a $21 million increase in operating and administrative, an $18 million increase in depreciation and amortization, a $10 million increase in capital and other taxes, a $7 million increase in water rentals and assessments and a $6 million increase in other expenses, partially offset by a $16 million decrease in finance expense.

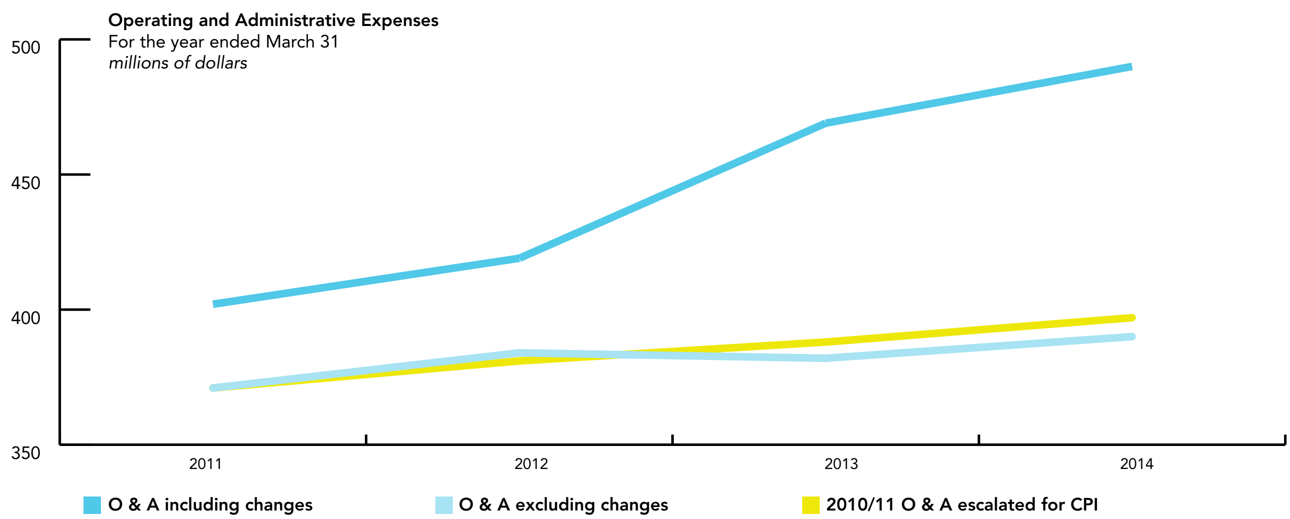
Electricity Expenses

For the year ended March 31

	2014	2013	% change
	millions of dollars		
Operating and administrative	490	469	4.5
Finance expense	436	452	(3.5)
Depreciation and amortization	412	394	4.6
Water rentals and assessments	125	118	5.9
Fuel and power purchased	177	133	33.1
Capital and other taxes	97	87	11.5
Other expenses	36	30	20.0
Corporate allocation	9	9	-
	1 782	1 692	5.3

Operating and administrative expenses are comprised primarily of labour, material and overhead costs associated with operating, maintaining and administering the facilities and programs of the corporation. In 2013-14, operating and administrative expenses for electric operations amounted to $490 million, an increase of $21 million over 2012-13. The increase in operating and administrative expenses was primarily due to higher pension and other benefit costs of $13 million related to changes in discount and mortality rates and greater employer contribution requirements. After adjusting for these changes, the increase in operating and administrative expenses for 2013-14 was $8 million or 1.7% as compared to the previous year.

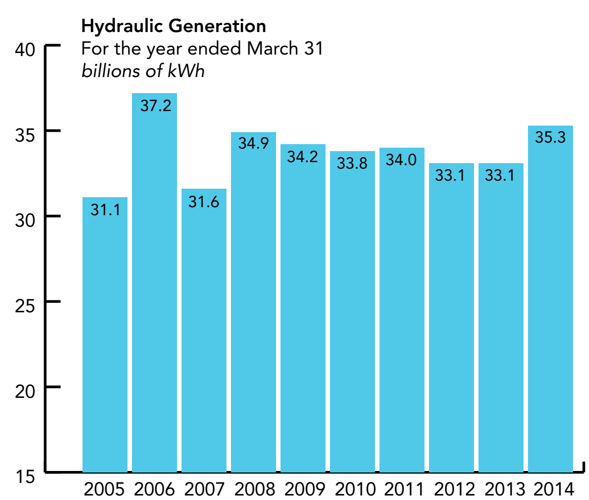
The following graph provides a comparison of the growth in operating and administrative expenses, including and excluding accounting changes as well as changes in the pension and benefit costs, as compared to changes in the consumer price index (CPI).



Finance expense totaled $436 million in 2013-14, a decrease of $16 million or 3.5% from the previous year. The decrease was primarily due to lower interest rates, higher realized foreign exchange gains on U.S. debt and higher recognized gains on the sale of U.S. sinking fund investments. This was partially offset by higher volumes of long-term debt to finance capital expenditures and a weaker Canadian dollar.

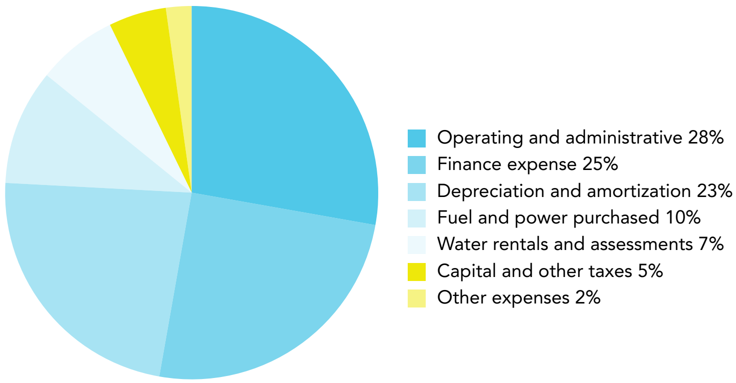
Depreciation and amortization expense amounted to $412 million in 2013-14, an increase of $18 million or 4.6% from the previous year. The increase was mainly attributable to new additions to plant and equipment coming into service, including the Wuskwatim Generating Station which was fully in-service during the 2013-14 fiscal year.

Water rentals and assessments amounted to $125 million in 2013-14, an increase of $7 million from the previous year. The increase reflects greater hydraulic generation due to higher water flows in 2014 compared to the prior year. Hydraulic generation amounted to 35.3 billion kilowatt-hours in 2013-14 compared to 33.1 billion kilowatt-hours in 2012-13.



Fuel and power purchased includes fuel for the thermal generating stations and remote diesel sites, purchases of wind power from the independently-owned St. Leon and St. Joseph wind farms and from electricity imports. Fuel and power purchased was $177 million in 2013-14, an increase of $44 million or 33.1% over 2012-13. The increase in power purchased was primarily the result of higher purchased volumes due to colder weather and higher system merchant purchases due to increased arbitrage opportunities between markets.

Electricity Expenses
For the year ended March 31, 2014



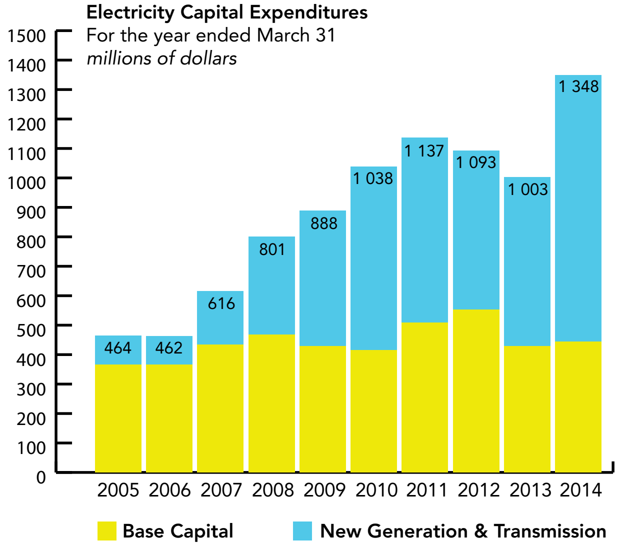
Capital and other taxes amounted to $97 million in 2013-14, an increase of $10 million or 11.5% compared to the previous year. The change was primarily due to increased capital taxes related to additional capital investment and a GST reassessment.

Other expenses include costs associated with the provision of professional consulting, operations, maintenance and project management services to external entities and other miscellaneous write-offs and expenditures. Other expenses amounted to $36 million in 2013-14, an increase of $6 million or 20.0% compared to the previous year. The increase was primarily the result of a write-off of property, plant and equipment under construction.

Electricity Capital Expenditures

Expenditures for capital construction totaled $1 348 million in 2013-14 compared to $1 003 million during the previous fiscal year. Capital expenditures for ongoing plant and equipment requirements, referred to as base capital, amounted to $444 million, an increase of $15 million compared to the previous year. The increase was attributable to higher expenditures on generating station, substation, distribution and transmission upgrades.

Electricity Capital Expenditures
For the year ended March 31
millions of dollars



Major new generation and transmission capital expenditures of $904 million included $318 million related to the Keeyask and Conawapa generation facilities, $225 million related to the Bipole III transmission line, converter stations and collector lines, $237 million towards the Pointe du Bois Spillway replacement and generating station rehabilitation, $74 million for the Riel Station, $15 million related to the Wuskwatim Generating Station and transmission line and $20 million for upgrades to the Kelsey Generating Station.

NATURAL GAS OPERATIONS

Centra Gas Manitoba Inc. (Centra) is a wholly-owned subsidiary of Manitoba Hydro. Centra distributes natural gas to 247 010 residential and 25 218 commercial and industrial customers in Manitoba.

Net income in the gas sector was $20 million in 2013-14 compared to $8 million in the previous fiscal year. The improved financial performance over the previous year was primarily attributable to increased demand due to colder weather during the winter of 2013-14 compared to the winter of 2012-13 and to a 1% distribution rate increase.

Natural Gas Revenues

Revenues from the sale and distribution of natural gas during 2013-14 were $415 million, an increase of $86 million from the previous year. After deducting the cost of gas sold, which is a pass-through cost with no mark-up by Centra, net revenues amounted to $163 million, an increase of $16 million from 2012-13. The increase in net revenue was largely due to colder weather and higher distribution rates compared to the previous year. Natural gas deliveries were 2 280 million cubic metres in 2013-14 compared to 2 049 million cubic metres in 2012-13.

As directed by the PUB, $3.8 million of revenue from 2013-14 was set aside to continue a program targeted to low-income customers and qualifying seniors on fixed incomes to assist in the replacement of low efficiency furnaces with high efficiency furnaces. At March 31, 2014, there is a remaining balance of $18 million in the Furnace Replacement Program.

Natural Gas Revenues and Deliveries

For the year ended March 31

	2014	2013	% change	2014	2013	% change
	millions of dollars			*millions of cubic metres*		
Residential	208	174	19.5	664	602	10.3
Large general service	124	95	30.5	603	523	15.3
Small general service	31	25	24.0	113	100	13.0
Large commercial & industrial	23	18	27.8	156	133	17.3
Interruptible	23	11	109.1	92	93	(1.1)
T-service and other	6	6	-	652	598	9.0
	415	329	26.1	2 280	2 049	11.3

Natural Gas Rates

In accordance with Centra's quarterly rate-setting methodology, annualized rates for natural gas supplied to residential customers changed during 2013-14 as follows:

- May 1, 2013 5.6% increase
- August 1, 2013 1.8% decrease
- November 1, 2013 1.4% increase
- February 1, 2014 6.4% increase

The change in natural gas rates reflects the fluctuations in pricing for natural gas purchased by Centra.

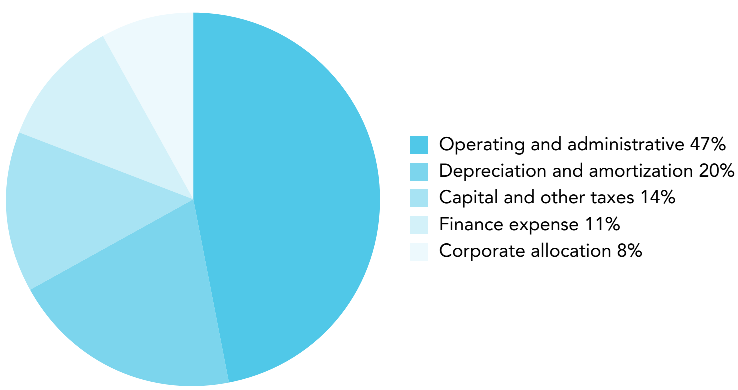
Natural gas prices have been declining since 2009 and while there have been price increases this year, the average bill is still low relative to 10 years ago. Manitoba Hydro's natural gas customers have benefited as a result. The total annual natural gas bill for a typical residential customer in Manitoba in 2013-14 was 17% lower than in 2004.

The PUB approved a general rate increase related to the non-gas costs of operating Centra of approximately 1% effective August 1, 2013. This was the first gas general rate increase implemented by Centra since May 1, 2010.

Natural Gas Expenses

Expenses attributable to the natural gas operations, excluding cost of gas sold amounted to $143 million in 2013-14, which was $4 million higher than the previous year primarily due to an increase of $3 million in operating and administrative expenses relating to pension and other benefits. In addition, there were increases of $2 million in capital and other taxes and $1 million in depreciation and amortization partially offset by a decrease of $2 million in finance expense.

Natural Gas Expenses
For the year ended March 31, 2014



Natural Gas Expenses

For the year ended March 31

	2014	2013	% change
	millions of dollars		
Operating and administrative	67	64	4.7
Finance expense	16	18	(11.1)
Depreciation and amortization	28	27	3.7
Capital and other taxes	20	18	11.1
Corporate allocation	12	12	-
	143	139	2.9

Centra purchased 886 million cubic metres of natural gas based on monthly Alberta indexed pricing, 187 million cubic metres under daily Alberta indexed pricing and 239 million cubic meters from a number of other supply sources. Centra also delivered natural gas on behalf of brokers to 15 703 (2013 – 17 418) customers receiving natural gas under Direct Purchase arrangements.

Centra offers a fixed rate service for primary natural gas supply which allows customers to fix their natural gas rates for terms of up to five years. The fixed rate service is offered to residential and commercial customers. At March 31, 2014 there were 305 customers (2013 – 396 customers) on Centra's fixed rate service. Total natural gas deliveries under this service were 6.0 million cubic metres (2013 – 6.0 million cubic metres).

Natural Gas Capital Expenditures

Capital expenditures in the natural gas sector were $35 million in 2013-14 compared to $34 million in the previous fiscal year. The capital expenditure program relates to new business, system improvement and other expenditures to meet the needs of the natural gas customers.

SUBSIDIARIES

In addition to Centra, Manitoba Hydro has the following wholly-owned subsidiaries involved in energy-related business enterprises:

Manitoba Hydro International Ltd. (MHI) provides professional consulting, operations, maintenance and project management services to energy sectors world-wide, either exclusively or through partnerships. MHI also provides research and development services and products to the electrical power system industry.

Manitoba Hydro Utility Services Ltd. (MHUS) provides meter reading and related services to Manitoba Hydro, Centra and other utilities.

The following table provides a summary of the financial results of the subsidiary companies excluding Centra for the fiscal year ended March 31, 2014 compared to the previous fiscal year:

	MHI		MHUS		Other		Total	
	2014	2013	2014	2013	2014	2013	2014	2013
				millions of dollars				
Revenues	51.1	43.2	4.9	4.6	0.3	1.1	56.3	48.9
Expenses	43.2	38.2	4.9	4.6	0.3	0.2	48.4	43.0
Net income	7.9	5.0	-	-	-	0.9	7.9	5.9

WUSKWATIM POWER LIMITED PARTNERSHIP

The WPLP was formed to carry on the business of developing, owning and operating the Wuskwatim Generating Station and related works, excluding the transmission facilities but including all dams, dikes, channels, excavations and roads. The WPLP has two limited partners, Manitoba Hydro and Taskinigahp Power Corporation, which is owned beneficially by Nisichawayasihk Cree Nation, and a General Partner which is a wholly-owned subsidiary of Manitoba Hydro. The Wuskwatim Generating Station is located at Taskinigahp Falls on the Burntwood River approximately 45 kilometres southwest of Thompson, Manitoba.

The WPLP reported a net loss for 2013-14 of $67 million which is consistent with the expectations for the first full year of operations. This is compared to a net loss of $40 million in 2012-13 for a partial year of operations. The net loss was mainly attributable to an increase in expenses of $49 million partially offset by an increase in revenues of $22 million resulting from the Wuskwatim generation and transmission facilities being in-service for the entire year of 2013-14 versus partial in-service in 2012-13. Manitoba Hydro's 67% share of the loss was $45 million (2013 - $27 million) and TPC's 33% share of the loss was $22 million (2013 - $13 million). At March 31, 2014 total assets for Wuskwatim generation and transmission facilities amounted to $1.6 billion (2013 – $1.6 billion).

CORPORATE PRIORITIES

The Manitoba demand for electricity is continuing to grow and new energy sources are required. To meet this increased demand, Manitoba Hydro's plan continues to include aggressively pursuing demand side options and developing clean, renewable hydro resources.

Natural gas also plays a significant role in meeting Manitoba's energy needs. During the next few years, Manitoba Hydro will be devoting a significant amount of effort in response to major changes in the North American supply and transportation markets.

Manitoba Hydro's top priorities include:

Safety in the workplace

Promoting safety in the workplace and in the actions of the public around our facilities remains Manitoba Hydro's top priority. Manitoba Hydro is committed to continuously improving its safety performance and focusing on strategies to instill a safety and health culture in all corporate activities. In doing so, Manitoba Hydro intends to maintain a steady decline in both workplace accident severity and frequency rates.

Customer value

Providing excellent customer service, high system reliability and affordable rates are fundamental in everything the corporation does. Manitoba Hydro is a leader in promoting conservation, providing numerous Power Smart Programs to assist customers in meeting their energy needs.

Financial strength

Maintaining financial strength is essential in order to make the necessary investments in infrastructure to continue to provide safe and reliable service to customers, financially withstand the risks and uncertainties that are inherent in Manitoba Hydro's operations and to provide customers with long-term rate stability and predictability.

Aboriginal relations

Engaging impacted Aboriginal communities in a positive way is vital to enhance working relationships. The corporation continues to place emphasis on addressing the adverse effects of our operations, fostering an appreciation of Aboriginal culture, developing and maintaining business relationships, providing opportunities in future development projects and implementing initiatives to recruit, develop and retain Aboriginal employees.

Workforce management

Attracting, developing and retaining a highly skilled and motivated workforce that reflects the demographics of Manitoba is critical to the corporation's success.

Protecting the environment

Protecting the environment is an integral part of everything Manitoba Hydro does which is accomplished by integrating environmentally responsible practices in all aspects of the business. Environmental protection is carried out with dedication to monitoring programs, climate change initiatives, and environmental research and development.

Demand side management (DSM)

As the province's population and economy continues to grow, DSM plays a key role in meeting Manitoba's future energy needs in a sustainable manner. These efforts assist customers in using energy more efficiently and result in overall lower energy bills.

REPORT ON PERFORMANCE

The report on performance summarizes progress the corporation is making towards top priorities in achieving operational excellence.

Priorities	Measure	Target / Challenge	2014 Performance
Safety in the workplace	Accident severity rate (days per 200 000 hours worked)	<12	11.1
	Accident frequency rate (accidents per 200 000 hours worked)	<0.6	0.7
	High-risk accidents	0	0
Customer value	System average interruption duration (minutes per year)	<116	106.5
	System average interruption frequency (outages per year)	<1.4	1.26
	Customer satisfaction	>8.4/10 customer satisfaction	7.87
Financial strength	Debt:equity ratio	75:25	76:24
	Interest coverage	>1.20	1.28
	Capital coverage	>1.20	1.35
Workforce management	Women	26%	24.5%
	Aboriginal – corporate	16%	17.6%
	Aboriginal – northern	45%	44.1%
	Persons with disabilities	6%	9.9%
	Visible minorities	7%	7.8%
Protecting the environment	Percentage of electricity generated in Manitoba from renewable resources	≥99%	99.6%
	Total annual GHG emissions	≤520 kt	163 kt
	Repeat environmental audit findings	0 repeat findings	0
Demand side management	Electric energy saved - GWh annual incremental savings	174 GWh	308 GWh
	Electric capacity saved - MW annual incremental savings	201 MW	278 MW
	Natural gas energy saved - in millions of cubic metres saved annually	10 million cubic metres	8.5 million cubic metres

RISK MANAGEMENT

Manitoba Hydro faces a number of risks in the fulfillment of its mission and mandate. These risks are managed through a systematic, proactive and integrated process which is designed to balance the objectives of:

- identifying threats that affect the achievement of the corporation's mission and mandate;
- mitigating the consequences of negative occurrences; and
- taking advantage of opportunities to provide benefits to all stakeholders.

Most risk management efforts are focused on reducing the occurrence of negative events. However, the corporation also has plans in place to reduce the impacts should a negative event occur. These plans are under continual assessment. In addition, all safety and reliability risks are managed through strict adherence to design, construction and operating standards and practices together with extensive public education and employee training programs. A comprehensive Emergency Response Program is also in place to ensure an effective and coordinated response to possible emergencies or natural disasters.

The financial and operational risks associated with the management of an integrated electricity and natural gas utility are significant. These risks include the impacts of new infrastructure development, aging infrastructure maintenance and replacement, weather on supply and demand, price and market uncertainties, interest, inflation and foreign exchange rates, skilled labour availability and costs, increasing regulatory, environmental and legal requirements and accelerated technological change. Manitoba Hydro manages these risks through an integrated control framework and through the maintenance of an adequate level of retained earnings.

Manitoba Hydro's most significant risks are quantified in the following table:

Risk	Potential Financial Impact
Infrastructure	Greater than $2.0 billion
Drought	Greater than $1.6 billion for a five year drought
Loss of export market	Greater than 30% of electricity revenue
Interest rates	Approximately $900 million for a 1% change over 10 years

STATUS OF TRANSITION TO INTERNATIONAL FINANCIAL REPORTING STANDARDS (IFRS)

In February 2013, the Canadian Accounting Standards Board (AcSB) announced an additional optional one-year deferral of IFRS for qualifying entities with rate-regulated activities with year-ends beginning after January 1, 2015. Manitoba Hydro meets the AcSB criteria for deferral and intends to adopt IFRS for its 2015-16 fiscal year with comparative information presented for the 2014-15 fiscal year.

The corporation expects the transition to IFRS to impact accounting, financial reporting and related information systems. Reporting of the conversion status is provided to the Audit Committee of the Manitoba Hydro-Electric Board.

Although IFRS and Canadian Generally Accepted Accounting Principles (GAAP) are premised on a similar conceptual framework, there are a number of differences with respect to recognition, measurement and disclosure. The areas with the highest potential to impact Manitoba Hydro include property, plant and equipment, regulatory assets and liabilities, employee benefits and the transitional requirements upon the adoption of IFRS under the provisions of IFRS 1, First-Time Adoption of IFRS.

On January 30, 2014, the International Accounting Standards Board (IASB) approved a new interim standard IFRS 14, Regulatory Deferral Accounts which is effective January 1, 2016 with earlier adoption permitted. The new standard applies only to entities that are first-time adopters of IFRS, conduct rate-regulated activities and recognize regulatory deferral account balances in their financial statements in accordance with their previous GAAP. Manitoba Hydro's operations fall within the scope of the new interim standard and it will early adopt IFRS 14 upon its transition to IFRS effective April 1, 2015.

In adopting the new interim standard IFRS 14, Manitoba Hydro will:

- continue to use its previous GAAP accounting policies for the recognition, measurement and impairment of regulatory deferral account balances;
- present regulatory deferral account balances as separate line items in the statement of financial position and to present movements in those account balances as a separate line item in the statement of profit or loss and other comprehensive income; and
- provide specific disclosures to identify clearly the nature of, and risks associated with, the rate regulation that has resulted in the recognition of regulatory deferral account balances.

Notably, the new interim standard is only intended to provide temporary guidance until the IASB completes its comprehensive project on Rate-regulated Activities. It is expected that the comprehensive project may take several years to complete.

At this time, it is uncertain as to the final position the IASB will take as part of its Rate-regulated Activities project. In addition, the IASB has a number of ongoing projects on its agenda which may result in changes to existing IFRS prior to the commencement of Manitoba Hydro's 2015-16 fiscal year. Manitoba Hydro continues to monitor and evaluate the impacts of current and prospective IFRS on its accounting policies, financial position and business activities.

OUTLOOK

Manitoba Hydro entered fiscal 2014-15 with above average water storage levels and expectations for the spring runoff for 2014 are above average. However, Manitoba Hydro expects its net income for 2014-15 to be significantly below the level experienced in 2013-14. This results from lower forecast revenue assuming normal winter weather conditions and higher forecast depreciation and finance expense due to continued investment in property, plant and equipment.

Manitoba Hydro has commenced construction of the Bipole III transmission line and is actively planning a number of major projects such as Keeyask and Conawapa generating stations in order to further improve electrical system reliability, to meet the future energy needs of the province and to take advantage of export opportunities. These plans will involve the investment of approximately $20 billion which will generate significant returns for Manitobans over ensuing decades. Construction of the new generating stations will only proceed once firm export sales contracts are secured, extensive consultations with stakeholders and First Nations are concluded and environmental and regulatory approvals are received.

The Bipole III project involves the construction of a new 500-kV high voltage direct current transmission line along with new converter stations, one in the north and another at the southern receiving end. The project is required to improve system reliability and will also provide additional capacity for delivery of existing and proposed hydro-electric generation to southern markets. The Manitoba Environment Act license for Bipole III was issued in August 2013 following the Manitoba Clean Environment Commission (CEC) public hearing and report. Construction has started on the Keewatinoow (northern) converter station, construction power station and line as well as the clearing of the right-of-way for northern segments of the 500-kV transmission line.

In accordance with Manitoba Order in Council No. 128/2013, a Needs For and Alternatives To review is being undertaken by the PUB of the economic and societal justification for Manitoba Hydro's proposed development plan including Keeyask, Conawapa, a new Manitoba to U.S. transmission interconnection and new long-term export sales. Public hearings commenced March 2014 and are expected to conclude in May with a report to be submitted to the Minister responsible for the Public Utilities Board Act by June 2014.

The 695-megawatt Keeyask Generating Station would be built on the Nelson River, 30 kilometres west of Gillam, within the Split Lake Resource Management Area, in partnership with four Keeyask Cree Nations (KCN) – Tataskweyak Cree Nation, War Lake First Nation, Fox Lake Cree Nation and York Factory First Nation. A Keeyask Infrastructure Agreement was negotiated between Manitoba Hydro and KCN enabling an early start to the construction of the access road to the site and the construction camp. The CEC hearings to review the Keeyask Generating Station project's environmental impact statement concluded in January 2014. The Minister of Conservation and Water Stewardship released the report on the Keeyask Generation Project in May 2014 recommending that the project be issued a license under the Manitoba Environment Act. Pending regulatory approvals, construction is scheduled to start in the summer of 2014 with an in-service date of 2019.

The proposed 1 485-megawatt Conawapa Generating Station would be built approximately 90 kilometres downstream of Gillam and 28 kilometres downstream of the Limestone Generating Station, in the Fox Lake Resource Management Area on the Lower Nelson River. A formal planning process is underway with the communities in the vicinity of the project, including Fox Lake Cree Nation, York Factory First Nation, Tataskweyak Cree Nation, War Lake First Nation and Shamattawa First Nation. Activities are progressing to complete the Project Description, preliminary engineering and the environmental assessment. Discussions on Aboriginal participation are taking place with Fox Lake Cree Nation and are expected to begin with the rest of the in-vicinity communities during fiscal 2015. The Environmental Impact Statement is scheduled to be filed by the end of 2015 with the potential start of construction in January 2018, which would support an earliest in-service date of 2026.

Manitoba Hydro's highly successful Power Smart Program continues to encourage residential, commercial and industrial customers to use energy more efficiently through 30 programs and initiatives. These efforts work towards making permanent shifts in the Manitoba marketplace for long-term adoption of energy efficient technologies and practices. The Program forecasts higher energy savings through expanding on the existing portfolio with a more aggressive approach to delivering existing programs and by pursuing additional emerging opportunities. The Program is projected to achieve electric energy and demand savings of 6 286 GWh and 1 635 MW per year and natural gas savings of 211 million cubic metres per year by 2028-29. These energy savings are expected to reduce greenhouse gas emissions by over 4.6 million tonnes annually while providing Manitobans with lower energy bills from the installation of energy savings measures and the continued sale of the conserved energy on export markets. The reduced energy consumption forecast in the plan represents 12.7% of the estimated electric load forecast offsetting 66% of projected load growth during this period and 5.3% of the estimated natural gas volume forecast by 2028-29, further reducing natural gas consumption in Manitoba.

MANAGEMENT REPORT

For the year ended March 31, 2014

The accompanying consolidated financial statements and all additional information contained in the Annual Report are the responsibility of management and have been approved by the Manitoba Hydro-Electric Board. The consolidated financial statements have been prepared by management in accordance with accounting principles generally accepted in Canada, applied on a basis consistent with that of the preceding year. In management's opinion, the consolidated financial statements have been properly prepared within reasonable limits of materiality, incorporating management's best judgment regarding all necessary estimates and all other data available up to June 25, 2014. The financial information presented elsewhere in the Annual Report is consistent with that in the consolidated financial statements.

Management maintains internal controls to provide reasonable assurance that the assets of the corporation are properly safeguarded and that the financial information is reliable, timely and accurate. An internal audit function independently evaluates the effectiveness of these internal controls on an ongoing basis and reports its finding to management and to the Audit Committee of the Board.

The responsibility of the external auditors, Ernst & Young LLP, is to express an independent, professional opinion on whether the consolidated financial statements are fairly presented in accordance with Canadian generally accepted accounting principles. The Auditors' Report outlines the scope of their examination and their opinion.

The Audit Committee of the Board is comprised of five members, the majority of whom are members of the Manitoba Hydro-Electric Board. The Audit Committee of the Board meets with the external auditors, representatives of the Auditor General's Office, the internal auditors and management to satisfy itself that each group has properly discharged its respective responsibility and to review the consolidated financial statements before recommending approval by the Board. The internal and external auditors have full and unrestricted access to the Audit Committee, with or without the presence of management. The Board reviews the Annual Report in advance of its release and approves its content and authorizes its publication.

On behalf of management:

Scott A. Thomson, CA
President and Chief Executive Officer

Darren B. Rainkie, CA, CBV
Vice-President, Finance and Regulatory

INDEPENDENT AUDITORS' REPORT

To the Board of Directors of
Manitoba Hydro-Electric Board

We have audited the accompanying consolidated financial statements of **Manitoba Hydro-Electric Board**, which comprise the consolidated balance sheet as at March 31, 2014 and the consolidated statements of income, comprehensive income, accumulated other comprehensive income, retained earnings and cash flows for the year then ended, and a summary of significant accounting policies and other explanatory information.

Management's responsibility for the consolidated financial statements

Management is responsible for the preparation and fair presentation of these consolidated financial statements in accordance with Canadian generally accepted accounting principles, and for such internal control as management determines is necessary to enable the preparation of consolidated financial statements that are free from material misstatement, whether due to fraud or error.

Auditors' responsibility

Our responsibility is to express an opinion on these consolidated financial statements based on our audit. We conducted our audit in accordance with Canadian generally accepted auditing standards. Those standards require that we comply with ethical requirements and plan and perform the audit to obtain reasonable assurance about whether the consolidated financial statements are free from material misstatement.

An audit involves performing procedures to obtain audit evidence about the amounts and disclosures in the consolidated financial statements. The procedures selected depend on the auditors' judgment, including the assessment of the risks of material misstatement of the consolidated financial statements, whether due to fraud or error. In making those risk assessments, the auditors consider internal control relevant to the entity's preparation and fair presentation of the consolidated financial statements in order to design audit procedures that are appropriate in the circumstances, but not for the purpose of expressing an opinion on the effectiveness of the entity's internal control. An audit also includes evaluating the appropriateness of accounting policies used and the reasonableness of accounting estimates made by management, as well as evaluating the overall presentation of the consolidated financial statements.

We believe that the audit evidence we have obtained is sufficient and appropriate to provide a basis for our audit opinion.

Opinion

In our opinion, the consolidated financial statements present fairly, in all material respects, the financial position of Manitoba Hydro-Electric Board as at March 31, 2014 and the results of its operations and its cash flows for the year then ended in accordance with Canadian generally accepted accounting principles.

CONSOLIDATED STATEMENT OF ACCUMULATED OTHER COMPREHENSIVE INCOME

For the year ended March 31

	2014	2013
	millions of dollars	
Accumulated other comprehensive income, beginning of year	299	327
Other comprehensive loss	(203)	(28)
Accumulated other comprehensive income, end of year	96	299

The accompanying notes are an integral part of the consolidated financial statements.

NOTE 1 NATURE OF THE ORGANIZATION

The Manitoba Hydro-Electric Board and the Manitoba Power Commission were amalgamated in 1961 by enactment of *The Manitoba Hydro Act* to form a Crown Corporation in the Province of Manitoba named Manitoba Hydro (the corporation). Manitoba Hydro's mandate is to provide for the continuance of a supply of energy adequate for the needs of the province and to engage in and to promote economy and efficiency in the development, generation, transmission, distribution, supply and end-use of energy. The head office of the corporation is located at 360 Portage Avenue, Winnipeg, Manitoba.

NOTE 2 SIGNIFICANT ACCOUNTING POLICIES

Basis of Presentation - These consolidated financial statements were prepared in accordance with Canadian Generally Accepted Accounting Principles (GAAP) as set forth in Part V of the Chartered Professional Accountants (CPA) Canada Handbook – Accounting - Pre-Changeover Accounting Standards and include the significant accounting policies described hereafter.

Consolidation - These consolidated financial statements include the accounts of Manitoba Hydro and its wholly-owned subsidiaries including Centra Gas Manitoba Inc. (Centra), Minell Pipelines Ltd., Manitoba Hydro International Ltd. (MHI), Manitoba Hydro Utility Services Ltd. (MHUS), Teshmont LP Holdings Ltd. (which has a 40% ownership interest in the Teshmont Consultants Limited Partnership) and 6690271 Manitoba Ltd. (a subsidiary which was formed to participate in the development of a new transmission interconnection to the U.S.). These consolidated financial statements also include Manitoba Hydro's 67% ownership interest in the Wuskwatim Power Limited Partnership (WPLP) and its 75% ownership in the Keeyask Hydropower Limited Partnership. For purposes of consolidation, all significant intercompany accounts and transactions have been eliminated.

Rate-Regulated Accounting - The prices charged for the sale of electricity and natural gas within Manitoba are subject to review and approval by the Public Utilities Board of Manitoba (PUB). The rate-setting process is designed such that rates charged to electricity and natural gas customers recover costs incurred by Manitoba Hydro in providing electricity and gas service. As permitted under Canadian GAAP, the corporation applies standards issued by the Financial Accounting Standards Board (FASB) in the United States as another source of Canadian GAAP. FASB Accounting Standards Codification Section 980 – Regulated Operations, represents the standard Manitoba Hydro applies for rate-regulated accounting. These accounting policies differ from enterprises that do not operate in a rate-regulated environment. Such accounting policies allow for the deferral of certain costs or credits which will be recovered or refunded in future rates. These costs or credits would otherwise have been included in the determination of net income in the year that the cost or credit is incurred. Manitoba Hydro refers to such deferred costs or credits as regulated assets or regulated liabilities (Note 13) which are generally comprised of the following:

- Power Smart programs - The costs of the corporation's energy conservation programs, referred to as Power Smart, are deferred and amortized on a straight-line basis over a period of 10 years.

- Site restoration costs - Site restoration costs, other than those for which an asset retirement obligation has been established, are deferred and amortized on a straight-line basis over a period of 15 years.

- Deferred taxes - Taxes paid by Centra (July 1999) as a result of its change to non-taxable status on acquisition by Manitoba Hydro, have been deferred and are being amortized on a straight-line basis over a period of 30 years.

- Acquisition costs - Costs associated with the acquisition of Centra (July 1999) and Winnipeg Hydro (September 2002) have been deferred and are being amortized on a straight-line basis over a period of 30 years.

- Regulatory costs - Costs associated with regulatory hearings are deferred and amortized on a straight-line basis over periods up to 5 years.

- Purchased gas variance accounts - Accounts are maintained to recover/refund differences between the actual cost of gas and the cost of gas incorporated into rates charged to customers as approved by the PUB. The difference between the recorded cost of natural gas and the actual cost of natural gas is recovered or refunded in future rates.

- Demand side management (DSM) deferral - In Board Orders 43/13 and 85/13, the PUB directed that the differences between actual and planned spending on electric and gas DSM for the 2012-13 and 2013-14 fiscal years be recorded in a regulatory deferral account. The cumulative differences for 2012-13 and 2013-14 have been recorded as a regulated liability with an offsetting balance recorded as a regulated asset. The disposition of this regulatory deferral will be determined at a future PUB proceeding.

Manitoba Hydro's other significant accounting policies are as follows:

a) **Property, Plant and Equipment**

Property, plant and equipment is stated at cost which includes direct labour, materials, contracted services, a proportionate share of overhead costs and interest applied at the average cost of debt. Interest is allocated to construction until a capital project becomes operational or a decision is made to abandon, cancel or indefinitely defer construction. Once the transfer to in-service property, plant and equipment is made, interest allocated to construction ceases and depreciation and interest charged to operations commences.

b) **Depreciation**

Depreciation is provided on a straight-line remaining-life basis. The major components of generating stations are depreciated over the lesser of the remaining life of the major component or the remaining life of the associated generating station.

The range of estimated service lives of each major asset category is as follows:

Generation	-	Hydraulic	20 - 125 years
	-	Thermal	5 - 65 years
Transmission lines			10 - 85 years
Substations			15 - 65 years
Distribution			10 - 75 years
Other			5 - 100 years

Provision for removal costs of major property, plant and equipment is charged to depreciation expense on a straight-line basis over the remaining service lives of the related assets. Retirements of these assets, including costs of removal, are charged to accumulated depreciation with no gains or losses reflected in operations. The estimated service lives and removal costs of the assets are based upon depreciation studies conducted periodically by the corporation.

c) **Asset Retirement Obligations**

Asset retirement obligations are measured initially at fair value in the period in which the obligations are incurred, provided that a reasonable estimate of the fair value can be made. The present value of the estimated retirement cost is added to the carrying amount of the related asset. In subsequent periods, the estimated retirement cost is amortized over the useful life of the asset and the carrying value of the liability is increased to recognize increases in the liability's present value with the passage of time.

d) **Materials and Supplies**

Materials and supplies are valued at the lower of average cost or net realizable value.

e) **Contributions in Aid of Construction**

Contributions are required from customers whenever the costs of extending service exceed specified construction allowances. Contributions are amortized on a straight-line basis over the estimated service lives of the related assets.

f) **Revenues**

Manitoba electricity and gas sales are recognized upon delivery to the customer and include an estimate of energy deliveries not yet billed at year-end.

Extraprovincial revenues are recorded upon the delivery of energy.

Other revenue is recorded on the delivery of the related good or service, over the term of the contract for maintenance and lease contracts or on a percentage of completion basis for fixed price contracts.

g) **Cost of Gas Sold**

Cost of natural gas sold is recorded at the same rates charged to customers.

h) **Employee Future Benefits**

Manitoba Hydro provides future benefits, including pension and other post-retirement benefits, to both existing and retired employees. Pension plans include the Civil Service Superannuation Board (CSSB) plan, the Enhanced Hydro Benefit Plan (EHBP), three Centra curtailed pension plans and the Winnipeg Civic Employee Benefits Program (WCEBP). MHUS is a matching employer under the Civil Service Superannuation Act and MHI sponsors a defined contribution group registered retirement plan.

The costs and obligations of pension and other post-retirement benefits are calculated by an independent actuary using the accrued benefit actuarial cost method and reflect management's best estimate of future compensation increases, service lives, inflation rates and expected rate of return on plan assets. Pension expense is comprised of the cost of pension benefits provided during the year, the amortization of past service benefits, experience gains and losses and expected returns on fund assets net of interest on the obligation. The amount of expected returns on fund assets is based on market related values using a five-year moving average. The unamortized present value of past service benefits and actuarially determined experience gains or losses are recognized in the consolidated financial statements as assets or liabilities.

The corporation utilizes the "corridor method" of amortizing actuarial gains and losses. The amortization of experience gains and losses is recognized only to the extent that the cumulative unamortized net actuarial gain or loss exceeds 10% of the greater of the accrued benefit obligation and the fair market value of plan assets at the beginning of the year. When required, the excess of the cumulative gain or loss balance is amortized over the expected average remaining service life of the employees covered by the plan.

Pension and long-term disability expenses pertaining to the former Winnipeg Hydro employees are recognized at the time contributions are made to the WCEBP, which maintains the funds and obligations relating to these employees in its financial records.

Other employee benefits earned by employees include vacation, vested sick leave, severance and a retirement health spending plan. Where applicable, the future costs of these benefits are based on management's best estimates.

i) **Comprehensive Income**

Comprehensive income consists of net income and other comprehensive income (OCI). OCI includes unrealized gains and losses arising from changes in the fair value of available-for-sale assets and changes in the foreign exchange rate for U.S. denominated long-term debt and interest payments in effective cash flow hedging relationships. Such amounts are recorded in accumulated OCI (AOCI) until the criteria for recognition in net income are met.

j) **Financial Instruments**

All financial instruments are measured at fair value on initial recognition as of the trade date. Transaction costs are included in the initial carrying amount of financial instruments. Measurement in subsequent periods depends on the classification of the instrument. Financial instruments are classified into one of the following five categories: held-to-maturity investments, loans and receivables, held-for-trading, available-for-sale or other financial liabilities.

Financial instruments classified as loans and receivables and other financial liabilities are measured at amortized cost using the effective interest method of amortization. Available-for-sale financial assets are measured at fair value with unrealized gains and losses recorded in OCI until the instrument is derecognized or impaired. Translation gains and losses on available-for-sale financial assets in a hedging relationship with financial liabilities are credited or charged to finance expense. Held-for-trading financial instruments are measured at fair value and all gains and losses are included in income in the period in which they arise.

k) **Foreign Currency Translation**

Revenues and expenditures resulting from transactions in foreign currencies are translated into Canadian dollar equivalents at exchange rates in effect at the transaction dates.

Long-term monetary assets and liabilities denominated in foreign currencies are translated into Canadian dollars at the exchange rate prevailing at the consolidated balance sheet date. Translation gains and losses are credited or charged to finance expense in the current period except for long-term debt obligations in hedging relationships with future export revenues. Translation gains and losses for long-term debt obligations in hedging relationships with future export revenues are recorded in OCI until such time that the hedged export revenues are realized, at which time accumulated exchange gains and losses are credited or charged to finance expense.

Current monetary assets and liabilities denominated in foreign currencies are translated into Canadian dollars at the exchange rate prevailing as at the consolidated balance sheet date. Any exchange gains and losses on the translation of current monetary assets and liabilities are credited or charged to finance expense in the current period.

l) **Derivatives**

The corporation does not engage in derivative trading or speculative activities. All derivative instruments are carried at fair value on the consolidated balance sheet with the exception of those that were entered into for the purpose of physical receipt or delivery in accordance with the corporation's expected normal purchases and sales. Changes in the fair value of derivatives that are not designated in a hedging relationship and do not qualify for the normal purchase and sale exemption are recorded in net income.

m) **Hedges**

The corporation has designated cash flow and fair value hedges linking financial instruments to specific assets and forecasted transactions. Long-term cash flow hedges have been established between U.S. long-term debt balances and future U.S. export revenues as well as between U.S. interest payments on dual currency bonds and future U.S. export revenues. A fair value hedge relationship has also been established between U.S. long-term debt balances and U.S. sinking fund investments. The corporation documents the relationship between the hedging instrument and the hedged item and assesses at inception, and on an ongoing basis, the effectiveness of the hedging relationship.

n) **Debt Discounts and Premiums**

Debt discounts and premiums are amortized to finance expense using the effective interest method.

o) **Cash and Cash Equivalents**

Cash and cash equivalents include cash on hand and short-term, highly liquid investments that are readily convertible to known amounts of cash and which are subject to an insignificant risk of changes in value.

p) **Goodwill and Intangible Assets**

Goodwill represents the amount of the corporation's investments in Centra and Winnipeg Hydro over and above the fair market value of the identified net assets acquired. The goodwill balance is evaluated annually to determine whether any impairment has occurred. An impairment would be recognized if it was determined that the carrying value of the corporation's investments in Centra or Winnipeg Hydro exceeded the present value of the future cash flows from these investments. Should impairment occur, it would be recorded as a charge against operations in the year of impairment.

Intangible assets include computer software, application development costs, land easements and transmission rights. Intangible assets are recorded at cost. The cost of computer software and application development includes software, direct labour, materials, contracted services, a proportionate share of overhead costs and interest during development applied at the average cost of debt. Intangible assets with finite useful lives are amortized over their useful lives on a straight-line basis. The expected useful lives are as follows:

Computer software and application development	5 – 10 years
Land easements	75 years
Transmission rights	1 – 12 years

The estimated service lives of intangible assets are based upon depreciation studies conducted periodically by the corporation. The transmission rights are amortized over the contractual period plus a one-term renewal.

q) **Non-Controlling Interest**

Non-controlling interest represents the outstanding ownership interests attributable to third parties in the corporation's limited partnerships. The portion of the equity not owned by the corporation is reflected as non-controlling interest within the equity section of the consolidated balance sheet. The portion of the net income or net loss not attributed to the corporation is recorded as a non-controlling interest in the consolidated statement of income.

r) **Use of Estimates**

The preparation of consolidated financial statements in accordance with Canadian GAAP requires management to make estimates and assumptions that affect amounts reported in the consolidated financial statements. Actual amounts could differ from those estimates, but differences are not expected to be material.

NOTE 3 ACCOUNTING CHANGES

Future Accounting Changes

International Financial Reporting Standards (IFRS)

In February 2008, the Canadian Accounting Standards Board (AcSB) announced that publicly accountable enterprises would be required to adopt IFRS in place of Canadian GAAP for fiscal years beginning on or after January 1, 2011. In October 2009, the Public Sector Accounting Board confirmed that government business enterprises such as Manitoba Hydro would be required to follow IFRS for periods beginning January 1, 2011.

Although IFRS and Canadian GAAP are premised on a similar conceptual framework, there are a number of differences with respect to recognition, measurement and disclosure. The areas with the highest potential to impact Manitoba Hydro include property, plant and equipment, regulatory assets and liabilities, employee benefits and the transitional requirements upon the adoption of IFRS under the provisions of IFRS 1, First-Time Adoption of IFRS.

In May 2010, the International Accounting Standards Board (IASB) issued the omnibus Improvements to IFRS, which includes an amendment to IFRS 1 for entities with rate-regulated activities. The amendment applies to first-time adopters by offering an optional exemption to use the carrying amount of property, plant and equipment and intangible assets as deemed cost of those assets on the transition date. This exemption eliminates the requirement to retrospectively adjust opening property, plant and equipment and/or intangible asset balances for costs that would otherwise not qualify for capitalization under IFRS. Manitoba Hydro intends to apply this exemption.

In September 2010, the AcSB implemented changes to Part I of the CPA Canada Handbook – International Financial Reporting Standards allowing qualifying entities with rate-regulated activities to be permitted, but not required, to defer their adoption of IFRS for one year. In March 2012, September 2012 and February 2013, the AcSB announced additional optional one-year deferrals of IFRS for qualifying entities with rate-regulated activities. Manitoba Hydro meets the AcSB criteria for deferral and intends to adopt IFRS for its 2015-16 fiscal year with comparative information presented for the 2014-15 fiscal year.

On January 30, 2014, the IASB issued the interim standard IFRS 14 *Regulatory Deferral Accounts* for rate-regulated activities effective January 1, 2016 with earlier adoption permitted. Manitoba Hydro will early adopt the interim standard upon transition to IFRS effective April 1, 2015 and will continue to recognize regulatory deferral accounts for its financial reporting.

At this time, it is uncertain as to the final position the IASB will take as part of its Rate-Regulated Activities project. In addition, the IASB has a number of on-going projects on its agenda which may result in modifications to existing IFRS prior to the commencement of Manitoba Hydro's 2015-16 fiscal year. Manitoba Hydro continues to monitor and evaluate the impacts of current and prospective IFRS on its accounting policies, financial position and business activities.

NOTE 4 EXTRAPROVINCIAL REVENUES

U.S. extraprovincial revenues were translated into Canadian dollars at exchange rates in effect at the date of the

	2014	2013
	millions of dollars	
United States	392	312
Canada	47	41
	439	353

transaction. The average effective exchange rate for the year was $1.00 U.S. = $1.05 Canadian (2013 - $1.00 U.S. = $1.00 Canadian).

NOTE 5 FINANCE EXPENSE

	2014	2013
	millions of dollars	
Interest on debt	654	636
Interest capitalized	(142)	(141)
Investment income	(24)	(11)
Realized foreign exchange (gains) losses on debt in cash flow hedges	(19)	2
Realized losses on revaluation of dual currency bonds	2	3
	471	489

Included in interest on debt is $99 million (2013 - $93 million) related to the Provincial Debt Guarantee Fee. The fee during the year was 1.0% of the total outstanding debt guaranteed by the Province of Manitoba (2013 - 1.0%).

NOTE 6 DEPRECIATION AND AMORTIZATION

	2014	2013
	millions of dollars	
Depreciation of property, plant and equipment	375	359
Amortization of regulated assets	45	42
Amortization of intangible assets	22	22

	2014	2013
	millions of dollars	
Materials and supplies	81	72
Natural gas inventory	-	21
	81	93

NOTE 11 SINKING FUND INVESTMENTS

Manitoba Hydro is legislated under *The Manitoba Hydro Act* to make annual sinking fund payments to the Province of Manitoba of not less than 1% of the principal amount of the outstanding debt on the preceding March 31 and 4% of the balance in the sinking fund at such date. Payments to the sinking fund during the year were $209 million (2013 - $107 million). Income earned on sinking fund investments is included with investment income for the year.

Sinking funds are invested in government bonds and the bonds of highly rated corporations and financial institutions.

	2014	2013
		millions of dollars
U.S. investments	111	272
Canadian investments	-	58
Premium on purchase of sinking fund investments	-	22
	111	352

U.S. investments have a weighted average term to maturity of 10 days (2013 - 4.0 years) and an effective yield to maturity of 0.1% (2013 – 3.7%). U.S. investments are translated into Canadian dollars at the exchange rate prevailing as at the consolidated balance sheet date, $1.00 U.S. = $1.11 Canadian (2013 - $1.00 U.S. = $1.02 Canadian). The March 31, 2014 balance includes nil (2013 - $29 million) of unrealized fair value gains. Canadian investments have a weighted average term to maturity of 1 day (2013 - 1 day) and an effective yield to maturity of 1.0% (2013 - 1.1%).

NOTE 12 GOODWILL AND INTANGIBLE ASSETS

	2014			2013		
			millions of dollars			
	Cost	Accumulated amortization	Net	Cost	Accumulated amortization	Net
Intangible assets						
Computer software and application development	222	120	102	210	105	105
Land easements	80	14	66	72	13	59
Transmission rights	8	3	5	5	1	4
	310	137	173	287	119	168
Goodwill	108	-	108	108	-	108
	418	137	281	395	119	276

The additions to intangible assets for the year totaled $30 million (2013 - $31 million). In total, intangible assets of $24 million (2013 - $23 million) were amortized to operations during the year.

NOTE 13 REGULATED ASSETS AND REGULATED LIABILITIES

		2014	2013
		millions of dollars	
Regulated assets			
Power Smart programs	- electric	184	172
	- gas	54	47
Purchased gas variance accounts		39	-
Site restoration costs		36	35
Deferred taxes		27	29
Acquisition costs		19	20
Regulatory costs		1	3
		360	306
Regulated liabilities			
DSM deferral		22	-
Purchased gas variance accounts		-	24
		22	24

If the corporation was not subject to rate regulation, the costs associated with the regulated assets would be charged to operations in the period that they were incurred and net income for 2014 would have been increased by $7 million (2013 – increased by $4 million).

In total, regulated assets of $49 million (2013 - $46 million) were amortized to operations during the year.

The corporation passes all costs related to the purchase and transportation of natural gas on to its customers without markup. If the corporation were not subject to rate regulation, the purchased gas variance accounts would not be maintained and the actual cost of gas would be expensed in the period incurred. If actual gas costs were expensed and sales rates were not adjusted accordingly, net income would have decreased by $63 million (2013 - decreased by $6 million).

NOTE 14 OTHER LONG-TERM ASSETS

	2014	2013
	millions of dollars	
Advances to St. Joseph Windfarm Inc. (excluding current portion)	218	227
Advances to Taskinigahp Power Corporation (Note 25)	112	105
Accrued benefit asset (Note 21)	90	122
Contract receivables	86	81
Affordable Energy Fund (Note 24)	11	15
	517	550

The St. Joseph wind farm is owned by Pattern Energy and operated by St. Joseph Windfarm Inc. Financing for the wind farm was provided partly by Manitoba Hydro. In accordance with the loan agreement, Manitoba Hydro provided advances of $250 million, which will be repaid with interest over 20 years. In addition, Manitoba Hydro has provided access to a $10 million reserve loan facility. The corporation signed a 27-year power purchase agreement with St. Joseph Windfarm Inc. in March 2010.

NOTE 15 LONG-TERM DEBT

	2014	2013
	millions of dollars	
Advances from the Province of Manitoba		
represented by debenture debt of the Province	10 683	9 775
Manitoba HydroBonds	169	55
Manitoba Hydro-Electric Board Bonds	158	182
	11 010	10 012
Less: Current portion of long-term debt	408	656
	10 602	9 356
Adjustment to carrying value of dual currency bonds	(12)	(20)
Debt discounts and premiums	(96)	22
Transaction costs	(34)	(29)
	10 460	9 329

During the year, the corporation arranged long-term financing of $1 320 million (2013 - $807 million). The current year financing was in the form of Provincial Advances with the majority at fixed interest rates.

Included in the current portion of long-term debt are $259 million (2013 - $617 million) of debt maturities and $149 million (2013 - $39 million) of floating-rate Manitoba HydroBonds with maturity dates in 2016 and 2018. Floating rate Manitoba HydroBonds are redeemable at the option of the holder.

Long-term debt is guaranteed by the Province of Manitoba, with the exception of Manitoba Hydro-Electric Board Bonds in the amount of $65 million (2013 - $73 million) issued for mitigation projects.

Debt principal amounts (excluding adjustments to the carrying value of dual currency bonds, transaction costs, debt discounts and premiums) and related yields are summarized by fiscal years of maturity in the following table:

					2014	2013
		millions of Canadian dollars				
Years of Maturity	Canadian	Cdn. Yields	U.S.	U.S. Yields	Total	Total
2015	298	2.6%	110	2.7%	408	210
2016	313	4.3%	-	-	313	313
2017	311	3.4%	-	-	311	308
2018	331	6.8%	-	-	331	331
2019	905	5.6%	442	10.0%	1 347	1 319
	2 158	5.0%	552	10.0%	2 710	2 481
2020-2024	1 125	3.6%	1 326	6.5%	2 451	2 044
2025-2029	510	6.1%	-	-	510	510
2030-2034	990	8.8%	-	-	990	989
2035-2039	1 425	4.9%	-	-	1 425	1 425
2040-2044	1 600	4.4%	-	-	1 600	1 350
2045-2063	1 324	4.1%	-	-	1 324	557
	9 132	4.9%	1 878	7.1%	11 010	9 356

Included in the above Canadian maturity amounts is one dual currency bond with the principal amount repayable in Canadian currency and interest payments denominated in U.S. currency. The dual currency bond matures in the 2025-26 fiscal year in the amount of $130 million Canadian.

U.S. debt is translated into Canadian dollars at the exchange rate prevailing at the consolidated balance sheet date, $1.00 U.S. = $1.11 Canadian (2013 - $1.00 U.S. = $1.02 Canadian).

NOTE 16 ASSET PURCHASE OBLIGATION

Effective September 3, 2002, the corporation acquired the net assets of Winnipeg Hydro from the City of Winnipeg. The asset purchase obligation represents the net present value of payments to the City of Winnipeg of $16 million per annum in perpetuity.

NOTE 17 OTHER LONG-TERM LIABILITIES

	2014	2013
	millions of dollars	
Mitigation liability (Note 23)	229	235
Accrued benefit liability (Note 21)	188	174
Refundable advances from customers	102	96
Transmission community development initiatives	67	15
Asset retirement obligations	13	9
Affordable Energy Fund (Note 24)	11	15
Other	5	6
	615	550

The corporation recorded liabilies for the transmission community development initiatives for both the Wuskwatim transmission line and the Herblet Lake transmission line as outlined in the Wuskwatim Project Development Agreement of $16 million (2013 – $15 million) and for the Bipole III community development initiatives of $51 million (2013 – nil). These funds will be used for community development purposes by eligible First Nations and small or remote northern communities in the vicinity of the transmission lines.

Asset retirement obligations continue to be recognized for the future decommissioning of the Brandon Thermal Generating Station and for the partial decommissioning of the Pointe du Bois Generating Station spillway. The corporation estimates the undiscounted cash flows required to settle the asset retirement obligations are approximately $21 million (2013 - $17 million), $15 million (2013 - $15 million) of which is expected to be incurred in 2024 to decommission the Brandon Thermal Generating Station and $6 million (2013 - $2 million) is expected to be incurred by March 2015 for the partial decommissioning of the Pointe du Bois Generating Station spillway. No funds are being set aside to settle the asset retirement obligations.

NOTE 18 CONTRIBUTIONS IN AID OF CONSTRUCTION

	2014	2013
	millions of dollars	
Contributions in aid of construction	362	340
Bipole III contribution	19	-
	381	340

Contributions are required from customers whenever the costs of extending service exceed specified construction allowances. Contributions are amortized on a straight-line basis over the estimated service lives of the related assets.

In Order 43/13, dated April 26, 2013, the PUB directed that 1.5% of the approved 3.5% rate increase effective May 1, 2013 be set aside to be utilized to mitigate the required rate increases when Bipole III is placed in-service. During the 2013-14 fiscal year $19 million was set aside for this purpose. The period over which this balance will be recognized into net income will be determined by the PUB at a future regulatory proceeding.

NOTE 19 FINANCIAL INSTRUMENTS

The carrying amounts and fair values of the corporation's non-derivative financial instruments at March 31 were as follows:

	2014		2013	
Financial Instruments	Carrying value	Fair value	Carrying value	Fair value
	millions of dollars			
Held-for-trading				
Cash and cash equivalents	142	142	32	32
Loans and receivables				
Accounts receivable and accrued revenue	520	520	421	421
Interest receivable	-	-	4	4
Available-for-sale				
Sinking fund investments	111	111	352	352
Other financial liabilities				
Long-term debt (including current portion)	10 868	12 592	9 985	12 335
Accounts payable and accrued liabilities	561	561	397	397
Accrued interest	100	100	103	103
Asset purchase obligation	207	319	207	343

The fair value measurement of financial instruments is classified in accordance with a hierarchy of three levels, based on the type of inputs used in making these measurements:

Level 1 - Quoted prices in active markets for identical assets and liabilities;
Level 2 - Inputs other than quoted prices that are observable in active markets for the asset or liability; and
Level 3 - Inputs for the asset or liability that are not based on observable market data.

Financial instrument measurements are Level 1 measurements with the exception of the long-term debt and the asset purchase obligation that are Level 2 measurements and certain derivative instruments of nominal value associated with wholesale power marketing activities that are Level 3 measurements. Fair value Level 2 measurements are derived from quoted market yields at the close of business on the consolidated balance sheet date for similar instruments available in the capital market. Level 3 measurements are based on internally developed valuation models which are consistent with valuation models developed by other market participants in the wholesale power markets. The carrying values of all other financial assets and liabilities approximate their fair values.

Financial Risks

During the normal course of business, Manitoba Hydro is exposed to a number of financial risks including credit and liquidity risks and market risk resulting from fluctuations in foreign currency, interest rates and commodity prices. Risk management policies, processes and systems have been established to identify and analyze financial risks faced by the corporation and its subsidiaries, to set risk tolerance limits, establish controls and to monitor risk and adherence to policies. An integrated risk management plan has been developed and reviewed by the Manitoba Hydro-Electric Board to ensure the adequacy of the risk management framework in relation to the risks faced by the corporation. The nature of the financial risks and Manitoba Hydro's strategy for managing these risks has not changed significantly from the prior year.

a) Credit Risk

Credit risk is the risk that one party to a financial instrument will cause a financial loss to the other party by failing to discharge an obligation. Manitoba Hydro is exposed to credit risk related to sinking fund investments, short-term investments and pension fund investments. The corporation limits its exposure to credit risk by only investing in government-guaranteed bonds, highly rated investments and well-diversified investment portfolios.

The corporation is also exposed to credit risk related to domestic and export energy sales. Credit risk related to domestic sales is mitigated by the large and diversified electric and gas customer base. Credit risk in the export power market is mitigated by establishing credit requirements, conducting standard credit reviews of all counterparties and setting and monitoring exposure limits for each of these counterparties. Letters of credit and netting provisions are also in place to further mitigate credit risk. The maximum exposure to credit risk related to domestic and export energy sales is its fair value.

The value of the corporation's aged accounts receivable and related bad debt provisions are presented in the following table:

	Manitoba	Extraprovincial	2014 Total	2013 Total
		millions of dollars		
Under 30 days	370	41	411	342
31 to 60 days	25	-	25	25
61 to 90 days	9	-	9	8
Over 90 days	27	-	27	26
	431	41	472	401
Provision at end of year	(9)	-	(9)	(9)
Total accounts receivable	422	41	463	392

The provision for bad and doubtful accounts is reviewed annually, based on an estimate of aged receivables that are considered uncollectible.

b) Liquidity Risk

Liquidity risk refers to the risk that Manitoba Hydro will not be able to meet its financial obligations as they come due. The corporation meets its financial obligations when due through cash generated from operations, short-term borrowings, long-term borrowings advanced from the Province of Manitoba and sinking fund withdrawals.

The following is an analysis of the contractual undiscounted cash flows payable under financial liabilities and derivative liabilities as at the consolidated balance sheet date:

	Carrying value	2015	2016	2017	2018	2019	2020 and thereafter
				millions of dollars			
Non-derivative financial liabilities							
Accounts payable and accrued liabilities	561	561	-	-	-	-	-
Asset purchase obligation	207	16	16	16	16	16	16*
Long-term debt**	10 968	1 067	977	975	994	1 942	15 725
		1 644	993	991	1 010	1 958	15 741
Derivative financial liabilities							
Commodity derivatives							
Fixed price swap contracts	-	-	-	-	-	-	-
		-	-	-	-	-	-
		1 644	993	991	1 010	1 958	15 741

*per year in perpetuity
**including current portion and interest payments

c) Market Risk

Market risk is the risk that the fair value or future cash flows of a financial instrument will fluctuate because of changes in market prices. Manitoba Hydro is exposed to three types of market risk: foreign exchange risk, interest rate risk and commodity price risk associated with the price of electricity and natural gas. Manitoba Hydro continually monitors its exposure to these risks and may use hedges or derivative contracts to manage these risks.

i. Foreign Exchange Risk

Manitoba Hydro has exposure to U.S. dollar foreign exchange rate fluctuations primarily through the sale and purchase of electricity in the U.S. and through borrowing in U.S. markets. This exposure is managed through a long-term natural hedge between U.S. dollar cash inflows from export revenues and U.S. dollar cash outflows for long-term coupon and principal payments.

To mitigate annual net income impacts due to foreign exchange rate fluctuations, long-term cash flow hedges have been established between U.S. long-term debt balances and future U.S. export revenues as well as between U.S. interest payments on dual currency bonds and future U.S. export revenues. Accordingly, translation gains and losses for U.S. long-term debt obligations in effective hedging relationships with future export revenues, are recognized in other comprehensive income until future hedged U.S. export revenues are realized, at which time the associated gains or losses in accumulated other comprehensive income are recognized in net income. For the year ended March 31, 2014, unrealized foreign exchange translation losses of $155 million (2013 - $31 million losses) were recognized in other comprehensive income and $19 million net gains (2013 - $2 million losses) were reclassified from other comprehensive income into net income.

Manitoba Hydro also has a fair value hedging relationship between U.S. long-term debt balances and U.S. sinking fund investments. Offsetting foreign exchange translation gains and losses on these items are recognized in net income.

In addition to natural hedging relationships, cross currency swap arrangements transacted by the Province of Manitoba on the corporation's behalf are utilized to manage exchange rate exposures and as a means to capitalize on favourable financing terms in either U.S. or Canadian capital markets. Cross currency agreements represent an exchange of principal and/or interest flows denominated in one currency for principal and/or interest flows denominated in another. Such transactions effectively amend the terms of the original debt obligation with the Province of Manitoba with the swapped debt arrangement.

As at March 31, 2014, a change in the Canadian dollar of plus (minus) $0.10 relative to the U.S. dollar would decrease (increase) net income by $0.6 million (2013 - $0.4 million), while other comprehensive income would increase (decrease) by $160 million (2013 - $177 million).

ii. Interest Rate Risk

Interest rate risk is the risk that the future cash flows of a financial instrument will fluctuate due to changes in market interest rates. Manitoba Hydro is exposed to interest rate risk associated with temporary investments, floating rate long-term debt and fixed rate long-term debt maturing within 12 months, less sinking fund withdrawals, offset by the change in interest capitalization. As at March

31, 2014, an increase or decrease of 1% in the interest rate would reduce or increase net income, respectively, by $15 million (2013 - $15 million), with no impact to other comprehensive income.

Interest rate swap agreements transacted by the Province of Manitoba on the corporation's behalf are utilized to manage the fixed and floating interest rate mix of the total debt portfolio, interest rate exposure and related overall cost of borrowing. Interest rate swap agreements represent an agreement between two parties to periodically exchange payments of interest without the exchange of the principal amount upon which payments are based. The Province of Manitoba may also enter into forward start interest rate swap arrangements where the agreement to exchange interest payments commences at some future date. In either swap arrangement, the terms of the debt advanced by the Province of Manitoba to the corporation are amended by the swap.

iii. Commodity Price Risk

The corporation is exposed to electricity price risk that results from volatility of market prices and natural gas price risk through its purchase of gas for delivery to customers throughout Manitoba. The corporation mitigates commodity price risk through its limited use of derivative financial instruments restricted to contracts for differences, forward power sales contracts and natural gas price swaps. Manitoba Hydro does not use derivative contracts for trading or speculative purposes.

The corporation has entered into forward power sales contracts for 50 400 megawatt hours of electricity until June 2014 and natural gas price swaps until July 2016 to purchase 87 450 gigajoules of natural gas. These contracts are reported as derivatives and carried at fair value on the consolidated balance sheet. The unrealized fair value gains of financial derivative contracts as at March 31 are as follows:

	2014	2013
	millions of dollars	
Commodity derivative contracts	2	-

Fair values of forward sales contracts are calculated using the monthly forward electricity prices at pricing points specified in the contracts. Fair values of price swaps are calculated using the monthly forward AECO price as reported by the Natural Gas Exchange as at March 31, 2014.

NOTE 20 CAPITAL MANAGEMENT

Manitoba Hydro manages its capital structure to ensure that there is sufficient equity to absorb the financial effects of adverse circumstances and to ensure continued access to stable low-cost funding for capital projects and ongoing operational requirements.

The corporation monitors its capital structure on the basis of its equity ratio. Manitoba Hydro's long-term target is to achieve a minimum equity ratio of 25%. It is recognized that the equity ratio target may not be achieved during years of major investment in the generation and transmission system.

The corporation's equity ratio as at March 31 was as follows:

	2014	2013
	dollars are in millions	
Long-term debt, net of sinking fund investments	10 349	8 977
Current portion, long-term debt	408	656
Less: Cash and cash equivalents	(142)	(32)
Net debt	10 615	9 601
Retained earnings	2 716	2 542
Accumulated other comprehensive income	96	299
Contributions in aid of construction	381	340
Non-controlling interest	73	95
Total equity	3 266	3 276
Equity ratio	24%	25%

Manitoba Hydro issues debt for its capital requirements under the authority of *The Manitoba Hydro Act* and *The Loan Act*. *The Manitoba Hydro Act* grants the corporation the power to issue up to $500 million of short-term promissory notes. Manitoba Hydro submits annual requests under *The Loan Act* for the necessary borrowing authority for new capital requirements and the refinancing of any maturing long-term debt. The majority of Manitoba Hydro's long-term debt is obtained through advances by the Province of Manitoba.

NOTE 21 EMPLOYEE FUTURE BENEFITS

Manitoba Hydro employees are eligible for pension benefits under the CSSB defined benefit plan that provides pension benefits based on years of service and on the average earnings of the five best years. The CSSB plan requires the corporation to contribute approximately 50% of the pension disbursements made to retired employees. All current employees participating in the CSSB plan are eligible for enhanced pension benefits under the EHBP. The EHBP improves the pension formula used to calculate pension for active service accrued after June 1, 2006. In addition, the former employees of Centra are entitled to pension benefits earned under the Centra curtailed pension plans. The former Winnipeg Hydro employees continue to earn benefits under the WCEBP in which, upon the acquisition of Winnipeg Hydro, Manitoba Hydro became a participating employer. The WCEBP is also a defined benefit plan that provides pension benefits based on years of service and on the average earnings of the five best years.

The CSSB manages the corporation's pension funds (MH Pension Fund and EHBP) on behalf of the corporation. The assets related to the Centra curtailed pension plans are held in trust by State Street Trust Co. of Canada. The assets and liabilities of the WCEBP are not reflected on Manitoba Hydro's consolidated balance sheet.

MHUS employees are eligible for pension benefits under the CSSB defined benefit plan. As a matching employer under the Civil Service Superannuation Act, MHUS is required to match employee contributions at a prescribed rate into the Civil Service Superannuation Fund (CSSF) pool of assets. MHUS' pension expense is recognized at the time contributions are made to the fund. Manitoba Hydro does not carry a pension asset or obligation on its consolidated financial statements related to the MHUS defined benefit plan.

MHI sponsors a defined contribution group registered retirement plan. MHI matches 100% of the employee contributions at prescribed contribution rates. The cost of the pension benefits is charged to pension expense as services are rendered. Manitoba Hydro does not carry a pension asset or obligation on its consolidated financial statements for the MHI defined contribution plan.

The following table presents information pertaining to the MH Pension Fund, the EHBP and the Centra curtailed pension plans:

	MH Pension Fund		Enhanced Hydro Benefit Plan		Centra curtailed plans		Total	
	2014	2013	2014	2013	2014	2013	2014	2013
	millions of dollars							
Plan assets at fair value								
Balance at beginning of year	792	758	14	11	97	84	903	853
Actual return on plan assets	108	52	1	1	13	6	122	59
Employer contributions	30	26	2	2	10	12	42	40
Benefit payments and refunds	(47)	(44)	-	-	(5)	(5)	(52)	(49)
	883	792	17	14	115	97	1 015	903
Accrued benefit obligation								
Balance at beginning of year	1 232	1 012	20	11	113	98	1 365	1 121
Interest on obligation	52	53	1	1	5	5	58	59
Current service cost	45	35	2	2	-	-	47	37
Benefit payments and refunds	(47)	(45)	-	-	(5)	(5)	(52)	(50)
Actuarial (gains) losses	(17)	177	(1)	6	(2)	15	(20)	198
	1 265	1 232	22	20	111	113	1 398	1 365
Surplus (deficit) at end of year	(382)	(440)	(5)	(6)	4	(16)	(383)	(462)
Unamortized past service costs	-	-	-	-	-	1	-	1
Unamortized transitional balance	-	(1)	-	-	-	-	-	(1)
Unamortized net actuarial loss	424	521	4	6	45	57	473	584
Accrued benefit asset (obligation)	42	80	(1)	-	49	42	90	122

Pension assets are valued at market rates and are invested as follows:

	MH Pension Fund fair value		Centra curtailed pension plans fair value	
	2014	2013	2014	2013
	millions of dollars			
Equities	578	492	75	63
Bonds and debentures	174	185	23	23
Real estate	87	89	11	8
Infrastructure	24	22	3	3
Short-term investments	20	4	3	-
	883	792	115	97

Manitoba Hydro has $18 million (2013 - $14 million) on deposit with the CSSB for the EHBP. Manitoba Hydro does not have a separate portfolio of assets for the EHBP. The investment income earned on the EHBP funds is based on the market value rate of return that is earned by the CSSF. For the year ended December 31, 2013, the CSSF earned a rate of return of 14.7% (2013 – 10.2%) on fund assets.

The return on pension fund assets for the MH Pension Fund was 13.8% (2013 – 7.5%). The return for the Centra curtailed plan fund assets was 13.8% (2013 – 7.3%). The weighted average term to maturity on fixed income investments is 9.3 years (2013 – 8.9 years).

The most recent actuarial valuations for the corporation's obligations under the CSSB and Centra curtailed pension plans were performed with respect to the liabilities outstanding as at December 31, 2013. These valuations incorporated management's best estimate assumptions and took into consideration the long-term nature of the pension plans. The next actuarial valuations for all plans, including the EHBP will occur in December 2014. The Centra curtailed pension plans are also subject to a solvency valuation for funding purposes with the latest valuation taking place as at December 31, 2013.

The significant actuarial assumptions adopted in measuring the corporation's pension and other employee benefit obligations are as follows:

	2014	2013
Discount rate - pensions	4.50%	4.25%
Discount rate - other benefits	4.50%	4.25%
Expected long-term rate of return on plan assets	7.0%	7.0%
Rate of compensation increase, including merit and promotions	1.5 - 2.0%	1.5 - 2.0%
Expected average remaining service life of employees - MH Pensions	13 years	14 years
Expected average remaining service life of employees - Centra Pensions	10 years	10 years
Long-term inflation rate	2.0%	2.0%

The corporation's pension expense related to each of the pension benefit plans is as follows:

	CSSB Plan		Enhanced Hydro Benefit Plan		Centra curtailed pension plans	
	2014	2013	2014	2013	2014	2013
			millions of dollars			
Current service cost	45	35	2	2	-	-
Administrative fees	3	2	-	-	-	-
Canada Pension Plan	16	15	-	-	-	-
Interest on obligation	52	53	1	1	5	5
Expected return on plan assets	(59)	(58)	(1)	(1)	(7)	(7)
Amortization of net experience loss	28	13	-	-	4	2
Amortization of transitional gain	(1)	(1)	-	-	-	-
	84	59	2	2	2	-

Pension expense for the former Winnipeg Hydro employees is equal to employer contributions to the WCEBP in addition to employer remittances to the Canada Pension Plan. Total contributions to the WCEBP during the year amounted to $1 million (2013 - $1 million) and reflect an employer contribution rate approximating 4.3% of pensionable earnings to January 1, 2014 and 4.8% of pensionable earnings thereafter. Pension expense for MHUS and MHI is equal to the employer contributions and is expensed during the year. The amounts are not material.

Manitoba Hydro also provides some non-pension employee future benefits including banked incidental and vacation days, long-term disability, retiree health spending, sick leave vesting and severance.

The following table presents information concerning other employee future benefits:

	2014	2013
	millions of dollars	
Accrued benefit liability		
Balance at beginning of year	201	173
Interest on obligation	4	9
Current service cost	20	23
Benefit payments	(17)	(17)
Actuarial (gain) loss	(5)	13
	203	201
Unamortized past service costs	(6)	(7)
Unamortized transitional obligation	(2)	(3)
Unamortized net actuarial loss	(7)	(17)
Accrued benefit liability	188	174

NOTE 22 COMMITMENTS AND CONTINGENCIES

Manitoba Hydro has energy purchase commitments of $1 571 million (2013 - $1 592 million) that relate to future purchases of wind, natural gas (including transportation and storage contracts), coal and electricity. Commitments are primarily for wind, which expire in 2038, and natural gas purchases, which expire in 2020. In addition, other outstanding commitments principally for construction, are approximately $2 676 million (2013 - $1 592 million).

The corporation will incur future costs associated with the assessment and remediation of contaminated lands and facilities and for the phase-out and destruction of polychlorinated biphenyl contaminated mineral oil from electrical equipment. Although these costs cannot be reasonably determined at this time (except for items already recognized as asset retirement obligations), a contingent liability exists.

Due to the size, complexity and nature of Manitoba Hydro's operations, various legal and operational matters are pending. It is not possible at this time to predict with any certainty the outcome of these matters. Management believes that any settlements related to these matters will not have an adverse effect on Manitoba Hydro's consolidated financial position or results of operations.

Manitoba Hydro provides guarantees to counterparties as part of its use of natural gas derivative commodity contracts. Guarantees issued at March 31, 2014 totaled $311 million (2013 - $289 million) and do not have specific maturity dates. Letters of credit in the amount of $7 million (2013 - $6 million) have been issued for energy related transactions with maturities until 2015.

NOTE 23 MITIGATION

Manitoba Hydro's mitigation program addresses past, present and ongoing adverse effects of historical hydro-electric development. The mitigation program, established in the late 1970s to address project impacts through alleviation of adverse effects, remedial works, offsetting programs, and residual monetary compensation, grew out of the experience of planning and development of the Lake Winnipeg Regulation and Churchill River Diversion Projects. The Northern Flood Agreement, signed December 16, 1977, created a process that addressed ongoing mitigation and compensation for adverse effects of hydro-electric development in five signatory First Nation communities (Nelson House, Split Lake, York Landing, Norway House, and Cross Lake). The mitigation program continues to address impacts arising from past hydro-electric developments, particularly for Aboriginal people residing or engaged in resource harvesting in the project areas, and it is essential for operating and future development purposes.

Expenditures recorded or settlements reached to mitigate the impacts of all projects amounted to $17 million during the year (2013 - $21 million). In recognition of future anticipated mitigation payments, the corporation has recorded a liability of $229 million (2013 - $235 million). To March 31, 2014, $1 001 million (2013 - $984 million) has been recorded to mitigate and compensate for all project-related impacts. These expenditures are included in the costs of the related projects and amortized over the respective remaining lives. There are other mitigation issues, the outcomes of which are not determinable at this time.

Included in mitigation payments or liabilities are obligations assumed on behalf of the Province of Manitoba with respect to certain northern development projects. The corporation has assumed obligations totaling

$146 million for which water power rental charges were fixed until March 31, 2001. The obligations outstanding at March 31, 2014 amounted to $11 million (2013 - $11 million).

NOTE 24 AFFORDABLE ENERGY FUND

In accordance with the provisions of the Winter Heating Cost Control Act, Manitoba Hydro established an Affordable Energy Fund (the Fund) in the initial amount of $35 million for the purpose of providing support for programs and services that:

(a) encourage energy efficiency and conservation;
(b) encourage the use of alternative energy sources, including earth energy; and
(c) facilitate research and development of alternative energy services and innovative energy technologies.

For accounting purposes, the Fund is classified as other long-term assets (Note 14) with an offsetting balance in other long-term liabilities (Note 17). Expenditures of $4 million (2013 - $5 million) during the year were charged to operations with the asset and liability accounts reduced accordingly. As at March 31, 2014, the balance remaining in the Fund amounted to $11 million (2013 - $15 million).

NOTE 25 NON-CONTROLLING INTEREST

Manitoba Hydro has entered into a partnership agreement with Taskinigahp Power Corporation (TPC) to carry on the business of developing, owning and operating the Wuskwatim Generating Station. TPC is owned beneficially by Nisichawayasihk Cree Nation (NCN). The generating station and associated transmission was placed into service during the 2012-13 year.

The 33% ownership interest of TPC in the WPLP of $73 million (2013 - $95 million) is represented as a non-controlling interest within the equity section of the consolidated balance sheet. TPC's portion of the net loss of the WPLP during 2013-14 is $22 million (2013 – $13 million) and is recorded as non-controlling interest in the consolidated statement of income.

In accordance with the partnership agreements, Manitoba Hydro provides debt financing to TPC. As at March 31, 2014, Manitoba Hydro has provided advances to TPC of $92 million (2013 - $91 million). The advances plus interest are repayable by TPC through distributions from the WPLP.

NOTE 26 SEGMENTED INFORMATION

The corporation operates primarily in two business segments: electricity and gas. Each segment has its own particular economic characteristics and differs in nature, production processes and technology. The electricity segment encompasses the generation, transmission and distribution of electricity as well as subsidiaries providing related energy services. The gas segment represents natural gas supply and distribution activities through the operations of Centra. The corporate segment represents the costs to acquire Centra and to integrate its operations into those of Manitoba Hydro. These costs are allocated to gas and electricity segments in accordance with the synergies and benefits derived by each of these segments as a result of the acquisition.

The following table contains information related to the operating results, assets, liabilities, contributions in aid of construction and retained earnings by segment:

	Electricity		Gas		Corporate		Total	
	2014	2013	2014	2013	2014	2013	2014	2013
				millions of dollars

The Manitoba Hydro-Electric Board

QUARTERLY REPORT

for the three months ended June 30, 2014

Comments by

THE CHAIR OF THE BOARD

and by

THE PRESIDENT AND CHIEF EXECUTIVE OFFICER

FINANCIAL OVERVIEW

Manitoba Hydro's consolidated net income from electricity and natural gas operations was $7 million for the first three months of the 2014-15 fiscal year compared to a net loss of $5 million for the same period last year. The improved financial performance was primarily attributable to increased domestic sales revenues due to an increase in electricity rates and lower expenses.

Consolidated net income was comprised of a $14 million profit in the electricity sector and a $7 million loss in the natural gas sector. The loss in the natural gas sector is the result of seasonal variations in the demand for natural gas and is expected to be recouped over the winter heating season.

Based on the continuation of current water flow and export market conditions, Manitoba Hydro is forecasting that financial results will improve over the balance of the fiscal year and net income should exceed $60 million by March 31, 2015.

Electricity Operations

Revenues from electricity sales within Manitoba totaled $329 million for the three-month period, which was $7 million or 2% higher than same period last year. The increase in domestic revenue was attributable to electricity rate increases. Extraprovincial revenues of $111 million were $3 million or 3% lower than the same period last year reflecting lower sales volumes as a result of a U.S. transmission line outage, partially offset by favourable foreign exchange rates on U.S. sales. Energy sold in the export market was 2.9 billion kilowatt-hours compared to 3.1 billion kilowatt-hours sold in the same period last year.

Expenses attributable to electricity operations totaled $432 million for the three-month period, a decrease of $7 million or 2% lower than the same period last year. The decrease was the net result of a $3 million reduction in operating and administrative costs, a $3 million decrease in other expenses, a $2 million decrease in finance expense, a $1 million decrease in water rentals and assessments, a $1 million decrease in fuel and power purchased costs, partially offset by a $1 million increase in depreciation and amortization expense and a $1 million increase in capital and other taxes.

The net loss attributable to non-controlling interest represents Taskinigahp Power Corporation's 33% share of the Wuskwatim Power Limited Partnership's operating results for the first three months of the 2014-15 fiscal year.

Capital expenditures for the three-month period amounted to $379 million compared to $277 million for the same period last year. Expenditures during the current period included $136 million related to future Keeyask and Conawapa generation, $55 million for Bipole III projects, $52 million for Pointe du Bois projects, $11 million for Riel Station, and $6 million for demand-side management programs. The remaining capital expenditures were incurred for ongoing system additions and modifications necessary to meet the electrical service requirements of customers throughout the province.

Natural Gas Operations

In the natural gas sector, a net loss of $7 million was incurred for the three-month period, which is the same as the comparable period last year. Revenue, net of cost of gas sold, was $29 million, which is identical to the same period last year. Delivered gas volumes were 379 million cubic metres compared to 400 million cubic metres in the prior period.

Expenses attributable to natural gas operations amounted to $36 million compared, which is the same as the comparable period last year.

Capital expenditures in the natural gas sector were $8 million for the current three-month period compared to $10 million for the same period last year. Capital expenditures included $6 million related to system improvements and other expenditures necessary to meet the natural gas service requirements of customers throughout the province and $2 million related to demand-side management programs.

Keeyask Generation Project Approved

In May 2014 the Minister of Conversation and Water Stewardship released the Manitoba Clean Environment Commission's (CEC) report on the Keeyask Generation Project, which recommended the project be issued a license under the Manitoba Environment Act. The CEC report made a number of licensing and non-licensing recommendations for the construction and operation of the project.

The Province of Manitoba issued an Environment Act License for Keeyask and released the Public Utilities Board Panel report on the Needs For and Alternatives To (NFAT) review of Manitoba Hydro's Preferred Development Plan on July 2, 2014. The NFAT review panel recommended proceeding with immediate construction of Keeyask to meet domestic and export requirements as well as a new transmission interconnection to the United States, which will enhance export capability, drought support and reliability.

On July 5, 2014 the Province approved an Interim Water Power Act License for Keeyask. The Department of Fisheries and Oceans granted Fisheries Act Authorization on July 15, 2014. Following receipt of all required approvals, construction began on the Keeyask Generating Station on July 16, 2014.

The $6.5 billion, 695-megawatt Keeyask Generating station is being developed by Manitoba Hydro in partnership with four Manitoba First Nations — Tataskweyak Cree Nation, War Lake First Nation, Fox Lake First Nation and York Factory First Nation. The generating station will be located on the Nelson River approximately 30 kilometres west of Gillam, within the Split Lake Resource Management Area. The first generator unit in-service date is targeted for 2019 with all units being commissioned by 2020.

Electricity Rate Increase

Electricity rates for all customer classes increased by approximately 2.75% effective May 1, 2014. The Public Utilities Board directed that 2.0% of the 2.75% increase be included in general revenues and that 0.75% of the increase be used to mitigate rate increases when Bipole III comes into service.

The rate increase was necessary to provide sufficient revenues for the corporation to meet its ongoing cost of operations and support ongoing reliability of electricity service. Even with the rate increase, electricity customers in Manitoba continue to benefit from one of the lowest electricity rate structures in North America.

Natural Gas Rate Increase

In accordance with Manitoba Hydro's methodology to change natural gas rates every quarter depending on the price of gas purchased from Alberta, rates for residential customers increased on May 1, 2014 by 4.6% or approximately $38 per year. Rate increases for larger volume customers ranged from 5.3% to 9.4% depending on the customer class and consumption levels.

The Manitoba Hydro-Electric Board

QUARTERLY REPORT

for the six months ended September 30, 2014

Comments by

THE CHAIR OF THE BOARD

and by

THE PRESIDENT AND CHIEF EXECUTIVE OFFICER

FINANCIAL OVERVIEW

Manitoba Hydro incurred a net loss on consolidated electricity and natural gas operations of $6 million for the first six months of the 2014-15 fiscal year compared to a net loss of $2 million for the same period last year. The increase in net loss was primarily attributable to higher financing expenses partially offset by increased revenues from domestic electricity sales.

The consolidated net loss was comprised of a $22 million loss in the natural gas sector and a $16 million profit in the electricity sector. The loss in the natural gas sector is the result of seasonal variations in the demand for natural gas and is expected to be recouped over the winter heating season.

Based on the continuation of current water flow and export market conditions and assuming normal winter weather, Manitoba Hydro is forecasting that financial results will improve over the balance of the fiscal year and net income should exceed $100 million by March 31, 2015.

Electricity Operations

Revenues from electricity sales within Manitoba totaled $612 million for the six-month period, which was $23 million or 4% higher than same period last year. The increase in domestic revenue was primarily attributable to electricity rate increases and an increase in customers. Extraprovincial revenues of $241 million were $1 million lower than the same period last year reflecting lower sales volumes as a result of a U.S. transmission line outage, mainly offset by favourable foreign exchange rates on U.S. sales. Energy sold in the export market was 6.6 billion kilowatt-hours compared to 7.1 billion kilowatt-hours sold in the same period last year.

Expenses attributable to electricity operations totaled $879 million for the six-month period, an increase of $23 million or 3% higher than the same period last year. The increase was the result of a $29 million increase in finance expense, a $5 million increase in depreciation and amortization expense, a $2 million increase in capital and other taxes and a $1 million increase in fuel and power purchased costs, partially offset by a $10 million decrease in operating and administrative expenses, a $3 million decrease in other expenses and a $1 million decrease in water rental and assessments. Finance expense increased primarily as a result of realized foreign exchange gains on U.S. debt and gains on the sale of U.S. sinking fund investments that were recorded in the previous fiscal year. Depreciation and amortization expense increased primarily as a result of the Riel 230-kV station and the Pointe du Bois spillway coming into service in the current year. Operating and administrative expenses decreased due to a greater focus on capital requirements relating to new and existing infrastructure.

The net loss attributable to non-controlling interest represents Taskinigahp Power Corporation's 33% share of the Wuskwatim Power Limited Partnership's operating results for the first six months of the 2014-15 fiscal year.

Capital expenditures for the six-month period amounted to $943 million compared to $634 million for the same period last year. Expenditures during the current period included $429 million related to future Keeyask generation, $115 million for Bipole III projects, $89 million for the Pointe du Bois projects, $23 million for future Conawapa generation and $20 million for the Riel Station. The remaining capital expenditures were incurred for ongoing system additions and modifications necessary to meet the electrical service requirements of customers throughout the province. The Corporation also incurred $13 million for electric demand-side management programs.

Natural Gas Operations

In the natural gas sector, a net loss of $22 million was incurred for the six-month period, compared to the net loss of $21 million in the same period last year. Revenue, net of cost of gas sold, was $50 million which is $1 million higher than the same period last year. The increase in net revenues was primarily related to a distribution rate increase implemented in the summer of 2013. Delivered gas volumes were 596 million cubic metres compared to 643 million cubic metres in the prior period.

Expenses attributable to natural gas operations amounted to $72 million as compared to $70 million for the same period last year. The increase was the result of a $1 million increase in operating and administrative expenses and a $1 million increase in depreciation and amortization expense.

Capital expenditures in the natural gas sector were $16 million for the current six-month period compared to $17 million for the same period last year. Capital expenditures are related to system improvements and other expenditures necessary to meet the natural gas service requirements of customers throughout the province. The Corporation also incurred $4 million for gas demand-side management programs.

Construction Starts on the Keeyask Generating Station

Upon receiving all necessary approvals, construction on the Keeyask Generating Station commenced as scheduled on July 16, 2014. The general civil contract, the largest contract on the Keeyask project, was awarded to BBE Hydro Constructors Limited Partnership (BBE) on March 10, 2014, for a value of $1.4 billion. BBE is a limited partnership between Bechtel Canada Co., Barnard Construction of Canada Ltd. and EllisDon Civil Ltd. BBE has begun to construct river management structures including the quarry cofferdam, north channel rock groin, north channel stage 1 cofferdam and the first portion of the powerhouse cofferdam in preparation for river diversion which will allow for construction of the generating station's principle structures.

The first phase of the Keeyask main camp is nearing completion and staff have begun to occupy some of the camp's 588 rooms. Over the next 18 months, the camp will be expanded to house approximately 2,000 workers which will be required for peak construction of the Keeyask Generating Station.

The $6.5 billion, 695-megawatt Keeyask Generating Station is being developed by Manitoba Hydro in partnership with four Manitoba First Nations — Tataskweyak Cree Nation, War Lake First Nation, Fox Lake First Nation and York Factory First Nation. The generating station will be located on the Nelson River approximately 30 kilometres west of Gillam, within the Split Lake Resource Management Area. The first generator unit in-service date is targeted for 2019 with all units being commissioned by 2020.

Supplier Selected for Largest Bipole III Reliability Project Contract

Manitoba Hydro has selected the supplier for the largest contract associated with the Bipole III reliability project. The consortium of Siemens Canada and Mortenson Canada was chosen to design, supply and install the High Voltage Direct Current (HVDC) equipment and buildings required for the project's two convertor stations which is valued at approximately $800 million. The signing of the contract is expected to take place in early October. With the majority of the contract costs now committed, the budget for the Bipole III project is $4.6 billion as compared to the preliminary estimate of $3.3 billion prepared in 2011.

The Bipole III project is the best option for enhancing the reliability of Manitoba Hydro's transmission system and reducing the dependencies on the Dorsey Converter Station and the existing HVDC Interlake corridor. It includes: a 1 384-kilometre, 500 kV direct current transmission line; the Keewatinohk Converter Station and the Riel Converter Station. These facilities will back-up the Bipole I and II HVDC transmission systems, which share a common right-of-way corridor, and the Dorsey Converter Station. Currently over 70 percent of all electricity generated by Manitoba Hydro travels south over two, side-by-side transmission lines, Bipoles I and II and being in such close proximity to each other make the lines susceptible to being impacted by a single weather incident or forest fire event, as happened in September 1996. Bipole III and other converter stations provide an alternate path for electricity to reach customers should such an event re-occur. The project also provides the additional capacity to bring electricity from the new hydro projects in the north to southern Manitoba and offers employment, training and other economic benefits for Manitoba.

Natural Gas Rate Changes

In accordance with Manitoba Hydro's methodology to change natural gas rates every quarter depending on the price of gas purchased from Alberta, rates for residential customers decreased on August 1, 2014 by 0.8% or approximately $7 per year. Rate changes for larger volume customers ranged from a decrease of 2.0% to an increase of 3.8% depending on the customer class and consumption levels.

INTERNATIONAL FINANCIAL REPORTING STANDARDS (IFRS)

STATUS UPDATE REPORT as at October 31, 2014

Manitoba Hydro

TABLE OF CONTENTS

Executive Summary

Manitoba Hydro (MH) will be required to prepare financial statements in accordance with International Financial Reporting Standards (IFRS) effective for its 2015/16 fiscal year with comparative information presented for 2014/15. The 2015/16 transition year represents an additional one year deferral to MH's previous deferred transition date of 2014/15 and is the result of a February 2013 decision by the Accounting Standards Board of Canada (AcSB) to extend the option for rate-regulated entities to transition to IFRS to 2015. The AcSB provided for an additional deferral of transition in anticipation of an approval by the International Accounting Standards Board (IASB) of an interim standard permitting rate-regulated entities to continue to recognize rate regulated accounts for financial reporting upon transition to IFRS. On January 30, 2014, the IASB issued the interim standard IFRS 14 *Regulatory Deferral Accounts.* MH will adopt the interim standard upon transition to IFRS and will continue to recognize rate-regulated accounts for its financial reporting.

Overall, the transition to IFRS is not expected to have a significant impact on customer rates. Increases to operating and administrative expenses due to reductions in overhead eligible for capitalization will be substantially offset in the future by corresponding reductions in depreciation and amortization expense. The net impact of the transition to IFRS for 2015/16 is expected to be a decrease to net income of approximately $20 million. In addition to the net income impacts, retrospective application for changes in accounting resulting from differences from existing GAAP is required. For MH, the transition to IFRS will result in an initial adjustment to retained earnings of approximately $54 million and an adjustment to Accumulated Other Comprehensive Income (AOCI) of $445 million.

The following table identifies the consolidated transitional adjustments and projected 2015/16 net income impact of MH's transition to IFRS *(In millions of dollars):*

	IFRS IMPACTS INCREASE / (DECREASE)		
	Retained Earnings April 1, 2015	**AOCI**	**Net Income 2015/16**
Administrative Overhead	(56)		(57)*
Pension & Employee Benefits	(24)	(445)	3
Meter Compliance, Exchange and Sampling			5
Capital Taxes	-		3
Removal of Asset Retirement Costs from Depreciation	62		64
Change to Equal Life Group Method of Depreciation	(36)		(38)
Total	**(54)**	**(445)**	**(20)**

*net of reductions in amortization

The topics in the following table have been identified as having the highest potential impact to MH upon its transition to IFRS:

Topic	Issue
Rate-Regulated Accounting	- Prior to December 2013, IFRS did not include a standard that recognized rate-regulated accounting. In the absence of a such a standard, MH would be required to charge approximately $335 million in rate regulated accounts to retained earnings upon transition to IFRS and future expenditures on these items would be required to be expensed as incurred. - In its May 2012 meeting, the IASB supported giving priority to developing a standards-level project and detailed discussion paper for rate-regulated activities. This decision was based on the feedback the IASB received on its June 2011 Agenda Consultation. - As a result of the developments at the IASB, in September 2012 the AcSB extended the optional transitional deferral for rate-regulated entities by an additional one year to January 1, 2014. - In its December 2012 meeting, the IASB decided that an Exposure Draft for an Interim Standard should be developed as a temporary solution until the IASB completes its comprehensive project on rate-regulated activities. The interim standard would permit "grandfathering" of existing recognition and measurement policies for rate-regulated accounts and would require these accounts to be presented separately in the financial statements. - Supported by the actions of the IASB, in February 2013, the AcSB extended the optional transition date deferral to IFRS for rate-regulated entities by an additional one year to January 1, 2015. - In April 2013, The IASB issued the Exposure Draft "Regulatory Deferral Accounts" with comments to be received by September 4, 2013. The exposure Draft applied to first–time adopters of IFRS only, permitted grandfathering of existing rate-regulated accounting practices, and required regulatory accounts to be presented separately in the financial statements. - On January 30, 2014, the IASB issued an Interim IFRS (IFRS 14 *Regulatory Deferral Accounts*) for rate-regulated activities effective January 1, 2016 with earlier adoption permitted. Manitoba Hydro will early adopt the interim standard effective April 1, 2015 and will continue to recognize rate-regulated accounts upon its transition to IFRS.

Topic	Issue
Intangible Assets	- GAAP converged with IFRS effective for MH's 2009/10 financial statements. The impact of this change on prior years was a cumulative reduction to retained earnings of $37 million related to the write-off of ineligible research and promotional related expenditures.
Property, Plant & Equipment (PP&E)	- The IASB has approved an exemption for rate-regulated entities to carry forward existing PP&E balances as of the transition date to IFRS. - MH has established new components as part of their review for compliance with IFRS and has completed a depreciation study based on these new components. - MH will change from the Average Service Life method of calculating depreciation to the Equal Life Group approach so as to ensure that each asset within a pool is fully depreciated upon its retirement. - MH will remove the provision for asset removal costs (negative salvage) from depreciation rates as this is not an IFRS eligible cost for self-constructed assets. - The impacts in 2015/16 to net income from the change to the Equal Life Group method and the elimination of the provision for asset removal costs will result in an annual decrease in depreciation of $26 million.
Capitalization of Overhead Costs	- IFRS specifically states that administration and other general overhead costs are not eligible for capitalization. - Through to 2012/13, MH adjustments with respect to discontinuing the capitalization of overhead costs total $62 million. This amount grows to $65 million by 2014/15 including inflation. - MH will discontinue the capitalization of an additional $58 million annually of general overhead costs upon transition to IFRS in 2015/16. - The $58 million is comprised primarily of expenditures for training, services and administration and managerial related charges.

Topic	Issue
Pension Costs	- IFRS does not permit the deferral of experience gains and losses for calculating expected fund returns and does not permit the use of expected asset returns in determining the discount rate used to measure the pension obligation. - IAS 19 has been amended (effective January 1, 2013) such that all actuarial gains and losses are to be recognized in Other Comprehensive Income. - MH expects to reclassify unrecognized actuarial experience losses of approximately $445 million to Accumulated Other Comprehensive Income upon adoption of IFRS.
Employee Benefits	- IFRS requires the estimated obligation for the unvested portion of accumulating benefits to be recognized over the period of service. - IFRS also requires past service benefit charges to be expensed as incurred. - Upon transition, MH expects to recognize approximately $15 million in increases to obligations with corresponding adjustments to retained earnings for unvested sick leave and severance benefits. - In addition, MH expects to charge approximately $9 million to retained earnings for unamortized past service balances for Retirement Health Spending Plan amendments.

1.0 Introduction

In February 2008, The AcSB declared January 1, 2011 as the date for Canadian publicly accountable enterprises to commence using International Financial Reporting Standards (IFRS) as a replacement for Canadian Generally Accepted Accounting Principles (GAAP). The Public Sector Accounting Board (PSAB) standards requires that public-sector enterprises with self-sustaining commercial-type operations (government business enterprises) such as Manitoba Hydro (MH) follow IFRS. Since 2008, the ACSB has approved several optional one-year deferrals of the transition to IFRS for Canadian entities subject to rate-regulation.

Although IFRS and GAAP are both principles-based, there are a number of differences between IFRS and GAAP that will result in changes in the timing of when costs are recognized by MH. Prior to January 2014, the most significant difference for entities subject to rate-regulation is that IFRS did not include a standard that recognized rate-regulated activities.

In recognition of the importance of this issue to North American utilities, the IASB started deliberations on this topic back in 2008 and since that time has started a project on rate regulated activities, issued an exposure draft in 2009, discontinued the project in 2010, restarted the project in 2012, issued an exposure draft in 2013 and issued an interim standard permitting the recognition of rate-regulated accounts in January 2014 (effective January 1, 2016 with early adoption permitted). Given the many years of uncertainty as to whether or not rate-regulated accounting would be permitted by the IASB, the AcSB issued multiple optional one-year deferrals of the transition to IFRS for Canadian rate-regulated entities. The following table summarizes the optional one-year deferrals of transition to IFRS as issued by the AcSB:

AcSB Decision Date	Revised IFRS Transition Date	Effective Date for Manitoba Hydro
September 2010	January 1, 2012	April 1, 2012
March 2012	January 1, 2013	April 1, 2013
September 2012	January 1, 2014	April 1, 2014
February 2013	January 1, 2015	April 1, 2015

Manitoba Hydro adopted each of the optional one-year deferrals issued by the AcSB and will be transitioning to IFRS effective April 1, 2015 for its 2015/16 fiscal year with comparative information for the 2014/15 fiscal year. Upon transition, MH will early adopt the IFRS interim standard IFRS 14 *Regulatory Deferral Accounts* and will continue to recognize regulatory deferral accounts in its financial statements.

MH has completed its assessment of the major differences upon transition to IFRS and has identified adjustments to retained earnings and ongoing differences in the timing of the recognition of certain transactions. The impacts of the transition affect primarily the accounting for property, plant and equipment (PP&E), general and administrative overhead capitalized and pension and benefits.

The overall impacts from conversion to IFRS can be summarized in the following three categories:

a) Transitional Adjustments

MH's transition to IFRS will result in adjustments to opening Retained Earnings and Accumulated Other Comprehensive Income (AOCI) as IFRS generally requires retrospective application. Such adjustments are somewhat less onerous due to an exemption that allows rate-regulated entities to carry-forward the historical cost of its PP&E and the interim standard that permits first-time adopters of IFRS to maintain rate-regulated accounts upon transition to IFRS.

b) Ongoing differences

MH has identified ongoing differences in the timing of recognition of certain transactions under IFRS. Increases in the amounts reported as annual operating and administrative expense resulting from annual overhead related expenditures that no longer qualify for capitalization or deferral are substantially offset over time by reductions in annual depreciation and amortization charges.

The following table identifies the consolidated transitional adjustments and projected 2015/16 net income impact of the transition to IFRS and the related accounting changes:

	IFRS IMPACTS INCREASE / (DECREASE)		
	Retained Earnings April 1, 2015	**AOCI**	**Net Income 2015/16**
Administrative Overhead	(56)		(57)*
Pension & Employee Benefits	(24)	(445)	3
Meter Compliance, Exchange and Sampling			5
Capital Taxes			3
Removal of Asset Retirement Costs from Depreciation	62		64
Change to Equal Life Group Method of Depreciation	(36)		(38)
Total	**(54)**	**(445)**	**(20)**

*net of reductions in amortization

2.0 Overview of IFRS Conversion Project

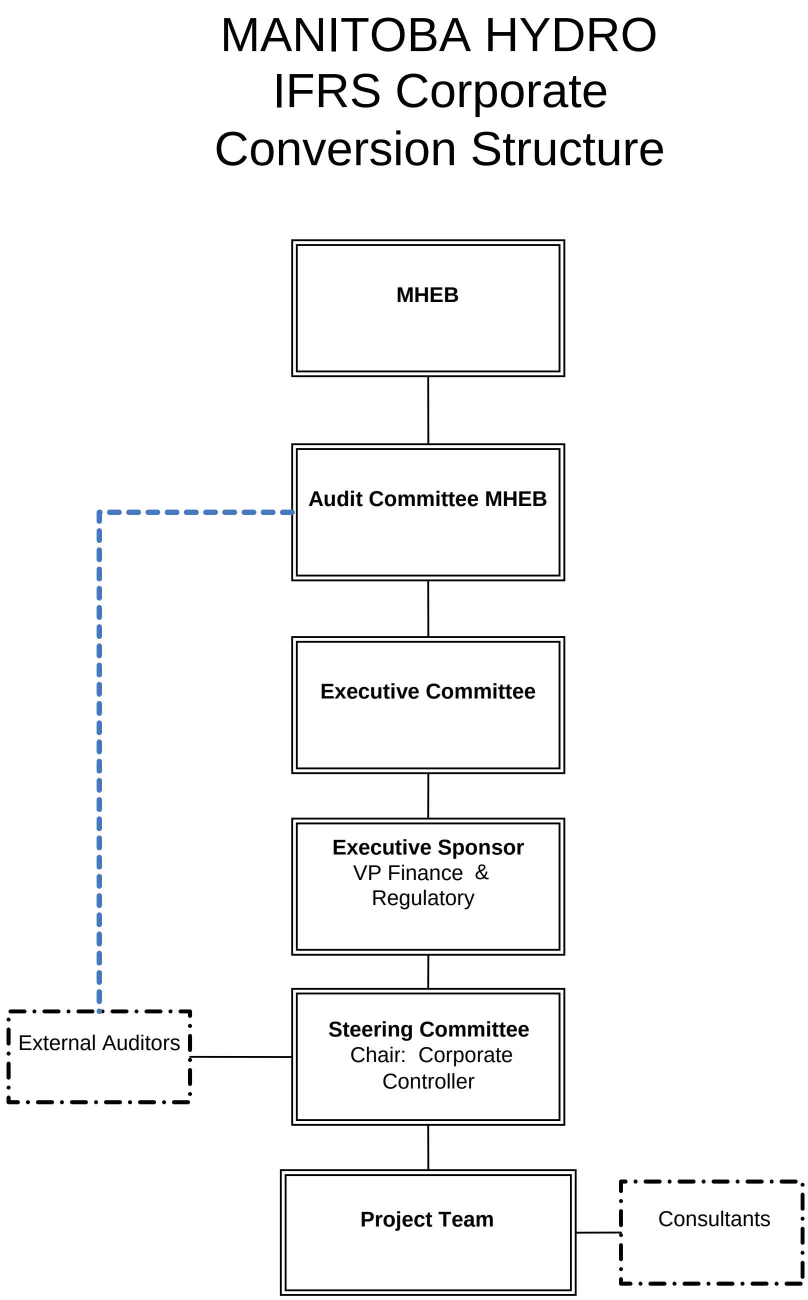
The following sections provide an overview of the MH IFRS conversion project structure, the project phases and the roles of the external consultants and auditors engaged to assist MH with the adoption of IFRS.

2.1 Project Structure

In 2008, MH formed a project team to manage the overall conversion to IFRS. Project team members work closely with a number of other employees throughout the Corporation to analyze the technical accounting issues and possible impacts of available options. The time commitment for these employees varies according to the complexity of the topics being considered.

In addition to the project team, a Steering Committee was established comprised of senior management representing each business unit, as well as other senior MH finance staff and a representative from MH's external auditor, Ernst & Young. The Executive Sponsor of the IFRS conversion project is the Vice-President Finance & Regulatory who has responsibility for the project and the communication of project results through the Executive Committee to the Audit Committee and the Manitoba Hydro-Electric Board (MHEB).

MH's formal project structure is summarized as follows:



2.2 Project Phases

The IFRS conversion project was divided into four phases with the following primary objectives:

1) Initial Assessment & Project Mobilization

- Establish project structure and mobilize project team;
- Develop initial project plan; and
- Identify potential gap differences between MH's policies and IFRS.

2) Detailed Design

- Prepare detailed gap analysis between MH's policies and IFRS;
- Assessment of the impact on key systems and related processes; and
- Update conversion plan.

3) Solution Development

- Develop comprehensive and detailed plans to convert systems and processes;
- Provide pro-forma financial statements and policies; and
- Develop detailed training programs.

4) Implementation

- Convert systems and processes;
- Prepare related documents and perform system testing; and
- Deliver IFRS training.

2.3 External Consultants

Through its project team and structure, MH managed the IFRS conversion project internally with the assistance of its primary consultant KPMG. Specifically, to date, KPMG has assisted the MH project team with:

- Project plan development, establishing priorities and monitoring progress;
- Detailed gap analysis of accounting and disclosure differences;
- Identifying accounting and system/process issues and raising awareness through educational sessions with management and staff;
- Application and interpretation of IFRS towards accounting policy and financial statement development;
- Assessment of information technology system requirements and possible solutions; and
- Detailed training and knowledge transfer.

There are also a number of technical areas involved in the IFRS project and MH has engaged Gannett Fleming Inc. and Ellement & Ellement to assist in the following areas:

Gannett Fleming Inc.:

- Application of IFRS as it applies to PP&E;
- Development of asset groupings that comply with IFRS componentization requirements;
- Development of IFRS compliant depreciation rates and related policies and practices applicable to each asset group;
- Development of historic cost and accumulated depreciation for the new asset groups; and
- Support for the regulatory review process.

Ellement & Ellement:

- Actuarial services on employee benefit obligations; and
- Review and consultation on pension calculations.

MH is in the process of hiring a consultant to assist with the technical system changes to facilitate financial reporting requirements under both IFRS and Canadian GAAP upon transition.

2.4 External Auditors

In order to opine on MH's consolidated financial statements for the year ended March 31, 2016 under IFRS, MH’s external auditors will be required to:

- Review MH's accounting policies under IFRS standards;
- Audit MH's opening balance sheet at April 1, 2014 under IFRS, perform audit procedures on individual IFRS adjustments and the restatement of comparative periods;
- Review information system, process and internal control changes; and
- Review and comment on financial statement presentation and disclosures under IFRS.

MH's current external auditor, Ernst & Young, has provided advice and has concurred with accounting changes that have been implemented to March 31, 2014. In addition, Ernst & Young has participated in discussions on various IFRS conversion issues particularly with respect to overhead costs eligible for capitalization and pension and benefits.

3.0 Key Areas of Interest

The following topic areas were analyzed as to their impact to MH upon conversion to IFRS:

1. Rate-Regulated Accounting
2. Goodwill & Intangible Assets
3. Property, Plant & Equipment
4. Capitalization of Overhead Costs
5. Employee Pension and Benefits
6. Financial Instruments
7. Leases
8. Customer Contributions
9. IFRS 1 - Initial Adoption of IFRS

The following sections provide an overview of each of these main topic areas.

3.1 Rate-Regulated Accounting

The following sections describe rate-regulated accounting under GAAP and IFRS and describe the IASB's process towards the establishment of a comprehensive project to study the impacts of rate-regulation on financial reporting and the establishment of an interim standard for rate-regulated accounting.

3.1.1 Rate-Regulated Accounting under GAAP

MH recognizes the impact of rate-regulation by applying various accounting policies that allow for the deferral of certain costs or credits which will be recovered or refunded in future rates. This practice is commonly referred to as rate-regulated accounting. In the absence of rate-regulated accounting, these costs or credits may otherwise have been included in the determination of net income in the year incurred.

Effective January 1, 2009, GAAP was revised to remove a temporary exemption that permitted the recognition of assets and liabilities resulting from rate regulation. In the absence of specific guidance under GAAP, rate-regulated entities in Canada are permitted to reference and apply Accounting Standards Codification 980, "Regulatory Operations" (formerly FAS 71), issued by the US Financial Accounting Standards Board (FASB), which allows for the recognition of rate-regulated assets and liabilities under the following circumstances:

a) The enterprise's rates for regulated services or products are established by or subject to approval by an independent, third-party regulator;
b) The regulated rates are designed to recover the specific enterprise's costs of providing the regulated services; and
c) It is reasonable to assume that rates set at levels that will recover the enterprise's costs can be charged to and collected from customers.

Pursuant to a practice allowed by Canadian GAAP, MH has relied on this standard to maintain its current accounting treatment for rate-regulated assets and liabilities through to 2014/15.

3.1.2 Rate-regulated Accounting Under IFRS

Prior to January 30, 2014, IFRS did not include a standard that permitted the recognition of the economic effects of rate regulation. While IFRS did not preclude the recognition of regulatory assets and liabilities, it required that an asset or liability must meet the existing framework for recognition. The application of the IFRS framework in other countries did not typically result in the recognition of regulatory assets and liabilities.

The absence of specific IFRS guidance for rate-regulated accounting had been a significant concern of the Canadian utility industry since the AcSB decision to transition to IFRS. This issue was on the agenda of both the International Financial Reporting Interpretation Committee (IFRIC) and the IASB in 2008. The IASB added this project to its agenda in December 2008 because of concerns that differences of views would emerge in practice about whether it was appropriate for entities to recognize assets and liabilities arising from rate regulation and because of the ongoing requests for guidance on this issue.

The IASB issued an Exposure Draft (ED), *Rate-regulated Activities,* on July 23, 2009. The proposed standard allowed for assets and liabilities that arise from rate-regulated activities (within the scope of the ED) to be recognized under IFRS.

The responses to the ED were submitted in November 2009 and were mixed in terms of those supporting and opposing the proposed standard. MH provided commentary to the IASB on the

ED and also provided input into the Canadian Electrical Association (CEA), Canadian Gas Association and Canadian Energy Pipeline Association joint response.

The IASB met to discuss the comments received and to provide direction on the Rate-regulated Activities ED on February 17, 2010. At this meeting it was tentatively confirmed that entities subject to rate regulation should be allowed an additional exemption to IFRS to carry forward existing balances of PP&E and intangibles at transition to IFRS. No other decisions as to the future direction of the ED was reached however, as the diversity in responses to the ED made it difficult for the IASB to conclude on a future direction.

On May 6, 2010, the IASB approved an amendment to IFRS 1 (First-time Adoption of IFRS) to allow entities with rate-regulated activities to use the carrying amount of their PP&E and intangible asset balances from their previous GAAP as deemed cost upon transition to IFRS. These balances may include amounts that would not be permitted for capitalization under IAS 16 Property, Plant and Equipment, IAS 23 Borrowing Costs and IAS 38 Intangible Assets.

Due to the uncertainty of the timing of the resolution of this issue by the IASB, on September 8, 2010, the AcSB approved an optional one-year deferral for transition to IFRS for entities subject to rate regulation. The deferral was in recognition that entities with rate-regulated activities will require additional time to prepare themselves and the users of their financial statements for conversion to IFRS. As was the case with most other rate-regulated utilities in Canada, MH adopted this deferral.

On September 16, 2010, the IASB further reviewed the issue of rate-regulated accounting and concluded that members were clearly divided in terms of those supporting and those opposing the recognition of rate-regulated assets and liabilities. The IASB thus decided to discontinue the project on rate-regulated accounting on the basis that this topic would require more analysis and discussion than IASB resources would allow in consideration of other priorities.

3.1.3 IASB Agenda Consultation:

In July 2011, the IASB issued an Agenda Consultation document that requested feedback from its constituents as to its future strategic priorities and those areas of financial reporting that should be given the highest priority for improvement. The document listed the deferred projects of the IASB (including the rate-regulated accounting project) and requested suggestions for selecting new projects or removing projects to free up resources for other priorities. Comments on the IASB agenda consultation were due November 30, 2011. The CEA responded to the consultation indicating the need for the future agenda to address the impacts of rate regulation so as to reduce the extent of divergence in financial reporting emerging in the Canadian utility industry.

In March 2012, members the IASB met with the AcSB, the Big 4 accounting firms and industry representatives (including members from the CEA) to discuss the Canadian feedback from the IASB 2012 agenda consultation. One of the main issues discussed was the divergence in practice (IFRS, US GAAP and modified IFRS) emerging in the financial reporting of Canadian utilities due to a perceived lack of clarity regarding the accounting for rate-regulated activities under IFRS. It was suggested that an interim standard permitting the continued use of rate-regulated accounting in conjunction with the transition to IFRS be issued so as to reduce divergence in practice while a more comprehensive project was underway.

IASB representatives at the meeting acknowledged that this issue should be a priority and were amenable to an interim solution, but time and resources would prevent them from issuing an interim standard prior to 2015. Based on these discussions, on March 30, 2012, the AcSB announced a further extension of the optional deferral of the mandatory changeover date to IFRS for entities with qualifying rate regulated activities by an additional one-year to January 1, 2013.

In its May 2012 meeting, the IASB supported giving priority to developing a standards-level project for rate-regulated activities and in September 2012, the IASB decided to restart the project with the development of a comprehensive Discussion Paper to assess whether and how the IASB should develop an IFRS (or amend existing IFRSs) to reflect the impact of rate-regulation. In recognition that the development a comprehensive standards-level proposal will take several years, the IASB also discussed the potential for an interim IFRS for use until a comprehensive review is completed. As a result of the developments at the IASB, in September 2012 the AcSB extended the optional transitional deferral for rate-regulated entities by an additional one year to January 1, 2014.

In its December 2012 meeting, the IASB decided that an Exposure Draft for an Interim Standard should be developed as a temporary solution until the IASB completes its comprehensive project on rate-regulated activities. The interim standard would permit "grandfathering" of existing recognition and measurement policies for entities currently recognizing rate-regulated accounts and that these accounts would be required to be presented separately in the financial statements. Based on the actions of the IASB, in February 2013, the AcSB extended the optional transition date deferral to IFRS for rate-regulated entities by an additional one year to January 1, 2015.

In April 2013, The IASB issued the Exposure Draft *Regulatory Deferral Accounts* with comments to be received by September 4, 2013. The exposure Draft permitted grandfathering of existing rate-regulated accounting practices, required regulatory accounts to be presented separately in the financial statements and applied to rate-regulated entities that are first–time adopters of IFRS. MH provided comments to the IASB in support of the proposals in the exposure draft.

In its November 2013 meetings, the AcSB decided that with the issuance of an interim standard for regulatory deferral accounts by the IASB, they will not provide a further optional one year deferral of the mandatory date to transition to IFRS. As such, Canadian rate-regulated entities will be required to transition to IFRS effective January 1, 2015.

On January 30, 2014, the IASB approved the new interim standard IFRS 14, *Regulatory Deferral Accounts* which is effective January 1, 2016 with earlier adoption permitted. The key aspects of the new standard are as follows:

- An entity is permitted to apply the interim standard only if it:
    - is a first-time adopter of IFRS;
    - conducts rate-regulated activities; and
    - recognized amounts that qualify as regulatory deferral account balances in its financial statements in accordance with its previous GAAP.
- A rate-regulated entity is to continue to use its previous GAAP accounting policies, for the recognition, measurement and impairment of regulatory deferral account balances;

- The entity is to present regulatory deferral account balances as separate line items in the statement of financial position and to present movements in those account balances as a separate line item in the statement of profit or loss and other comprehensive income; and
- The entity is to provide specific disclosures to identify clearly the nature of, and risks associated with, the rate regulation that has resulted in the recognition of regulatory deferral account balances.

MH's operations fall within the scope of the new interim standard and it will early adopt the standard upon its transition to IFRS effective April 1, 2015.

3.1.4 Recent Developments

On September 17, 2014 The Discussion Paper "*Reporting the Financial Effects of Rate Regulation*" was issued and describes a type of rate regulation that contains elements of both cost recovery and incentive approaches. The Discussion Paper considers the common features of rate regulation and explores which of them, if any, creates a combination of rights and obligations that is distinguishable from rights and obligations arising from non rate-regulated activities. The Discussion Paper does not include specific accounting proposals, but rather explores several possible approaches that the IASB could consider when deciding how best to report the financial effects of a defined type of rate regulation. The deadline for comments for the Discussion Paper is January 15, 2015.

3.1.5 Rate Regulated Accounts – Summary

MH's rate-regulated assets consist of the following:

- **Power Smart Programs:** represent expenditures for the costs of the Corporation's energy conservation programs for both the electric and gas operations.
- **Site Restoration Costs:** represent expenditures on restoring MH electric (including diesel sites) and gas sites.
- **Deferred Taxes:** represent the unamortized balance of taxes paid upon the acquisition of Centra Gas by MH. Upon Centra's acquisition, Centra became a nontaxable entity which triggered this charge to MH.
- **Acquisition costs**: represent the internal and external costs associated with the acquisitions of Centra Gas and Winnipeg Hydro.

- **Regulatory costs**: represent past MH internal and external costs associated with electric and gas regulatory hearings.
- **Purchased gas variance account (PGVA)**: represents timing differences between the actual cost of gas to serve our market and the recovery of those costs through PUB approved sales rates. This account may, at any time, be in an asset or liability position.
- **DSM deferral liability**: represents the difference between actual and planned DSM spending.

MH's regulatory assets/liabilities meet the recognition criteria for regulatory deferral accounts under the interim IFRS 14 standard and as such, will continue to be recognized separately on the financial statements of MH upon transition to IFRS. The following tables summarize the actual balance sheet amounts for 2013-14 and projected income statement and balance sheet amounts for 2014-15 and 2015-16:

Table 3.1.1 Summary of Rate-Regulated Accounts

Comparative Year 2014-15

Item	Electric		Gas		Ending Balance Consolidated

3.2 Goodwill & Intangible Assets

Effective for MH's 2009/10 fiscal year, GAAP was converged with IFRS for the recognition and measurement of Goodwill & Intangible Assets (GAAP section 3064). The new standard required retrospective application for the 2008/09 fiscal year.

3.2.1 Goodwill

MH acquired two major utility operations - Centra Gas in July 1999 and Winnipeg Hydro in September 2002. As a result of these acquisitions, MH has recorded Goodwill in the amount of $108 million which has remained unchanged since March 31, 2003. In accordance with GAAP, goodwill is not amortized; it is tested for impairment on an annual basis unless all of the following criteria have been met:

a) The assets and liabilities that make up the reporting unit have not changed significantly since the most recent fair value determination;
b) The most recent fair value determination resulted in an amount that exceeded the carrying amount of the reporting unit by a substantial margin; and
c) Based on an analysis of events that have occurred and circumstances that have changed since the most recent fair value determination, the likelihood that a current

fair value determination would be less than the current carrying amount of the reporting unit is remote.

The goodwill accounting requirements under GAAP and IFRS are converged, however, GAAP uses a different impairment testing model from IFRS. IFRS generally determines an impairment loss as the excess of the carrying amount above the recoverable amount of the cash generating unit to which the goodwill is allocated, rather than the difference between carrying amount and fair value of the reporting unit's goodwill as required for GAAP.

Under IFRS and GAAP, irrespective of whether there is any indication of impairment, an entity is required to annually test goodwill acquired in a business combination for impairment. The IFRS impairment testing model is applied at the cash generating unit level as compared to the GAAP model which is applied at the reporting unit level. In addition, IFRS allows for a reversal of an impairment loss for long lived assets, but it does not permit an impairment reversal for goodwill.

MH will incorporate these changes into an annual impairment test for the goodwill resulting from the acquisition of Centra Gas and Winnipeg Hydro. MH does not expect that the application of this impairment test upon transition to IFRS will result in any impairments.

3.2.2 Transitional Requirements (IFRS 1)

IFRS requirements are applied retrospectively when an entity adopts IFRS. Under IFRS 1, however, a first-time adopter has the optional exemption to not retroactively restate any business combinations that occurred prior to the date of transition to IFRS. MH will take the exemption and not restate any past business combinations.

3.2.3 Intangible Assets

The new Canadian standard (section 3064) includes criteria for an expenditure to qualify for recognition as an intangible asset and stipulates that research related expenditures are to be expensed in the period incurred. Under GAAP and IFRS, an expenditure is recognized as an intangible asset only if it meets one of the following "identifiable" criteria:

a) Is separable (i.e., is capable of being separated or divided from the entity and sold, transferred, licensed, rented or exchanged, either individually or together with a related contract, asset or liability); or
b) Arises from contractual or other legal rights, regardless of whether those rights are transferable or separable from the entity or from other rights and obligations.

Examples of identifiable intangibles are franchise rights, patents and licenses. In addition to the "identifiable" requirement, an entity must demonstrate its ability to control and obtain the future economic benefits from the intangible asset. For internally generated intangible assets, the new section 3064 also requires the following "research" related activities to be expensed as incurred:

a) Activities aimed at obtaining new knowledge;
b) The search for, evaluation and final selection of, applications of research findings or other knowledge;
c) The search for alternatives for materials, devices, products, processes, systems or services; and
d) The formulation, design, evaluation and final selection of possible alternatives for new or improved materials, devices, products, processes, systems or services.

Activities incurred after the selection of a chosen alternative for the project are eligible for capitalization with the exception of:

- Selling, administrative and other general overhead expenditures unless this expenditure can be directly attributed to preparing the asset for use;
- Identified inefficiencies and initial operating losses incurred before the asset achieves planned performance; and
- Expenditures on training staff to operate the asset.

The following sections summarize the impact of the convergence of GAAP with IFRS for MH with respect to intangible assets.

Power Smart Programs (Demand Side Management-DSM)

MH previously recognized electric DSM program expenditures as deferred costs and natural gas DSM program expenditures as rate-regulated assets. Upon the issuance of section 3064, an assessment determined that electric DSM activities did not meet the new intangible asset recognition criteria as these activities are not capable of being separated and transferred to another entity. As a result, MH reclassified unamortized electric related DSM charges to rate-regulated assets consistent with gas related DSM charges.

The new standard 3064 and IFRS specifically identify research, selling/promotion and indirect expenditures as ineligible costs for capitalization as an intangible asset. New DSM programs typically include research activities as well as promotional activities to introduce the DSM programs. Thus, upon adoption of section 3064, MH retrospectively adjusted unamortized DSM related balances for ineligible research and promotional related balances. The cumulative retained earnings adjustment associated with the April 1, 2008 DSM balance was approximately $5 million for electric related DSM charges and $1 million for gas related DSM charges.

Planning Studies

To comply with GAAP and IFRS, MH also reviewed its planning study expenditures and separated the expenditures into two categories:

a) Next generation and transmission studies; and
b) Emerging energy studies (i.e. wind studies to identify potential sites, hybrid electric vehicles).

The studies for next generation and transmission plant meet the criteria for recognition as an asset, but because such expenditures are intended to ultimately result in the construction of a tangible plant asset, deferral as an intangible asset is not appropriate. Therefore, these expenditures will be recognized as tangible construction in progress (CWIP) assets at the point in time when there is reasonable assurance that a commitment to construction will be made. Expenditures incurred prior to this point will be expensed in the period incurred.

Planning studies for emerging energies result in the accumulation of information and /or research data that enables MH to assess the impacts of energy options on its operations. Although emerging energy studies are necessary, the information generated from such studies does not normally result in the creation of separate or identifiable intangible assets and thus, does not meet the criteria for recognition as an asset. Therefore the costs associated with emerging energy activities will be expensed in the period incurred. The cumulative retained earnings adjustment associated with the April 1, 2008 planning studies balance for ineligible charges was approximately $25 million.

Information Technology - Application Development

MH reviewed its computer system application development process and concluded that, for the most part, expenditures of this nature met the requirements for recognition as intangible assets. However, research and planning related activities involving the need for a new system (software / hardware) or the research and feasibility analysis of alternative solutions should be expensed in the period incurred. The cumulative retained earnings adjustment associated with the April 1, 2008 Application Development Projects balance for ineligible charges was approximately $5 million.

3.2.4 Presentation and isclosure

GAAP and IFRS emphasize that intangible assets are separate and identifiable stand alone assets and as such, should be presented separately on the balance sheet rather than being classified in PP&E. Upon adoption of section 3064, MH reclassified (April 1, 2008 balances, net of accumulated amortization) $103 million of Computer Software development and $37 million of Easements from Property, Plant & Equipment to a separate category titled Goodwill and Intangible Assets.

3.2.5 Summary of Impacts

The following tables summarize the actual April 1, 2008 retained earnings adjustments with respect to the retrospective application of the new standard and the impact to net income for 2009/10 amounts:

Table 3.2.1 Summary of Transitional Adjustments to Intangible Assets - Charge to April 1, 2008 Retained Earnings
(In millions of dollars)

Item	Electric	Gas	Consolidated
Demand Side Management - Research and Promotion	5	1	6
Planning Studies	25	-	25
IT Application Development - Research	4	1	5
Other	1	-	1
Decrease to Retained Earnings	**35**	**2**	**37**

Table 3.2.2 Summary of Net Income Impacts from Intangible Assets - 2009/10
(In millions of dollars)

Item	Electric	Gas	Consolidated
Demand Side Management - Research and Promotion	(1)	(1)	(2)
Planning Studies	(2)	-	(2)
IT Application Development - Research	(1)	-	(1)
Other	-	-	-
Consolidated Amortization Offsets	**5**	**-**	**5**
Net Income Impact	**1**	**(1)**	**0**

The annual impacts to net income related to the changes in the standard for intangible assets reflects offsets for reductions in amortization and will vary in the future according to the degree of annual spending for these items.

3.3 Property, Plant & Equipment (PP&E)

Amounts recognized as PP&E under IFRS can differ from current GAAP both at the time of initial transition and subsequent to the transition to IFRS.

3.3.1 Transitional Requirements (IFRS 1)

In general, IFRS requires retrospective application. There are exemptions available from this general requirement under IFRS 1. An entity may elect to measure an item of PP&E at the date of transition to IFRS at its fair value and use that fair value as its deemed cost at that date. Alternatively, entities with rate-regulated activities may use the carrying amount of their PP&E and intangible asset balances from their previous GAAP as deemed cost upon transition; subject to an impairment test as at the transition date. As a result of the IFRS exemptions, no retroactive adjustment would be required to adjust any differences in capitalized costs.

MH supports that carrying forward historical cost is the appropriate treatment for a rate-regulated entity as existing and future rates are largely based on historical costs. MH will take the exemption that a rate-regulated entity can elect to use the historical carrying value of PP&E as its deemed cost on transition to IFRS.

3.3.2 Subsequent to the Transition to IFRS

Under existing GAAP, PP&E is recorded based on actual historical costs, which represents historical capitalized costs net of accumulated depreciation. Under IFRS, a company has the option of choosing either the historical cost model or the revaluation model for recording PP&E. Under the cost model, PP&E is carried at its net book value – i.e. historical cost less accumulated depreciation. Under the revaluation model, a class of PP&E can be carried at fair value less any subsequent accumulated depreciation. Determining the appropriate method of measuring fair value may require the use of professionally qualified valuators.

MH will continue with the cost model as the revaluation model would continuously change the value of PP&E, increasing the volatility of depreciation expense due to changes in the fair value of the assets and potentially increasing the need for customer rate changes.

3.3.3 Componentization/Depreciation

Under GAAP, depreciation must be recognized in a rational and systematic manner over the estimated useful life of the asset. Depreciation methods and estimates of the life and useful life are reviewed on a regular basis; however, GAAP does not specify the frequency of a "regular" basis. MH currently completes a depreciation study every five years and at that time adjusts its depreciation methods and estimates as appropriate.

Under GAAP, if an item of PP&E is made up of significant separable component parts, its cost must be allocated to the parts when practicable and when estimates can be made of the lives of the separate components. MH's policy is to group assets and amortize them such that the combined cost of the assets is amortized over the estimated average useful life of the group of assets.

IFRS requirements are similar to GAAP requirements. However, IFRS is more rigorous in terms of identifying separate components and addresses non-physical components of assets. IFRS permits the grouping of assets in determining the depreciation charge as long as the assets are from a homogeneous group, are individually insignificant in value and have similar useful lives. To the extent that assets include components with different lives that would materially impact annual depreciation expense, these components must be either separately depreciated or a methodology must be utilized that recognizes the differences in service lives for purposes of calculating depreciation expense. The recognition of non-physical components means that the costs of major overhauls or inspections associated with a capital asset may need to be recognized separately and amortized over a shorter life than the life of the physical asset. MH reviewed its existing components and determined that further componentization was required primarily for generation and distribution assets. In addition, MH determined that a change in the methodology for determining depreciation would also be required in order to avoid the need to componentize to a very detailed level.

With the assistance of its depreciation consultant, Gannett Fleming Inc., MH has established new component groupings consistent with the requirements of IFRS, assuming a change to the Equal Life Group procedure for group depreciation and has completed a depreciation study based upon these new component groupings. Normally, a depreciation study process is routine and involves updating the retirement experience of existing asset classes and reviewing operational factors to assess what new considerations are warranted. However, because of the new component groupings required under IFRS, an extensive effort involving accounting and operational personnel was required to research historical records and to assess operational factors of all new, existing and modified component groupings in order to establish account balances and to estimate service lives. MH has implemented the new service lives that resulted from the depreciation study during its 2011/12 fiscal year. The impact of this change in estimate is a decrease to depreciation expense of $36 million, $39 million and $42 million in 2011/12, 2012/13 and 2013/14, respectively.

MH completed a new depreciation study in 2014 with the assistance of the same depreciation consultant, Gannett Fleming, Inc., based on the asset components established in 2011/12. A detailed review of asset activity was conducted by MH's accounting and operating staff, to understand the actual impacts of the previous componentization changes, and to incorporate operational findings from recent asset condition assessment reviews. As a result, some of the cost allocation and service life estimates made during the initial componentization in 2011/12 were refined to reflect actual experience. The impact of these changes in estimate is a further decrease to depreciation expense of $26 million for 2014/15.

3.3.4 Change to Equal Life Group Method

A further IFRS related enhancement to depreciation calculations is that of moving from the Average Service Life (ASL) procedure to the Equal Life Group (ELG) procedure.

The ASL procedure, which has been used by MH in the past, calculates depreciation expense based upon the average life of all assets within each class. Under this method, those assets that have a shorter life than average will not be fully depreciated when retired from service. Conversely, other assets in this class that have a longer life than average will be over-depreciated when they are retired from service. Where an asset component grouping includes assets with different service lives, this method is viewed as problematic from an IFRS perspective because, except for those assets which have a life exactly equal to the average service life of that group, assets are being depreciated over a longer or shorter timeframe than their expected service life. Such would be the case with MH's existing asset component groupings.

The ELG procedure addresses these issues by developing depreciation rates with specific consideration of the expected retirement pattern for each asset type within each depreciation class. Every asset in the class is depreciated over its own expected service life and therefore is expected to be fully depreciated (not over or under depreciated) when it is removed from service. The resulting ELG depreciation expense calculations are in compliance with IFRS.

3.3.5 Gains and Losses on Disposal of Assets

Under existing GAAP, Canadian utilities are generally allowed to defer gains or losses that occur on the disposal of assets either through accumulated depreciation or a deferral account. Therefore the gains or losses are not immediately recognized in the income statement. MH currently recognizes gains and losses on the retirement of plant assets in accumulated depreciation.

IFRS requires that any gains and losses on disposal/retirement of assets be recognized immediately in income. As indicated in the previous section, when assets are retired from service under the ASL depreciation methodology, they are typically over or under depreciated. Under IFRS, assets that are over or under depreciated when they are removed from service will result in the recognition of a gain or loss. A further advantage of the ELG depreciation methodology is that depreciation expense is calculated such that the gains or losses upon asset retirements are minimized or eliminated which reduces the impacts on net income from asset retirements.

3.3.6 Elimination of Asset Removal Costs from Depreciation Rates

MH's depreciation rates currently include an amount for the costs to be incurred upon the removal of an asset. This is referred to as negative salvage value. This "precollection" of asset removal costs is maintained in accumulated depreciation reserves, and when assets are ultimately removed from service, the costs associated with the removal of an asset are charged against that reserve. Under this methodology, there are no direct charges against income for asset removal costs.

Negative salvage is not an eligible cost of self-constructed PP&E under IFRS. As the IASB allows rate-regulated entities to carry over the net book value of PP&E upon transition to IFRS, any existing negative salvage amounts included in accumulated depreciation will form part of the deemed costs of assets on transition.

Upon transition to IFRS, MH is eliminating the inclusion of negative salvage in depreciation rates as a means to offset other financial impacts associated with the transition. To the extent that it is necessary to remove an asset in order to replace it, the costs of removal of replaced assets will be capitalized as a cost component of the replacement asset. All other asset removal costs will be charged against income as incurred.

3.3.7 Provisions - Asset Retirement Obligations (ARO)

The concept of provisions under IFRS encompasses a wider range of circumstances that may result in the recognition of more liabilities than GAAP. Under IFRS, the threshold for recognizing a liability or provision is whether the underlying event giving rise to the liability or provision is probable or “more likely than not”. This is lower than the “likely” threshold under GAAP and could lead to additional provisions being recognized under IFRS. In addition, under IFRS provisions must be recognized when they can be reliably estimated, and only in rare circumstances is it presumed that an estimate cannot be made.

Under GAAP, an asset retirement obligation is recorded if an entity has a legal obligation to incur an expenditure in the future associated with the retirement of an asset currently in use. IFRS requires a liability to be recorded for constructive obligations as well as for legal obligations. A constructive obligation is derived from an entity’s actions by way of an established pattern of past practice, published policies or a specific current statement whereby the entity has indicated to other parties that it will accept certain responsibilities such that the other parties expect the entity to discharge its responsibilities.

Under GAAP, MH has recognized AROs for the decommissioning of a thermal generating station and for the partial decommissioning of a hydraulic generating station spillway. MH has reviewed its circumstances and has concluded that no new provisions exist pertaining to constructive obligations relating to ARO’s. MH will recognize such obligations when a commitment is made to decommission an asset and significant removal and/or remediation costs are expected to be incurred.

3.3.8 Capitalization of Borrowing Costs

Under current GAAP, carrying costs such as interest that are directly attributable to the construction of an asset may be capitalized (Interest During Construction or IDC). IFRS requires that actual borrowing costs for a period be capitalized to an asset that takes a substantial period of time to get ready for use. A substantial period of time is not a defined term and requires judgment in its application. MH has reviewed the average time period for construction of its major capital projects and has concluded that there will not be a significant change in projects eligible for interest capitalization.

MH has also reviewed the specific items included in the calculation of the interest capitalization rate for general asset additions and has made the necessary adjustments required for compliance with IFRS. The interest capitalization rate will now consist of the weighted average debt rate for all debt outstanding for the period, including anticipated borrowings in the upcoming fiscal year. MH implemented this change for its 2010/11 fiscal year under Canadian GAAP.

IFRS requires the segregation of specific and generally financed capital projects where possible in order to determine the borrowing costs eligible for capitalization. Therefore, where debt is designated to finance a particular capital project, MH will capitalize interest to the asset based on the interest rate from that designated debt issue.

3.3.9 Transitional Requirements (IFRS 1)

As the IASB allows rate-regulated entities to carry over the net book value of PP&E upon transition to IFRS, any existing capitalized interest included in PP&E may form part of the deemed costs of PP&E on transition. Therefore, no April 1, 2014 retroactive adjustment is required to adjust for differences in capitalized borrowing costs. In addition, there are no April 1, 2014 retroactive adjustments that are required for componentization, the change to ELG and the removal of negative salvage from depreciation rates. However, the net impact of the move to ELG and the removal of asset retirement costs from depreciation rates will result in an increase in retained earnings of $26 million in 2014/15.

3.3.10 Summary of Impacts

The following table summarizes the adjustments to retained earnings upon transition to IFRS for items pertaining to PP&E:

Table 3.3.1 Summary of Transitional Adjustments
(In millions of dollars)

Item	Electric Fiscal 2014/15	Gas Fiscal 2014/15	Consolidated
Change to ELG	(33)	(3)	(36)
Removal of the pre-collection of Retirement Costs	57	5	62
Increase to Retained Earnings	**24**	**2**	**26**

The following table summarizes the net income impact in 2015/16 for items pertaining to PP&E:

Table 3.3.2 Summary of Net Income Impacts
(In millions of dollars)

Item	Electric Fiscal 2015/16	Gas Fiscal 2015/16	Consolidated
Change to ELG methodology	(36)	(2)	(38)
Removal of Net Salvage	60	4	64
Net Income Increase (Decrease)	**24**	**2**	**26**

3.4 Capitalization of Overhead Costs

Under GAAP, MH has historically applied a full cost accounting methodology. Tangible and intangible assets are stated at cost which includes direct labour, materials, contracted services, a proportionate share of overhead costs and interest applied at the average cost of debt. Overhead costs allocated to capital included support staff (Finance, Human Resources, Information Technology, Corporate, Legal, etc.), management time, training, depreciation, interest and facility related charges. This approach recognized that MH is both a construction and operating company and thus, maintains integrated resources in order to sustain all aspects of its operations.

IFRS requires that PP&E and intangible items that qualify for recognition as an asset shall be measured at cost which includes direct costs, such as materials, and all overhead costs that can be directly attributable to capital projects and intangible assets. IFRS identifies costs that are not eligible for capitalization such as the following:

a) Costs of opening a new facility;
b) Costs of introducing a new product or service (including costs of advertising and promotional activities);
c) Costs of conducting business in a new location or with a new class of customer (including costs of staff training); and
d) Administration and other general overhead costs

Based on a review of its existing cost capitalization practices, and considering industry trends to move away from full cost accounting, MH has eliminated the following cost components from its capitalized overhead under GAAP (totaling $62 million annually through to the end of 2012/13):

Table 3.4.1 Costs no Longer Capitalized

Reduction to Costs Capitalized in fiscal 2008/09 (In millions of dollars)**:**

Interest and Facilities Overhead on Stores	**5**

Reduction to Costs Capitalized in fiscal 2009/10 (In millions of dollars)**:**

Executive Costs	2
Property Taxes on Facilities	2
Total	**4**

Reduction to Costs Capitalized in fiscal 2010/11(In millions of dollars)**:**

Interest on Common Assets (Facilities & Equipment)	12
General and Administrative Departmental Costs	5
Interest on motor vehicles	4
Total	**21**

Reduction to Costs Capitalized in fiscal 2012/13 (In millions of dollars)**:**

IT Infrastructure and Related Support	21
Building Depreciation and Operating Costs	11
Total	**32**

MH has completed its review of its capitalization methodology, including the cost components and activities currently being capitalized to assess costs eligible for capitalization under IFRS. This review considered all guidance available in the accounting standards, interpretations from the major international accounting firms (including Ernst & Young), as well as information from the CEA and other Canadian utilities. The review concluded that an additional $58 million (Electric - $55 M, Gas $3 M) of annual charges do not meet the IFRS criteria for capitalization. A summary of these ineligible charges is as follows:

Table 3.4.2 Additional Costs Ineligible for Capitalization upon Transition to IFRS
(In millions of dollars)**:**

Technical and Soft Skills Training	17
Service Areas (Management accounting, Treasury, HR, Safety, etc)	13
Administrative & Clerical Support Staff	13
Division and Department Manager	14
Fleet & Stores Administration	1
Total	**58**

The $58 million of ineligible charges consists of expenditures where a direct link to a specific capital asset cannot be made due to the nature of the expenditure or expenditures for items such as training which is explicitly disallowed for capitalization by IFRS unless incurred in respect of specific staff to commission a specific asset.

Systems and process changes to facilitate the accounting of capitalized costs in an IFRS compliant manner will be completed for implementation in fiscal 2014/15 to allow for comparative year reporting.

3.4.1Transitional Requirements (IFRS 1)

The IASB allows rate-regulated entities to carry over the net book value of PP&E upon transition to IFRS and thus, any existing capitalized costs included in PP&E may form part of the deemed costs of PP&E on transition. Therefore, no retroactive adjustment is required to adjust the differences in capitalized overhead costs to April 1, 2014. However, $56 million of expenditures capitalized under GAAP for the fiscal 2014/15 fiscal year will have to be adjusted to retained earnings upon transition to IFRS.

3.5 Employee Pension and Benefits

There are a number of differences that will result from adopting IFRS for defined benefit pension plans and other employee benefits.

3.5.1 Return on Plan Assets

The expected return on plan assets forms part of the annual pension expense. GAAP currently allows the expected return on plan assets to be based on either the fair value or a market-related value (moving average not exceeding a period of five years) of the assets. MH currently uses market-related values to estimate the expected return on plan assets and to apply experience gains and losses in the corridor calculation. A market-related value approach reduces volatility of actuarial gains and losses on the expected annual return on plan assets and subsequent amortization of balances outside the corridor, therefore, reducing volatility on annual pension expense.

Under IFRS, the expected return on plan assets is replaced by interest income calculated using the fair value of plan assets with the same discount rate used to measure the pension obligations.

3.5.2 Past Service Costs

GAAP allows past service costs associated with plan improvements/amendments to be recognized over the average remaining service life of the employee group. MH has implemented pension plan improvements that contain both vested and non-vested components and is currently amortizing those improvements over the average remaining service life of the employee group.

Under IFRS, past service costs associated with plan improvements/amendments are recognized as expense through profit or loss when the amendment or curtailment occurs.

3.5.3 Discount Rate

GAAP CICA section 3461.063 states that "*the discount rate used to determine the accrued benefit obligation shall be the interest rate determined by*

a) market interest rates at the measurement date on high-quality debt instruments with cash flows that match the timing and amount of expected benefit payments; or
b) The interest rate inherent in the amount at which the accrued benefit obligation could be settled.

The Canadian GAAP requirement is similar to the IFRS standards. IAS 19.83 states that, "*the rate used to discount post-employment benefit obligations (both funded and unfunded) shall be determined by reference to market yields at the end of the reporting period on high quality corporate bonds. In countries where there is no deep market in such bonds, the market yields (at the end of the reporting period) on government bonds shall be used.*"

MH determines an annual discount rate which complies with the recommendations of the Canadian Institute of Actuaries, GAAP and IFRS. MH validates the selection of its discount rate with its external actuary, as well through the review of discount rates used by other Canadian utilities and the Civil Service Superannuation Board. Based on the similarities between the Canadian GAAP and IFRS requirements, MH does not anticipate changing the manner in which it determines its annual discount rate upon transition to IFRS.

3.5.4 Amended IFRS for Employee Benefits (IAS 19)

In April 2010, the IASB issued the "Defined Benefit Plans" Exposure Draft as part of its project to improve the accounting for employee benefits. This Exposure Draft did not require significant changes to the measurement provisions, but proposed significant changes to the recognition, presentation and disclosure of defined benefit plans. In June, 2011, the IASB published the amended standard on employee benefits; effective for annual periods beginning on or after January 1, 2013.

In addition to the fore-mentioned differences between IFRS and GAAP for pension accounting, the significant changes introduced by the amended standard that impact MH are as follows:

- That entities recognize re-measurements (actuarial gains and losses) and adjustments related to changes in the value of the defined benefit obligation and in the value of the plan assets only in Other Comprehensive Income (OCI) in the period in which they occur with no subsequent recycling to net income.
- Under IFRS, the expected return on plan assets is replaced by interest income calculated using the fair value of plan assets with the same discount rate used to measure the pension obligations. Currently under GAAP, the expected return on plan assets is calculated using a forecast rate of expected return appropriate for the plan asset mix of investments.
- That additional disclosure be provided that focuses on the characteristics of defined benefit plans and the risks associated with the plans.
- That the IFRS 1 exemption allowing an entity to adjust all unamortized actuarial gains and losses to retained earnings upon transition be eliminated.

3.5.5 Transitional Requirements (IFRS 1 – Amended IAS 19)

The amended IAS 19 is effective for MH for the 2014/15 IFRS comparative fiscal period, but early adoption is permitted. A first time adopter must retrospectively apply the Standard in the financial statements beginning on or after January 1, 2013. MH is adopting the amended IAS 19 upon transition to IFRS on April 1, 2015. The cumulative re-measured and restated unamortized experience gains and losses for the comparative year will be recalculated under IAS 19 and reclassified to Accumulated Other Comprehensive Income as of April 1, 2014.

3.5.6 Employee Benefits

MH offers accumulating benefits for service and currently under GAAP recognizes obligations for the vested portions only.

IFRS recognizes an obligation as an employee renders service regardless of vesting criteria. Therefore, under IFRS, actuarial obligations must be recognized for all accumulating benefit plans such as sick leave and severance.

Under IFRS, experience gains and losses resulting from actuarial valuations for certain long-term employee benefits such as MH's Retiree Health Spending Account and long-term disability must be expensed when determined. Under GAAP, these gains and losses may be amortized over the period until the next actuarial valuation (3 years for MH). Upon transition to IFRS, MH will adjust to retained earnings any unamortized gains and losses for such benefits.

The following table identifies the April 1, 2015 consolidated transitional adjustments associated with employee benefits:

Table 3.5.1 Transitional Adjustments – Employee Benefits
(In millions of dollars)

Item	Retained Earnings
Unamortized Past Service Amendments for Retiree Health Spending Account	(9)
Unamortized Experience Losses for Long-term Disability Account	-
Recognize Unvested Sick Leave liability	(7)
Recognize Unvested Severance liability	(8)
Increase (Decrease)	**(24)**

3.6 Financial Instruments

For the most part, GAAP is substantially harmonized with IFRS with the introduction of standards 3855 *Financial Instruments – Recognition and Measurement* and 3865 *Hedges*, implemented by MH in the 2007/08 fiscal year. Under the existing IFRS guidance, *Financial Instruments Recognition and Measurement*, MH's financial assets such as customer loans and accounts receivable would continue to be classified as loans and receivables, initially recorded at fair value and subsequently measured at amortized cost. Long term debt and other financial liabilities would continue to be initially recorded at fair value, and subsequently measured at amortized cost using the effective interest method.

Any unrealized foreign exchange gains and losses would be recorded to net income when there is no accounting hedge in place. U.S. sinking funds would continue to be classified as available-for-sale, however IFRS allows for a “natural” hedging of foreign exchange risk on foreign currency. Under IFRS, foreign exchange gains and losses related to available-for-sale monetary financial assets are recorded in net income. This means MH will continue to record foreign exchange gains/losses on its sinking fund investments in net income without the GAAP requirement to maintain a designated accounting hedge relationship between the U.S. sinking fund and the associated U.S. debt. Under both GAAP and IFRS, fair value changes related to changes in interest rates continue to be recorded in Other Comprehensive Income.

3.6.1 Hedges

As described above, GAAP requires that foreign exchange gains and losses on available for sale sinking fund assets be recorded in Other Comprehensive Income. However, designating these investments in a fair value hedge relationship has allowed MH to record offsetting foreign exchange translation gains and losses on the U.S. sinking funds (hedged item) and corresponding U.S. debt (hedging item) to net income. Under IFRS, the monthly translation of U.S. sinking fund investments would be recorded in net income as will off-setting changes in the fair value of the US debt, without the need for hedge accounting. Therefore, these fair value hedges are no longer required under IFRS.

MH’s current cash flow hedges between anticipated U.S. revenues (hedged item) and U.S. debt (hedging item) are not expected to be impacted by the transition to IFRS.

3.6.2 Commodity Contracts

Under IFRS, commodity contracts that can be settled either in cash or by another financial instrument, and do not meet the “own-use” scope exception are within the scope of IAS 39 and should be accounted for as a non-financial derivative, consequently subject to fair value accounting treatment. The “own-use” exception relates to contracts for non-financial items that were entered into and continue to be held for the purpose of the receipt or delivery of the non-financial item in accordance with the entity’s expected purchase, sale or usage requirements.

In principle, this exemption provides MH with the ability to exclude the majority of its commodity purchase and sales contracts from fair value accounting treatment, as the majority of its commodity contracts are used within the normal course of its business to deliver physical energy to and from varying locations. However, there are certain instances where the "own-use" exemption may not be available under IFRS. MH has developed an on-going review process of all commodity contract terms to assess whether the own use exemption applies.

Natural gas fixed price swaps utilized in the Primary Gas Fixed Rate Service have been identified as financial derivatives and are currently being measured at fair value on the balance sheet with changes in fair value recorded to net income. There are no accounting changes required for these contracts under IFRS.

3.6.3 IASB Future Developments – Financial Instruments

Since November 2008, the IASB has been working on a project to replace IAS 39, Financial Instruments: Recognition and Measurement with a new standard, IFRS 9. The IASB issued IFRS 9, Financial Instruments in July 2014. IFRS 9 is applicable from January 1, 2018 and focuses on the classification and measurement of financial assets and liabilities, impairment methodology for financial assets and hedge accounting.

The objective of this standard is to improve the usefulness of financial statements by simplifying the classification and measurement requirements for financial instruments. The impairment requirements will be applied to financial assets based on an expected credit losses model, rather than the current incurred loss model in IAS 39. New hedge accounting guidance will align hedge accounting with risk management, allowing certain changes to the hedge relationship after inception of the hedge.

Some of the potential impacts to MH from the new standard are as follows:

- Sinking funds would be reclassified from the current available-for-sale category to amortized cost;
- There will no longer be the requirement to recognize changes in fair value due to changes in interest rates for sinking fund assets in Other Comprehensive Income; and
- Hedge accounting effectiveness testing will be more closely aligned with risk

management and will be simplified by eliminating the 80% - 125% bright line and retrospective testing.

3.7 Leases

In general, the principles relating to accounting for leases under CICA standard 3065 Leases and IFRS are converged, except that:

a) IFRS uses the term “finance lease” in the same manner as Section 3065 uses “capital lease”;
b) IFRS does not subdivide finance leases into sales type leases and direct financing leases; and
c) The disclosure requirements differ.

Both standards classify leases based on whether or not substantially all the risks and rewards incidental to ownership are transferred. GAAP, however, provides more quantitative thresholds for evaluating whether a lease is a capital or operating lease. IFRS does not contain such quantitative thresholds. The interpretations provided under GAAP for determining whether an arrangement contains a lease are primarily the same under IFRS.

MH has reviewed its agreements and has not identified any additional leases that are required to be recognized upon transition to IFRS.

3.7.1 IASB Major Project on Leases

As part of a joint project with the US Financial Accounting Standards Board (FASB), in August 2010, the IASB issued an Exposure Draft on Leases. The Exposure Draft was proposed to correct for issues in existing standards which have been criticized for not meeting the needs of the users of the financial statements as they do not provide a faithful representation of leasing transactions. The IASB believes that existing standards fail to recognize rights and obligations that meet the definition of assets and liabilities within the existing IFRS framework. The significant changes proposed by the Exposure Draft were as follows:

- The distinction between finance and operating leases is discontinued;
- The Lessee would apply a *right-of-use* model that would recognize an asset for its right to use an asset and a liability for its obligation to make lease payments; and

- The Lessor would recognize an asset representing its rights to receive lease payments and, depending on the circumstances of the lease, recognize a lease liability while continuing to recognize the underlying asset or de-recognize the portion of the underlying asset that is transferred to the lessee.

In general, the feedback received on the ED indicated that the proposals were overly complicated and would be costly to implement. As a result, The IASB and FASB conducted a long and extensive outreach process across all major geographical regions involving round table discussions, preparer workshops, meetings, webcasts and publications. Overall, there has been support for the “right of use model” and it has generally been accepted that lease contracts result in assets and liabilities.

Having worked through many of the complications identified in the feedback, in May 2013, the IASB and FASB issued a revised exposure draft that incorporates many aspects of the earlier exposure draft and proposed a dual model approach for lessee accounting, under which a lessee would classify each lease as other Type A or Type B. As well, a lessee would recognize a right-of-use asset and a lease liability for all leases of more than 12 months and can choose not to do so for leases of 12 months or less.

The main feedback received was that the dual model proposed for lessees was too complex. As such, the IASB is recommending a single lease accounting model for lessees in which all leases would be recorded on the balance sheet except for short term leases and small ticket leases. The IASB also decided no significant changes are required to the current guidance offered to lessors in IAS 17, Leases.

Further deliberations are necessary before the IASB can issue the new standard, expected in 2015. FASB had decided to pursue its own standard.

3.8 Customer Contributions

Under GAAP, non-refundable contributions in aid of construction are separately recorded on the balance sheet and amortized to income on a straight-line basis as a reduction to depreciation over the life of the related item of PP&E. Refundable contributions are recorded in Other Long-term Liabilities by MH, and are refunded to customers if the criteria for the refund have been met.

Under IFRS, customer contributions are to be recognized as revenue; either immediately or over some future period of time. The customer contribution is recognized as revenue based upon fulfillment of the performance obligations of the underlying arrangement. An entity in receipt of a capital contribution is required to assess if separately identifiable services have been provided. That is, the utility must assess if the capital contribution is solely for the purpose of connecting the customer to the utility's grid such that the utility has no obligation beyond connecting the customer or if the contribution is also linked to the ongoing supply of energy. If it can be demonstrated that the service connection represents stand-alone value to the customer then the customer contribution should be recognized as revenue immediately. If it can be demonstrated that the contribution can be linked to the ongoing supply of energy, then all revenue arising from the contribution is deferred and amortized to income as the service is provided.

MH has reviewed its customer contribution arrangements and has concluded that the service connection to the customer does not have stand-alone value as the customers are not allowed to choose their energy distributor in Manitoba and are not able to resell connection assets that they do not own (such assets are the property of MH). The sole purpose of the connection is to provide access to an ongoing supply of energy (electricity or gas) from MH as a customer would derive no value from a connection without the future supply of energy. As the connection does not have stand alone value for the customer, the revenue should be recognized over time as energy is provided to the customer. If the arrangement does not specify a period, the revenue shall be recognized over a period no longer than the useful lives of the connection assets.

This will result in no impact to net income. However, classification on the income statement will change as the amortization of the contribution that was previously recognized as an offset in depreciation expense will now be recognized as revenue.

Under IFRS, the method for recognizing revenue related to refundable contributions would also change. The practice under Canadian GAAP excludes 100% of the refundable capital contributions from being amortized. Under IFRS, only the amount that is expected to be refunded would be excluded from the amount that is amortized into revenue.

3.9 IFRS 1 - Initial Adoption of IFRS

IFRS 1 requires an entity to comply with IFRS standards effective at the reporting date of the entity's first annual financial statements prepared and presented in accordance with IFRS. For MH, this would include IFRS standards in effect as of March 31, 2016. New accounting policies must be retrospectively applied (unless the relevant election is available and chosen) and adjustments made at the start of comparative period. Thus, for an entity adopting IFRS for the first time on April 1, 2015, it will be necessary to prepare and present a comparative opening balance sheet under IFRS as at April 1, 2014. In the comparative opening balance sheet, an entity must:

- Recognize all assets and liabilities that IFRS require be recognized;
- Derecognize from assets and liabilities those items for which IFRS do not permit recognition;
- Reclassify items when, in accordance with the GAAP previously followed by the entity, they would have been presented differently from how they would be in accordance with IFRS; and
- Apply IFRS in re-measuring all recognized assets and liabilities.

The underlying principle in IFRS 1 is that a first time adopter should prepare and present financial statements as if it had always applied IFRS. This will require the retrospective adjustment of accounts. However, there are certain exemptions and/or elections to this general principle which allow prospective application. In addition, IFRS 1 prohibits retrospective application in certain areas.

There are IFRS 1 elections for areas including financial assets and liabilities, hedge accounting, business combinations, value of PP&E, leases, financial instruments, decommissioning liabilities and borrowing costs. Where applicable, MH has addressed the transitional elections it is considering in the various sub-sections of this report.

4.0 Financial Reporting & Disclosure

There are a number of differences in the disclosure requirements of GAAP compared to IFRS. Set out below is a summary of the major differences that are likely to arise on an on-going basis.

4.1 On-Going Disclosures - Primary Statements

Under IFRS, there will be a number of changes to the primary financial statements which include the income statement, balance sheet and cash-flow statement. The following section outlines these changes.

Statement of Income

Under IFRS, the presentation of the income statement will be similar to GAAP. However, MH will be required to present its expenses based on their nature or by function. In addition, the new interim standard for Regulatory Deferral Accounts requires the net movement in all regulatory account balances that impact net income to be presented separately from the non-regulatory account income and expenses and other comprehensive income. This will be achieved by the use of a sub-total for the amount of profit or loss or other comprehensive income before the net movement in regulatory deferral account balances.

Statement of Financial Position (Balance Sheet)

MH expects changes to the current presentation of the statement of financial position with respect to balances currently disclosed as “other assets” and “other liabilities” which will need to be classified according to their type. In addition, MH will be required to follow the new interim standard for Regulatory Deferral Accounts and present sub-totals of all assets and liability balances before regulatory deferral account debit and credit balances which will be presented on separate lines.

Statement of Cash-Flow

Under IFRS, MH will have the choice of presenting its cash-flow on a direct or indirect basis. Currently MH discloses on a direct basis. In addition, MH will have the choice of presenting cash-flows from interest received as either operating or investing activities and cash-flows from interest paid as either operating or financing activities.

Incremental disclosures include:

- Separate disclosure of disposal proceeds and capital contributions received;
- Disclosure of total amount of interest paid (whether expensed or capitalized); and
- Reconciliation of cash-flows from operating activities to net income.

Other

MH will be required to present a separate statement of changes in equity. This will incorporate information currently presented in the statement of retained earnings and the statement of Accumulated Other Comprehensive Income.

4.2 On-Going Disclosures - Notes to the Financial Statements

Under IFRS, there will be a number of changes to the notes to the financial statements which are outlined below.

IFRS 14 - Regulatory Deferral Accounts

The new interim standard for Regulatory Deferral Accounts requires extensive disclosures intended to assist the reader in understanding the nature of, and the risks associated with the rate regulation that restricts the prices the entity can charge. As per the interim standard, for each portion of rate-regulated activities that is material to the financial performance of the entity, an entity shall disclose:

(a) a brief description of the nature and extent of the rate-regulated activities and the nature of the regulatory rate-setting process;

(b) the identity of the rate regulator; and

(c) how the future recovery of each regulatory deferral account debit balance or reversal of each regulatory deferral account credit balance is affected by risks and uncertainty, for example:

(i) demand risk;

(ii) regulatory risk; and

(iii) other risks (for example, currency or other market risks).

In addition to the above, the new standard requires an entity to disclose the following for each material regulatory account:

- The basis on which regulatory deferral account balances are recognized and measured initially and subsequently;
- A reconciliation of the carrying amount at the beginning and the end of the period;
- The amounts that have been recognized in the current period in the statement of financial position as regulatory deferral account balances to be recovered or reversed in the current or future periods;
- The amounts that are recognized in the statement of profit or loss and other comprehensive income relating to balances that have been recovered, amortized or reversed in the current period;
- The rate of return applicable to each class of regulatory deferral account; and
- The remaining periods over which the entity expects to recover or amortize the carrying amount of each regulatory deferral account.

Property, Plant and Equipment

Under IFRS, there will be the requirement to present a detailed continuity schedule for each class of PP&E. In addition, given that MH will elect to deem its net book value on transition as its opening cost under IFRS, this will require that accumulated depreciation be set to zero.

Pension Assets and Liabilities

IFRS requires disclosure of the amounts for the current and previous periods of: the present value of the defined benefit obligation; the fair value of plan assets, any surplus or deficit in the plan; and experience adjustments on plan liabilities and plan assets.

Provisions and Asset Retirement Obligations

IFRS requires disclosure of detailed continuity schedules for each class of provisions.

Harmonization of Accounting Policies

IFRS requires uniform accounting policies to be applied to all entities in a consolidated group. Manitoba Hydro will be harmonizing its accounting policy with respect to costs associated with its Meter Sampling, Exchange and Testing program. Prior to the transition to IFRS such costs were capitalized for the Electric operations and expensed for the Gas operations. The harmonization of accounting policies will result in an increase to net income of $5 million for 2015/16.

Other

IFRS requires disclosure of related party information, including details of the entity's parent and controlling party as well as greater disclosure of judgments and estimates in the financial statements.

4.3 Initial adoption of IFRS (IFRS 1)

The first accounts that are prepared under IFRS are required to include a number of extensive reconciliations and narratives showing the effects of the transition from GAAP to IFRS. This information must include details of key changes in accounting policies, IFRS 1 elections made and measurement differences from GAAP.

MH is in the process of reviewing changes in financial statement presentation, required disclosures and related system and process changes for transition to IFRS.

5.0 Key Systems & Processes

As identified early in the project, the conversion to IFRS will have impacts on systems and related business processes. MH established an information technology (IT) team to identify and address these impacts. As part of this work, MH reviewed the capability of its SAP system to produce the required financial information for the 2014/15 comparative fiscal period and forward. Through this review, MH concluded that, with modifications, the existing SAP system is capable of meeting the financial reporting requirements under IFRS. MH is also reviewing financial systems that interface with SAP to ensure they will also be capable of meeting the financial reporting requirements.

MH has issued an RFP seeking consulting expertise to assist with the design of the technical SAP system solution required to facilitate financial statement changes required as part of the transition to IFRS.

The key areas of IFRS that will impact systems and processes are:

5.1 Componentization of Property Plant & Equipment

This change will require that capital project forecasts and expenditures be further delineated into constituent components. The SAP system is capable of providing the framework necessary to facilitate these changes. Fixed Asset ledgers have been updated with new component groupings. There will be a large element of change management and training to ensure that new requirements are properly understood and adhered to across the organization.

5.2 Calculation of IFRS Compliant Depreciation

Under GAAP, depreciation expense calculations incorporate factors relating to the service life of assets and cost of removals using a mass property approach based upon historical plant values. Under IFRS, the depreciation method will change from the average service life method to the equal life group approach. The SAP asset management system is capable of providing the framework necessary for this work as new opening component balances are being determined and depreciation calculation processes utilizing the ELG approach have been put in place. There is a significant effort to transfer existing assets and ongoing projects into their new components. New routines will also be developed to ensure that asset retirements are identified and processed in more detail than previously required under GAAP.

5.3 Changes to Cost Allocations

Under IFRS, administration and other general overhead costs can no longer be capitalized. Work to ensure that the costing systems and processes capture and allocate costs to capital projects in a manner that is IFRS compliant is near completion. This required changes to activity rates used for capitalization, as well as changes to overhead rates and internal cost allocation routines. It required changes to time carding instructions and processes to ensure that costs charged are properly linked to the capital projects to which they pertain. The basic cost allocation framework developed in SAP was capable of meeting these requirements. Subsystems were assessed to ensure that the correct IFRS compliant information was being provided into the system and processed correctly.

Work to allow for the accounting of capitalized costs in an IFRS compliant manner will be completed for implementation in fiscal 2014/15 to allow for comparative year reporting.

5.4 Presentation of Regulatory Deferral Accounts

Under IFRS, regulatory deferral accounts will be required to be separated in the presentation of the Statement of Income and Statement of Financial Position. In addition, IFRS requires extensive note disclosure with respect to the regulatory deferral accounts. MH’s existing systems maintain separate accounts for each of its existing regulatory account balances and it is anticipated that these systems will be capable of capturing the information required for both the financial reporting and note disclosure requirements under IFRS.

6.0 IFRS Changes

MH is required to prepare its first set of IFRS financial statements in accordance with the standards that are in effect as at the end of the first year of adoption of IFRS (i.e. March 31, 2016). MH chooses its accounting policies based on these standards and then applies them from the beginning of the comparative period, i.e. from April 1, 2014. MH's preliminary accounting policy choices as set out in this report, should not therefore, be considered final and may continue to evolve as the IFRS standards themselves change both before and after the transition date.

The IASB has a very active agenda and a number of projects may impact MH significantly. The effective date of any IFRS amendments and new standards is usually 6-18 months after their publication date. However, the IASB considers all relevant facts including whether to allow early adoption. It is important to note that many IFRS requirements will not change between now and fiscal 2015/16. However, there are significant changes to IFRS that have been published which may have an impact to MH. There are several active projects of the IASB that may have implications to MH post transition to IFRS.

Set out below is a summary of recent IFRS changes that may be relevant to MH:

Table 6.1 Relevant IFRS Changes

Topic	Issues	Timing
Rate Regulated Accounting	In April 2013, the IASB issued an exposure draft "*Regulatory Deferral Accounts*" which proposed an interim standard permitting rate-regulated entities that are 1st time adopters of IFRS to continue to recognize their regulatory accounts on an interim basis until the comprehensive project on rate-regulated activities is complete.	On January 30, 2014, the IASB issued an interim standard IFRS 14 - *Regulatory Deferral Accounts* effective January 1, 2016 with earlier application permitted. MH will early adopt the new standard effective April 1, 2015 upon its transition to IFRS.
	The IASB committed to developing a Discussion Paper to assess whether and how the IASB should develop an IFRS reflecting the impact of rate-regulation.	On September 17, 2014 The Discussion Paper "Reporting the Financial Effects of Rate Regulation" was issued and describes a type of rate regulation that contains elements of both cost recovery and incentive approaches. The Discussion paper considers the common features of rate regulation and explores which of them, if any, creates a combination of rights and obligations that is distinguishable from rights and obligations arising from non rate-regulated activities. The deadline for comments for the Discussion Paper is January 15, 2015.

Topic	Issues	Timing
Financial Instruments	The IASB completed a three-part project to replace IAS 39, Financial Instruments: *Recognition and Measurement* with a new standard, IFRS 9. The three main parts of the project are: a) Classification and measurement; Eliminated Held-to-Maturity, Available-for-Sale, and Loans and Receivables categories. New categories for financial assets are limited to fair value and amortized cost. Classification of financial assets is based on cash flow characteristics and the business model in which the asset is held. b) Amortized cost and impairment (loan loss provisions); Introduced a new expected loss impairment model that will require more timely recognition of expected credit losses. c) Hedge accounting. The general hedging model attempts to: - Align hedge accounting more closely with risk management - Simplify effectiveness testing by eliminating the 80% - 125% bright line test. - More principal based approach to hedge accounting. - Address inconsistencies and weaknesses in the existing model in IAS 39.	Classification and measurement of financial assets and liabilities was completed in 2010 In November 2012, the IASB issued an exposure draft on limited amendments to classification and measurement requirements of IFRS 9. In July 2013 the IASB deferred the effective date of IFRS 9 from January 1, 2015 to an unspecified date, pending the completion of the impairment and classification and measurement phases. Supplementary document *Financial Instruments: Impairment* was published in January 2011. Comments closed in April 2011 and an exposure draft was issued March 2013. In September 2012, the IASB issued a review draft of the forthcoming general hedge accounting requirements to be added to IFRS 9. Comments received on this review draft were considered and in November 2013, a general hedge accounting model was finalized. A companion project to address macro hedging was started and a discussion paper is targeted for 2014. In July 2014, the IASB issued IFRS 9, Financial Instruments to replace IAS 39, effective January 1, 2018 with earlier application permitted. MH will not early adopt this standard.

Topic	Issues	Timing
Fair Value Measurement Guidance	New standard (IFRS 13 Fair Value Measurement) issued by IASB in May, 2011. - IFRS 13 defines fair value and sets out in a single standard a framework for measuring fair value. - Describes how to measure fair value when another IFRS standard requires fair value.	To be applied prospectively for annual periods beginning on or after January 1, 2013, with early application permitted.
Consolidations	New standard (IFRS 10 Consolidated Financial Statements) issued by IASB in May, 2011. IFRS 10 does not change consolidation procedures. It provides guidance on whether an entity should be consolidated by revising the definition of control. Establishes one control model that applies to all entities. June 2012, IASB published amendments to IFRS 10 to clarify the transitional requirements; limiting the requirement to provide comparative information to only the preceding comparative period.	IFRS 10 and the amendments to IAS 27 are effective for annual periods on or after January 1, 2013 and must be applied retrospectively. If adopted early, must be adopted with IFRS 11 (Joint Arrangements) and IFRS 12 (*Disclosure of Interests in Other Entities*).

Topic	Issues	Timing
Disclosure of Interests in Other Entities	IFRS 12 *Disclosure of Interests in Other Entities* was issued by the IASB in May 2011 and requires increased disclosure of relationships with subsidiaries. Expands disclosure requirements as parent now required to disclose summarized financial information for each subsidiary that has material non-controlling interest.	Effective for annual periods beginning on or after January 1, 2013, with earlier application permitted.
Presentation of Financial Statements	In June, 2011, the IASB issued amendments to IAS 1 *Presentation of Financial Statements* to change the grouping of items in OCI. Current and future changes to IFRS will result in increased recognition of items in OCI (eg. IFRS 9 Financial Instruments, IAS 19 Employee benefits). Items that could be reclassified to profit and loss at a future date (i.e. recycled) are to be classified separately from items that will never be recycled.	Amendments are effective for annual periods beginning on or after July 1, 2012.

Topic	Issues	Timing
Employee Benefits	In April 2010, the IASB issued the "Defined Benefit Plans" Exposure Draft as part of its project to improve the accounting for employee benefits. This Exposure Draft proposed significant changes to the recognition, presentation and disclosure of defined benefit plans. In June, 2011, the IASB published the amended standard on employee benefits; effective for annual periods beginning on or after January 1, 2013. The significant changes introduced by the amended standard that impact MH are as follows: • Entities recognize re-measurements (actuarial gains and losses) and adjustments in Other Comprehensive Income (OCI) in the period in which they occur with no subsequent recycling to net income. • The discount rate used to measure the defined benefit obligation will also be used to calculate the interest income on plan assets. • That additional disclosure be provided that focuses on the characteristics of defined benefit plans and the risks associated with the plans. • That the IFRS 1 exemption allowing an entity to adjust all unamortized actuarial gains and losses to retained earnings upon transition be eliminated. • The distinction between short-term and other long-term benefits is based on the expected timing of settlement rather than the employee's entitlement to the benefit.	On June 16, 2011 the IASB issued IAS 19 Employee Benefits, which is effective from January 1, 2013. These amendments finalize proposals in the exposure draft Defined Benefit Plans, published in April 2010. MH is adopting the amended IAS 19 upon transition to IFRS on April 1, 2015. Cumulative unamortized experience gains and losses as recalculated under IAS 19 will be reclassified to Accumulated Other Comprehensive Income at that time.

Set out below is a summary of IFRS projects that may be relevant to MH post transition to IFRS:

Table 6.2 Relevant IFRS projects

Topic	Issues	Timing
Leases	IASB and FASB are reconsidering the accounting for leases. An exposure draft was issued in August 2010 which included the elimination of operating and finance lease classifications. Comments indicated the proposed amendments were too complex. In May 2013, a revised exposure draft was issued proposing a dual approach to lease recognition (one approach for depreciable assets and one approach for land and long-lived property). The main feedback received on the 2013 exposure draft was that the dual model proposed was too complex. As such, the IASB is recommending a single lease accounting model for lessees and has decide no significant changes are needed to the current lessor accounting model.	The IASB expects to issue a new Leases Standard in 2015.

Topic	Issues	Timing
Revenue Recognition	IASB and FASB to develop a single comprehensive set of principles for revenue recognition on when and how revenue should be recognized; to improve comparability over a range of industries / companies and countries. Exposure Draft was issued in June 2010. Comments on original proposal found it too complicated. Re-Exposure Draft was issued in November 2011. The key principles on which the Standard is based – that revenue is recognized on transfer to the customer, measured at the transaction price – are consistent with much of current practice. The IASB and FASB believe the Standard will improve financial reporting by: • Providing a more robust framework for addressing issues as they arise; • increasing comparability across industries and capital markets; • providing enhanced disclosures; and • clarifying accounting for contract costs.	The IASB and FASB have completed their re-deliberations of the comments on the revised ED with respect to recognition and measurement principles, scope, disclosure and transition. Project staff have begun drafting the final Revenue Recognition Standard. The new standard IFRS 15 Revenue from Contracts with Customers was issued in May 2014 and is effective January 1, 2017 with early adoption permitted.

Topic	Issues	Timing
Amendment to IAS 16 Property, Plant and Equipment and IAS 38 Intangible Assets – Clarification of Acceptable methods of Depreciation and Amortization	The objective of the proposed amendments is to ensure that preparers do not use revenue-based methods to calculate charges for the depreciation or amortization of items of PP&E or intangible assets. This is because a revenue-based method reflects a pattern of economic benefits being generated from the asset, rather than the expected pattern of consumption of the future economic benefits embodied in the asset. On December 4, 2012, the IASB issued an Exposure Draft of proposed amendments to paragraph 62 of IAS 16 and paragraph 98 of IAS 38 to state that a method of depreciation/ amortization that is based on the revenue expected to be generated from the use of an asset in an entity's business is not an appropriate method. On May 12, 2014 the IASB published "*Clarification of Acceptable Methods of Depreciation and Amortization (Amendments to IAS 16 Property, Plant & Equipment and IAS 38 Intangible Assets)*" which amends the requirements of IAS 16 and IAS 38 to clarify that a depreciation method that is based on revenue that is generated by an activity that includes the use of an asset is inappropriate. This is because such methods reflect a pattern of *generation* of economic benefits that arise from the operation of the business of which an asset is part, rather than the pattern of *consumption* of an asset's expected future economic benefits.	The amendments to IAS 16 and IAS 38 are effective for annual periods beginning on or after January 1, 2016 with earlier application permitted.

7.0 Next Steps

The next steps in the project will focus on ensuring that key systems and processes meet the accounting and reporting requirements for the 2014/15 comparative year and forward. This work will be performed with the assistance of MH's internal IT staff and SAP consulting expertise.

7.1 Advancing Topics to Phase 4 - Implementation

Most topics are at the end of the solution development stage where recommendations are being drafted, and implementation plans are being implemented. Any substantial system and process changes that are deemed to be appropriate to optimize related internal accounting processes pertaining to overhead capitalization policies will be developed and implemented for fiscal 2014-15. Detailed discussions with MH's external auditor Ernst & Young to obtain confirmation that MH has interpreted and applied IFRS consistent with their interpretation are ongoing.

7.2 Changes to Key Systems and Processes:

For each accounting topic analyzed by MH, key systems and related processes and interfaces were identified. As outlined in section 5.0 of this document, the key system changes identified in the project pertain to impacts created by the additional componentization of PP&E assets and changes to overhead capitalization policies. The current focus is to implement planned changes, ensure all interfacing systems and processes are modified accordingly, document new systems and processes where required and train all users of the various systems and processes.

7.3 Training Programs

Throughout the project, MH has incorporated training into the various phases. Where possible, those most impacted by IFRS related changes have been involved in the development of solutions and identification of issues and related systems and processes. The next phase of the training process is to work with those groups to formalize detailed training programs so as to embed IFRS into the "business as usual" practices of MH. It is expected that this form of training will focus on the accounting policies that are changing, the reason for the change, and the impact on the systems and processes, as well as additional training for staff that are the most impacted on a day to day basis.

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

APPENDIX 5.5
OPERATING, MAINTENANCE & ADMINISTRATIVE EXPENSE

1.0 OVERVIEW OF OM&A EXPENDITURES

The purpose of this Appendix is to provide an analysis of Manitoba Hydro's Operating, Maintenance and Administrative (OM&A) costs on an actual and forecast basis.

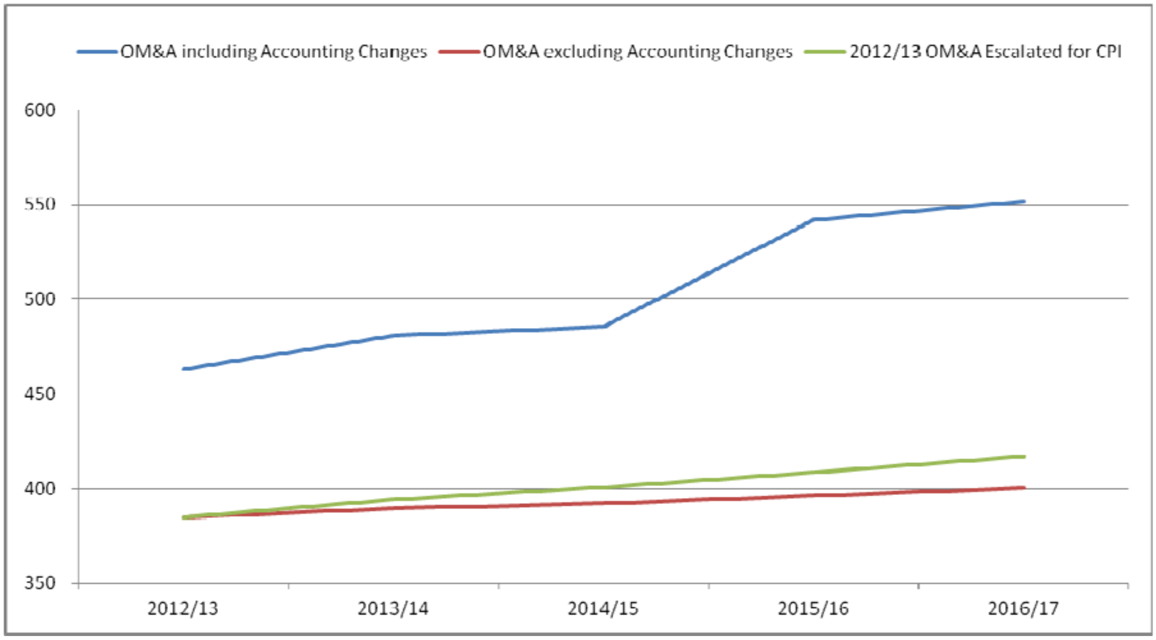
OM&A costs are recognized in accordance with Canadian Generally Accepted Accounting Principles (CGAAP) and apportioned to gas & electric utility operations through an integrated cost allocation methodology. In 2015/16 Manitoba Hydro will be transitioning to International Financial Reporting Standards (IFRS) and the impact on OM&A expenditures has been reflected in the forecasted costs for both the 2015/16 and 2016/17 fiscal years.

The following figures summarize OM&A costs and operating costs per customer for electric operations:

Figure 5.5.1 OM&A Costs Per Customer

	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast	Average Annual Increase
Electric OM&A, including Accounting Changes	$ 462 952	$ 480 717	$ 485 755	$ 541 740	$ 551 675	
Less:						
Accounting Changes	(78 345)	(91 155)	(93 858)	(145 644)	(151 345)	
Electric OM&A, excluding Accounting Changes	$ 384 607	$ 389 562	$ 391 897	$ 396 096	$ 400 330	
% Increase (Decrease)		1.3%	0.6%	1.1%	1.1%	1.0%
Number of Customers	548 774	555 760	561 825	568 443	575 648	1.2%
Cost per Customer	701	701	698	697	695	
% Increase (Decrease)		0.0%	-0.5%	-0.1%	-0.2%	-0.2%
Manitoba CPI		2.4%	1.8%	1.9%	2.0%	2.0%

Figure 5.5.2 OM&A, Accounting Changes & CPI



As indicated above, Manitoba Hydro has maintained the average annual increase in OM&A costs at 1%, net of accounting changes, which is below inflation of 2.0% as a result of cost containment initiatives which focus primarily on reductions of staff positions. OM&A cost per customer is forecast to decline by an average of 0.2% per year over the 2012/13 to 2016/17 period.

IFF14 reflects the Corporation's commitment to a reduction of approximately 300 operational positions over the 3 year forecast period from 2014/15 to 2016/17 by leveraging attrition opportunities. These reductions will be achieved through the use of technology, consolidation and elimination of work processes where appropriate.

The following figure provides a summary of the committed position reductions by Business Unit.

Figure 5.5.3 Operational Position Reductions

	2014/15	2015/16	2016/17
President & CEO	2	2	2
General Counsel & Corporate Secretary	1	1	1
Human Resources & Corporate Services	33	27	21
Corporate Relations	3	2	1
Finance & Regulatory	4	3	3
Generation Operations	9	12	6
Major Capital Projects	1	1	-
Transmission	30	18	42
Customer Service & Distribution	46	19	13
Customer Care & Energy Conservation	16	6	5
Annual Commitment	**146**	**91**	**91**
Cumulative Commitment	**146**	**237**	**328**

Tab 5, Section 5.14 provides further discussion on some of the key initiatives being deployed by the Corporation in order to effectively manage its costs.

The 1.0% increase in OM&A has been achieved despite significant cost pressures primarily as a result of higher wages and salaries due to contract settlements greater than inflation and the impacts of merit and progression. A fair and competitive wage is necessary for attraction and retention purposes, to recognize the specialized education and training that several occupational groups are required to possess, and it also takes into account the challenging work conditions experienced by many employees in a customer service driven electric and natural gas utility environment (e.g. weather conditions, emergency response, confined spaces, etc).

The following figure outlines the contracted wage settlements in effect over the 5 year period.

Figure 5.5.4 Contracted Wage Settlements

Union	Effective Date	Contracted Wage Settlement
IBEW [1]	April 1, 2012	2.00%
All	January 1, 2013	0.00%
AMHSEE [2]	September 12, 2013	3.00%
All	January 1, 2014	2.75%
All	January 1, 2015	2.75%
Unifor/CEPU/ AMHSEE	January 1, 2016	2.50%

[1] 2% market adjustment for identified trade classifications in IBEW.

[2] 3% market adjustment for identified AMHSEE Trade Supervisors.

In addition to contracted wage settlements, employees are also entitled to receive either merit based on performance or salary progression through the pay schedules assigned to job classifications. Merit and progression combined with contracted wage settlements has resulted in an overall wage increase of 3 to 4% annually.

2.0 OM&A FORECAST PROCESS

Manitoba Hydro establishes an overall forecast for its OM&A expenses by taking into consideration the following factors:

- Costs of providing ongoing services;
- Special or non-recurring maintenance projects;
- Current and expected economic conditions;
- Changing business requirements; and
- Accounting changes and other significant items.

The overall forecast is apportioned to each of the business units and to the electric and gas operations based on current staffing levels, cost requirements that consider specific business, economic and other factors, and the implementation of cost containment initiatives. The Vice-President in charge of each business unit oversees the approved operating expenditures among the programs, division and utility operations for which they are responsible. Detailed departmental budgets support the approved business unit budgets.

The operating forecasts and detailed budgets form the basis for the OM&A forecast included in the Integrated Financial Forecast, which is presented to the MHEB for approval on an annual basis.

3.0 ACCOUNTING CHANGES IMPACTING OM&A EXPENDITURES

Although changes in accounting practices and policies have had a significant impact on the Corporation's OM&A expenditures, they are offset by reduced depreciation and amortization minimizing the overall impact to financial results and revenue requirement; see Appendix 5.6 for further information. Changes impacting OM&A are primarily a result of the planned implementation of IFRS in 2015/16 including related changes in prior years to support the transition.

Capitalization of Overhead Costs

Since 2009/10 Manitoba Hydro has removed approximately $62 million from its overhead capitalized under CGAAP in order to align the Corporation's capitalization policies with those of other Canadian utilities. Items removed from overhead capitalized include interest on equipment and facilities, building depreciation and operating costs, IT infrastructure and related support, as well as various corporate department costs. Manitoba Hydro has also reduced the capitalization of intangible asset costs.

With the implementation of IFRS in 2015/16, overhead capitalized will be reduced by a further $55 million reflecting the removal of training, service area costs, administrative & clerical support and divisional and department management costs which are no longer eligible for capitalization.

Pension & Benefits

In 2011/12, it was necessary for Manitoba Hydro to reduce its discount rate for the valuation of its pension and benefit obligations reflecting industry trends to calculate rates in accordance with recent guidance from the Canadian Institute of Actuaries and lower interest rates in general.

Further changes in 2015/16 under IFRS include the elimination of the amortization of past service costs and actuarial gains and losses as well and transitional adjustments related to pension and benefits.

The figure below provides a summary of the accounting and benefit changes impacting OM&A by fiscal year:

Figure 5.5.5 Summary of Accounting & Benefit Changes

SUMMARY OF ACCOUNTING & BENEFIT CHANGES - ELECTRIC OPERATIONS
(in thousands of dollars)

Total OM&A Impact	$ 78,345	$ 91,155	$ 93,858	$ 145,644	$ 151,345

4.0 STAFFING REQUIREMENTS TO MANAGE OPERATIONS & CAPITAL INVESTMENT

Manitoba Hydro hires permanent, term, and temporary staff to manage, operate, maintain and construct the Corporation's assets and to provide service to customers. An Equivalent Full Time ("EFT") position represents a full time employee.

Manitoba Hydro has classified its EFTs into three categories in order to provide an analysis of the deployment of resources between operations and construction given Manitoba Hydro is entering a period of extensive capital investment and reinvestment.

1) Capital Construction EFTs – staff who charge their time to capital projects approved within the Capital Expenditure Forecast (CEF). The hours charged must be incremental, non-discretionary and directly attributable in order to be eligible for capitalization.

2) Operations and Maintenance EFTs – staff who charge time to operating and maintaining the electric, gas and various infrastructure assets of the corporation.

3) Governance, Support & Services EFTs:
   i. Governance – staff that provide direction and oversight regarding the actions, policies and decisions of the Corporation. This category includes functions such as internal audit, legal and executive.
   ii. Support Services - staff that provide corporate and divisional support services such as human resources, information systems, division and department managers, as well as departmental support activities not directly allocated to the capital construction or operations and maintenance functions of the corporation.

The following table and graph display EFTs for each category over the 5 year period:

Figure 5.5.6 Straight Time & Overtime EFTs

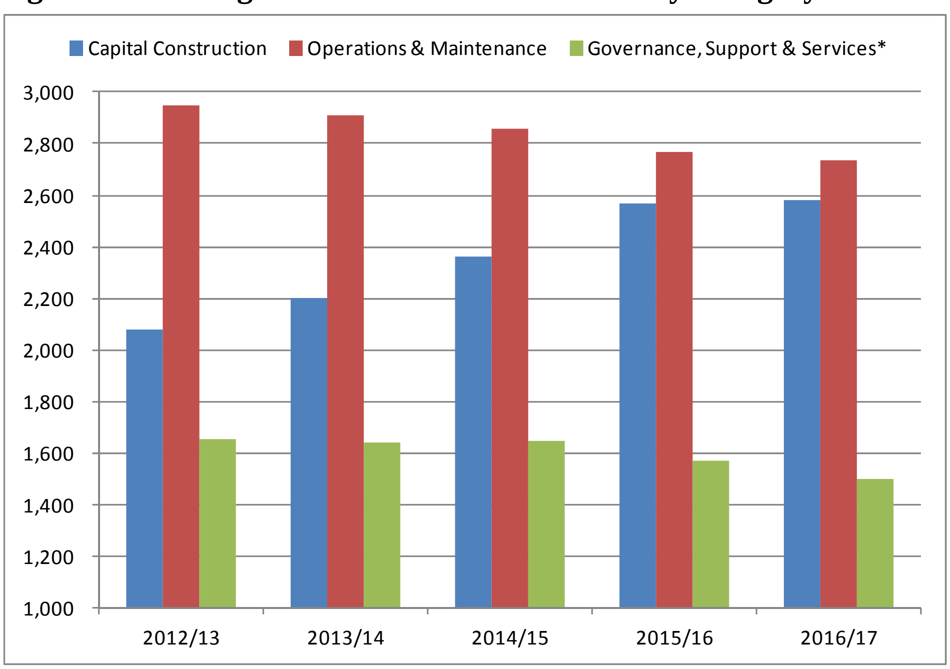
MANITOBA HYDRO
TOTAL EQUIVALENT FULL TIME (EFT) EMPLOYEES

(Straight Time & Overtime Combined)	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast	Average Annual % Inc/(Dec)
Capital Construction	2 081	2 204	2 362	2 568	2 580	**5.6%**
Operations & Maintenance	2 946	2 908	2 855	2 765	2 733	**-1.9%**
Governance, Support & Services*	1 651	1 644	1 647	1 569	1 501	**-2.3%**
Total Corporation	**6 678**	**6 756**	**6 864**	**6 902**	**6 814**	**0.5%**

	Straight Time EFTs			Overtime EFTs		
	2012/13 Actual	2016/17 Forecast	Increase/ (Decrease)	2012/13 Actual	2016/17 Forecast	Increase/ (Decrease)
Capital Construction	1 942	2 357	415	139	223	84
Operations & Maintenance	2 768	2 575	(193)	178	158	(20)
Governance, Support & Services*	1 586	1 449	(137)	65	52	(13)
Total	**6 296**	**6 381**	**85**	**382**	**433**	**51**

*Note: A portion of Governance, Support & Services EFTs are capitalized through overhead

Figure 5.5.7 Straight-time and Over-time EFTs by Category



As depicted above, the average annual growth in EFTs for the 5 year period is 0.5%. During this period of significant capital investment, EFTs associated with capital construction are increasing. In contrast, consistent with Manitoba Hydro's commitment to manage its operating costs, the number of EFTs associated with operations & maintenance and governance & support activities are forecast to decline.

The decline in Operations and Maintenance EFTs and Governance, Support and Services EFTs is as a result of a comprehensive review of all positions to support cost containment efforts as well as a shift in some staff from operations to capital construction. The primary focus of the position review is to analyze work processes and functions and identify opportunities for elimination, consolidation or the use of technology that will result in staff reductions and efficiencies. Some of the specific initiatives in progress which result in reductions include:

- Consolidation of rural district offices;
- Implementation of efficiencies gained as a result of new technologies such as Mobile Workforce Management (MWM);
- Organizational realignments; and
- Review and alignment of trainee and summer student levels.

See Tab 5, Section 5.14 for further details on cost containment initiatives.

The figures below display straight time and overtime EFTs for each Business Unit, by category. Straight time and overtime EFT levels are influenced by different business requirements and explanations for significant changes over the 5 year period are provided below.

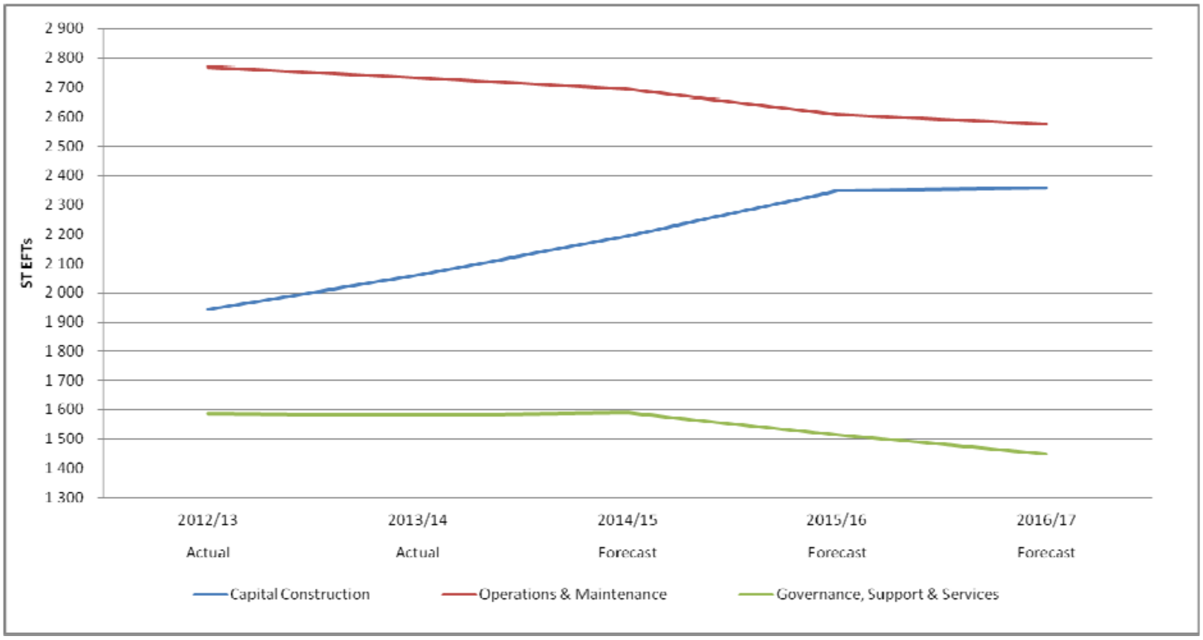
Figure 5.5.9 Straight Time EFTs by Category



The following provides explanations for Business Units where straight time EFTs that have significantly increased or decreased as shown in Figure 5.4.8:

1) The decrease in EFTs in the President & CEO Business Unit is primarily due to reorganizations which resulted in the transfer of EFTs to Human Resources & Corporate Services, General Counsel & Corporate Secretary and Corporate Relations.

2) The decrease in EFTs in the Human Resources and Corporate Services Business Unit primarily relates to the elimination of various positions throughout the area primarily through outsourcing, implementing efficiencies gained from new technologies and realignment of duties.

3) The increase in EFTs in the Major Capital Projects Business Unit primarily relates to additional resource requirements for major new generation and transmission projects such as the Keeyask Generating Station, Bipole III, and Pointe Du Bois Spillway Replacement, partly offset by the Wuskwatim Generating Station becoming operational in 2013/14.

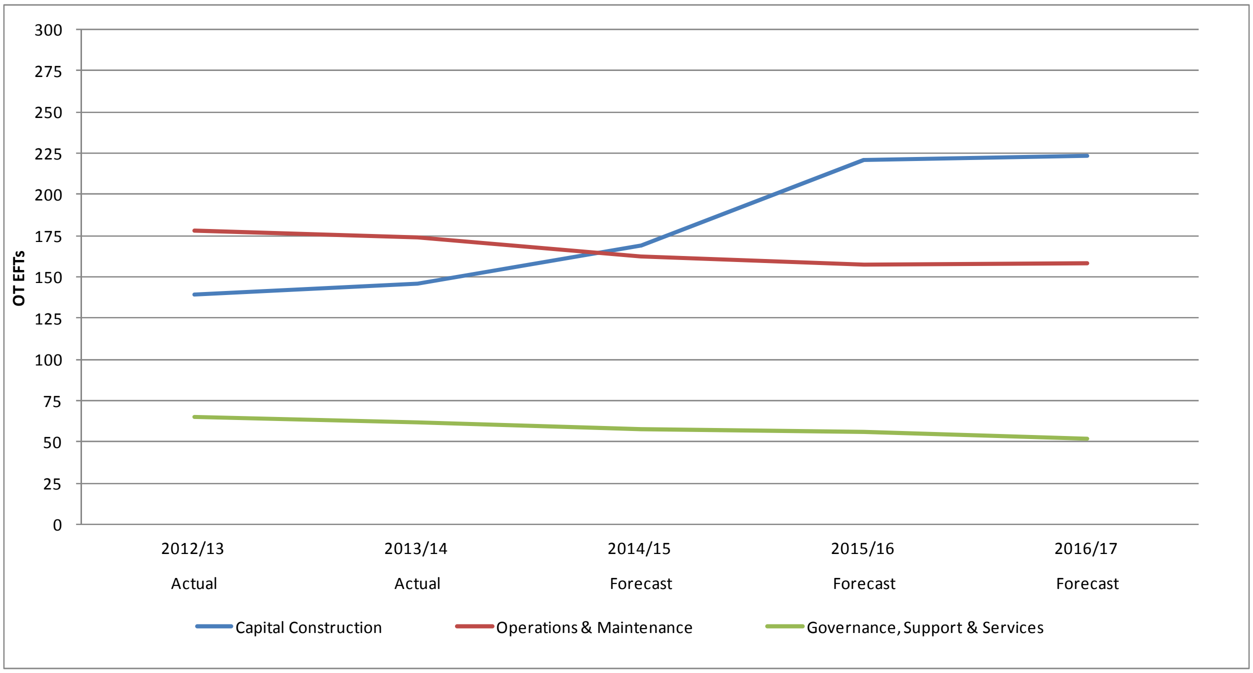
Figure 5.5.11 Overtime EFTs by Category



The following provides explanations for Business Units where overtime EFTs have significantly increased or decreased as shown in Figure 5.4.10:

1) The decrease in EFTs in the Generation Operations Business Unit in the forecast years is primarily due to elevated maintenance requirements in 2013/14 at various generating stations as well as emergency work related to the fire at the Jenpeg Generating Station. In addition, further reductions are reflected in the forecast period as a result of cost containment strategies such as automation of the Pointe du Bois Spillway.

2) The increase in overtime EFTs in the Major Capital Projects Business Unit is related to requirements to protect key in-service dates primarily for the Keeyask Generating Station, Bipole III and the Pointe du Bois Spillway Replacement.

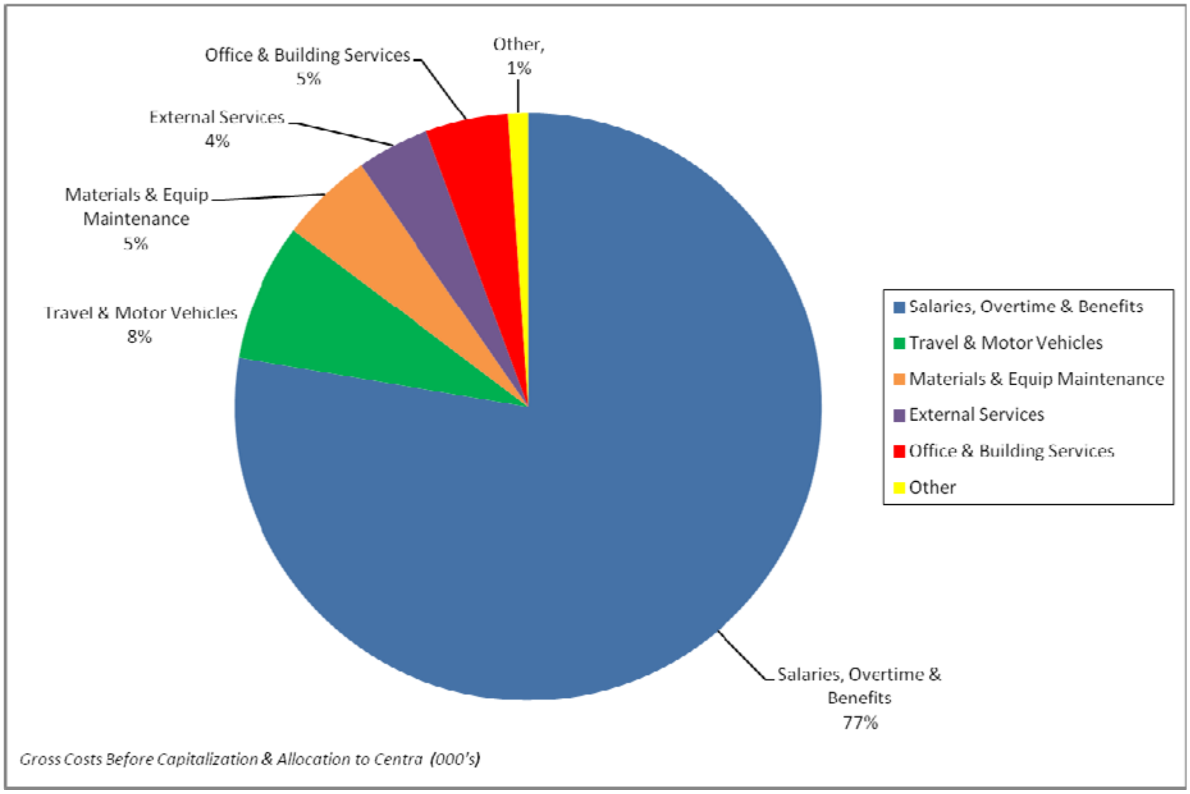
3) The decrease in overtime EFTs in the Customer Service & Distribution Business Unit is primarily related to unplanned storm restoration work and the completion of the Mobile Workforce Management capital project in 2012/13.

5.0 ANALYSIS OF COSTS BY CATEGORY INCLUDING OPERATING/CAPITAL ALLOCATION

Costs incurred by the Corporation are categorized as cost elements which describe the type of expenditure, such as wages & salaries, benefits, travel, materials, consulting, etc.

The following chart provides a graphical depiction of the major cost element components for 2013/14 actual expenditures excluding capitalization impacts and allocation of costs to Centra Gas.

Figure 5.5.12 OM&A by Category 2013/14



The following table provides a summary of Manitoba Hydro's actual and forecast costs by cost element over the 5 year period:

*Includes amounts capitalized through Overhead

Figure 5.4.13 above includes costs which are direct charged to the operations and maintenance activities of the Corporation (e.g. materials, contracted services, consulting, etc) as well as staff related costs, of which a portion is allocated to capital. Staff related costs, such as wages & salaries, benefits, travel, and motor vehicles, are costs associated with providing a pool of resources required for the operation, maintenance and capital construction activities of the Corporation. These costs are allocated to both capital projects and operating programs through the use of an hourly activity rate charged through the corporate time allocation system. Activity rates are calculated for work groups that perform a common set of functions.

In addition, under CGAAP a portion of costs (e.g. wages and salaries, benefits, office and administration, etc.) associated with corporate services and departmental support functions are also capitalized through an overhead rate. Under IFRS, only costs associated with the purchasing and accounts payable functions remain eligible for capitalization.

The figures below provide an analysis of the labour and benefit costs charged to capital and operations as a percentage of the total:

Figure 5.5.14 Labour & Benefits Charged Capital & Operations

MANITOBA HYDRO
LABOUR & BENEFITS CHARGED TO CAPITAL AND OPERATIONS

(In thousands of $)	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast
Total Labour & Benefits	$ 658,082	$ 699,970	$ 724,993	$ 751,523	$ 766,109

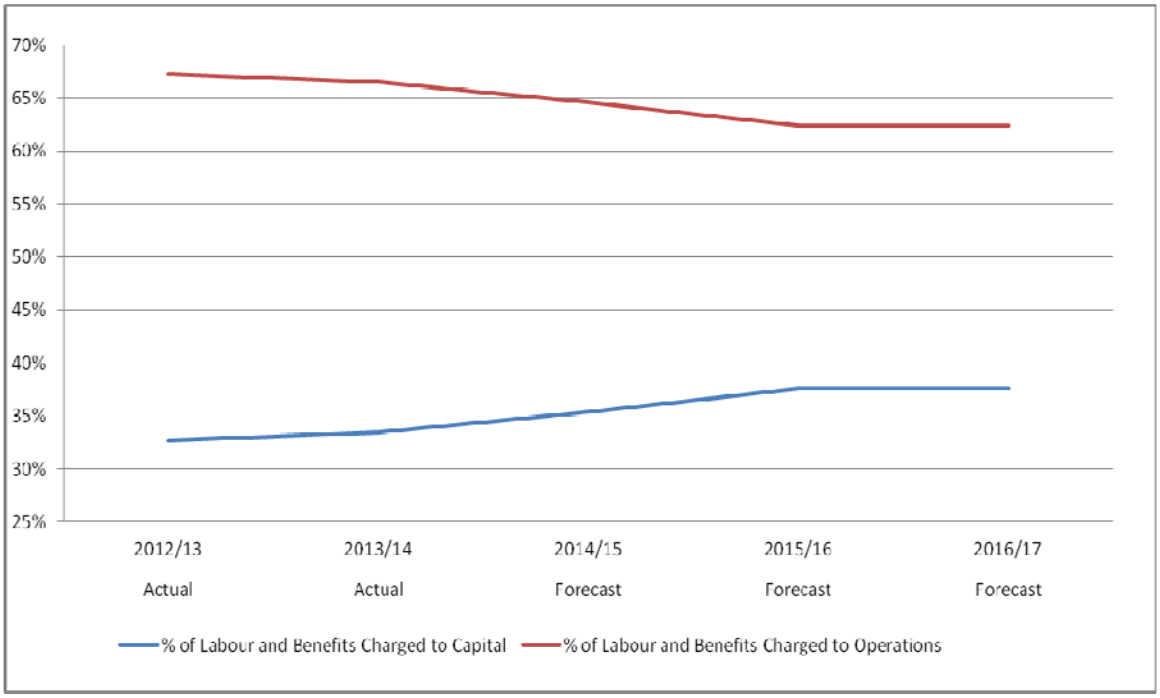
Percentage of Labour and Benefits Charged to Capital	**33%**	**34%**	**35%**	**38%**	**38%**
Labour & Benefits Charged to Operations	442,591	465,460	468,405	469,188	478,140
Percentage of Labour and Benefits Charged to Operations	**67%**	**66%**	**65%**	**62%**	**62%**

Figure 5.5.15 Labour & Benefits Charged Capital & Operations %



As demonstrated, there is a steady growth in the capitalized component of the labor and benefit costs, ranging from 33% in 2012/13 to 38% in both 2015/16 and 2016/17. The increase of labor and expense capitalized in the forecast years reflects the growth in Manitoba Hydro's capital construction program required for Bipole III, Keeyask Generating Station, U.S. Transmission Interconnection, higher DSM requirements and increased investment in aging infrastructure. This growth is necessary to ensure the Corporation can continue to provide safe and reliable service.

The following provides explanations for cost elements that have significantly increased or decreased over the five year period as shown in Figure 5.4.13:

1) Wages & Salaries increased by an average of 3.5% primarily as a result of contract settlements with bargaining units and increases in numbers of equivalent full time employees (EFTs) primarily to support the growth in Manitoba Hydro's capital program. See section 4.0 Staffing Requirements to Manage Operations & Capital Investment.

2) Overtime increased by an average of 4.8% primarily as a result of protecting key in-service dates for capital projects such as Bipole III and the Keeyask Generating Station as well as increased costs due to the impact of union contract settlements.

3) Employee Benefits increased by an average of 5.3% primarily due to the decrease in the discount rate at the end of 2012/13 resulting in a significant experience loss on the pension liability resulting in increased amortization costs for 2013/14 and 2014/15 and an increase in the current service rate for 2013/14. IFRS changes, beginning in 2015/16, show a reduction of costs as the amortization of past service costs and actuarial gains and losses is eliminated and transitional adjustments related to pension and benefits are incorporated.

4) Labour & Benefits Charged to Capital increased by an average of 7.6% as the corporation commences construction of new generation & transmission projects such as Bipole III and Keeyask Generating Station, and addresses increased requirements for DSM programs, new customer connections, and aging infrastructure. In addition, contract negotiations with bargaining units and increased benefit costs have contributed to higher capitalized labor and expense costs.

5) Labour & Benefits and Other Costs Charged to Operations increased by an average of 2%, which is in line with inflation.

6) Employee Training & Safety increased by an average of 3.9% which reflects greater training costs related to I.T. development for projects such as Enterprise Asset Management (EAM) and new equipment training as well as greater fire retardant clothing requirements.

7) Consulting & Professional Fees increased by an average of 4.6% primarily related to new bio-physical monitoring costs incurred with the Wuskwatim Generating Station going into service in 2012/13.

8) Construction & Maintenance Services increased by an average of 3.6% due to a greater focus on the vegetation management program beginning in 2013/14 and higher external costs anticipated for generation maintenance activities. In addition, there is an increased requirement for brush clearing in 2014/15 which is reduced in 2015/16 as a result of a redeployment of those resources to focus on widening of right-of-ways primarily for Bipole III beginning in 2015/16.

9) Equipment Maintenance & Rentals increased by an average of 2.5% due to I.T. system implementations and rising costs of hardware and software maintenance contracts.

10) Customer & Public Relations decreased by an average of 5.5% as a result of lower corporate donations due to cost saving measures.

11) Office & Administration increased by an average of 3.2% as a result of rising postage costs and increased telecommunication costs to support the implementation of Mobile Workforce Management.

12) Miscellaneous Expense decreased by an average of 17.2% due to the expensing of capital project costs that were cancelled in 2012/13 and 2013/14, as well as lower forecasted radio license fees due to using fibre optic systems.

13) Operating Expense Recovery had no significant change overall in the 5 year period; however 2013/14 included a recovery of costs for the restoration work performed after the TCPL explosion and the assistance provided to Toronto Hydro after the December 2013 storm.

14) Strategic Initiative Funding was incorporated into IFF14 to provide funding for corporate programs outside of regular business unit operations that support corporate priorities. The Supply Chain Management Initiatives that are outlined in Section 5.14 of Tab 5 is an example of a corporate initiative for which funding has been provided.

15) Other Costs Charged to Capital increased by an average of 4.4% as the Corporation commences construction of new generation & transmission projects such as Bipole III and the Keeyask Generating Station, and addresses increased requirements for DSM programs, new customer connections, and aging infrastructure.

16) Capitalized Overhead decreased by 13.2% primarily in 2015/16 as a result of the transition to IFRS which does not allow for capitalization of training, service area costs, administrative & clerical support and divisional and department management costs.

6.0 ANALYSIS OF COSTS BY ORGANIZATONAL BUSINESS UNIT

Manitoba Hydro's organizational structure consists of 10 Business Units:

- President & CEO
- General Counsel & Corporate Secretary
- Human Resources & Corporate Services
- Corporate Relations
- Finance & Regulatory
- Generation Operations
- Major Capital Projects
- Transmission
- Customer Service & Distribution
- Customer Care & Energy Conservation

Each Business Unit is comprised of Divisions, Departments, and Cost Centres whose roles integrate to achieve the overall corporate strategic direction. These Business Units are accountable for their respective business objectives and operations and are the basis for developing detailed organization and staffing plans.

The following figure displays the organizational view of OM&A over the 5 year period:

Figure 5.5.16 OM&A by Business Unit

MANITOBA HYDRO
OPERATING, MAINTENANCE AND ADMINISTRATIVE COSTS BY BUSINESS UNIT

(In thousands of $)	2012/13 Actual	2013/14 Actual	2014/15 Forecast	2015/16 Forecast	2016/17 Forecast	Average Annual % Inc/(Dec)
President & CEO	$ 12,648	$ 10,887	$ 12,309	$ 12,469	$ 12,460	0.1%
General Counsel & Corporate Secretary	8,741	9,316	9,244	9,222	9,232	1.4%
Human Resources & Corporate Services	94,161	106,036	108,058	108,161	107,814	3.6%
Corporate Relations	9,730	8,918	10,059	10,008	10,033	1.0%
Finance & Regulatory	17,480	18,510	20,033	20,104	20,182	3.7%
Generation Operations	125,533	135,373	138,290	141,178	142,959	3.3%
Major Capital Projects	2,912	4,384	5,638	4,568	4,588	15.1%
Transmission	156,442	163,910	164,112	165,338	165,995	1.5%
Customer Service & Distribution	132,330	130,902	134,922	132,275	133,490	0.2%
Customer Care & Energy Conservation	49,624	55,353	58,361	56,364	56,837	3.6%
Business Unit	**$ 609,602**	**$ 643,590**	**$ 661,027**	**$ 659,687**	**$ 663,591**	**2.2%**

The average annual increase for the Business Units for the 5 year period remains close to the level of inflation (2.2%). All Business Units experienced cost increases in 2013/14 as a result of higher benefit costs primarily related to a change in the discount rate. In addition, all years reflect contract settlements with bargaining units which exceed the rate of inflation. These cost increases have been offset by various cost containment initiatives.

The Major Capital Projects Business Unit was formed in the fall of 2013 to centralize and establish a coordinated single point of contact for all major construction projects. The Business Unit is currently focused on the project management and construction of the Keeyask Generating Station, Bipole III, and Pointe du Bois Spillway Replacement, in addition to some smaller projects. In addition to benefit increases and contract settlements, the Major Capital Projects Business Unit's OM&A costs increased by an average of 15.1% primarily in 2013/14 and 2014/15 as a result administrative costs related to the creation of the new business unit that are no longer eligible for capitalization. In addition, temporary implementation costs related to the in-service of the Wuskwatim Generating Station occurred during these years but are no longer required in the forecast years.

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

DEPRECIATION RATES & DEPRECIATION STUDY

1.0 OVERVIEW

Depreciation expense is recognized on a straight-line basis over the estimated average remaining service life of assets, based upon depreciation studies conducted approximately every 5 years by the Corporation. Manitoba Hydro conducted a depreciation study in 2010 where new depreciation component groups were developed in anticipation of its transition to IFRS. Most recently, Manitoba Hydro completed a new study in October 2014 to develop Canadian GAAP (fiscal 2014/15) and IFRS compliant (fiscal 2015/16) depreciation rates. The following schedule provides a summary of the estimated changes to depreciation expense for the Electric Operations for fiscal 2014/15 (Canadian GAAP) and for the test years under IFRS, fiscal 2015/16 and 2016/17:

Figure 5.7.1 Depreciation Expense

	Depreciation Expense ($ millions)		
	2014/15	**2015/16**	**2016/17**
Change in service life - PP&E (net of contributions)	**(25)**	**(29)**	**(30)**
Overhead Ineligible for Capitalization			**(2)**
Elimination of Provision for Asset Removal	–	**(60)**	**(63)**
Change in Methodology (ELG)	–	**36**	**38**
Net Impact on Depreciation Expense Increase (Decrease)	**(25)**	**(53)**	**(57)**

As with previous depreciation studies, an external consultant, Gannett Fleming Canada ULC, was engaged to review Manitoba Hydro's current depreciation practices, to provide advice on any changes necessary for compliance with IFRS, and to develop depreciation rates. Gannett Fleming performed an analysis of plant asset addition and retirement activity, as well as a peer review and discussions with operational and engineering staff to identify internal and external factors that impact the average useful service life and depreciation curve for each depreciable component. Please see the 2014 Depreciation Study for information about the scope, basis and methods used in this study.

The 2014 depreciation study is based on depreciable assets in service as of March 31, 2014. Manitoba Hydro has implement revised Canadian GAAP depreciation rates effective April 1, 2014 for fiscal 2014/15 and will implement IFRS compliant depreciation rates effective April 1, 2015 for fiscal 2015/16. The IFRS compliant depreciation rates will include the elimination of the provision for asset removal from depreciation rates as well as a change in the depreciation methodology to the Equal Life Group method.

The schedules provided on pages 6 – 13 of this Appendix provide a comparison of Manitoba Hydro's Canadian GAAP (CGAAP) depreciation rates (as determined in the 2010 depreciation study) to updated CGAAP and IFRS compliant depreciation rates. These schedules are followed by a letter from Gannett Fleming containing the depreciation rates to be used under CGAAP for 2014/15 and a report containing the depreciation rates to be used under IFRS for 2015/16. The significant changes in the 2014 depreciation study are discussed in the sections below.

2.0 REDUCTION IN DEPRECIATION UNDER CANADIAN GAAP (2014/15)

The $25 million annual reduction in depreciation expense under CGAAP for fiscal 2014/15 is the result of extensions to the service lives of select components, further reallocations of historical costs between existing and new component groups and reductions in the 2010 depreciation deficit balances for various components. Similar to the 2010 depreciation study, the results of the 2014 depreciation study reflect the findings of subject matter experts from Manitoba Hydro's operational areas who provided asset condition information based on recent year's condition assessment activities.

In general, Manitoba Hydro's continuous maintenance programs in combination with the Province's advantageous climatic conditions (eg. fewer freeze-thaw occurrences) have extended the service lives of many of its infrastructure-type assets longer than initially estimated. This is reflected in several depreciation rate decreases in the study.

Approximately $11 million of the $25 million overall reduction in depreciation expense pertains to an increase in the service lives for various assets in the Distribution, Communication, Motor Vehicle and Computer Software & Development components including: Overhead Serialized Equipment (35 to 45 years), Carrier Equipment (15 to 20 years), Heavy Trucks (15 to 19 years), and Operational System Major Software EMS/SCADA (6 to 7 years).

The remainder of the $25 million decrease in annual depreciation expense is primarily the net result of the following:

- Approximately $10 million of the reduction is the result of the re-allocation of historical costs within the HVDC asset components from assets with shorter service lives to assets with longer service lives. This re-allocation is the result of ongoing efforts by the Corporation to examine the records of certain assets so as to re-allocate costs amongst new and existing asset components;

- A further reduction of $5 million is the result of the drawdown of provisions built into 2010/11 depreciation rates for accumulated depreciation deficit balances that existed at the time of the 2010 depreciation study;
- These reductions are partially offset by a $6 million increase in the annual depreciation for the Hydraulic Generation component group as a result of shortening the amortization period on the asset retirement obligation for the decommissioning of the Point du Bois Spillway. The 2017 original retirement date of the spillway has been moved forward to 2015.

It should be noted that although Manitoba Hydro has been able to extend the service lives of many of its infrastructure type assets, many of these assets are nearing the end of their useful life. As such, the rate of installation of replacement assets will need to increase over the next 20 years so as to sustain existing levels of safety and reliability. Depreciation rate forecasts based on the 2014 study assume that Manitoba Hydro will continue to provide maintenance programs so as to achieve similar service lives from the replacement assets.

3.0 REDUCTION IN DEPRECIATION UNDER IFRS (2015/16 & 2016/17)

Upon its transition to IFRS effective April 1, 2015, Manitoba Hydro will eliminate negative salvage from depreciation rates in order to manage the overall impacts of IFRS to a net reduction to revenue requirement. Manitoba Hydro currently uses the ASL method under CGAAP, but will be changing to the ELG method upon transition to IFRS in order to be compliant with the financial reporting requirements. The net effect of Manitoba Hydro implementing these changes is a $24 million and $25 million reduction in annual depreciation expense in fiscal years 2015/16 and 2016/17, respectively. The break-down of the impact of these changes by asset category are presented in the following table:

Figure 5.7.2 Depreciation Expense

Depreciation (in millions of dollars)	2015-16 (IFRS)			2016-17 (IFRS)		
Electric Assets:	Provision for Asset Removal	Change to ELG	2015-16 IFRS Net Impact	Provision for Asset Removal	Change to ELG	2016-17 IFRS Net Impact
Generation	$ (13)	$ 8	$ (5)	$ (14)	$ 9	$ (5)

Net increase (decrease) in revenue requirement	**$ (60)**	**$ 36**	**$ (24)**	**$ (63)**	**$ 38**	**$ (25)**

3.1 Eliminate Provision for Asset Removal Costs

Manitoba Hydro currently includes a provision in depreciation rates for asset removal costs. This is a regulatory practice applied under CGAAP by numerous Canadian Utilities. IFRS does not permit the practice of including a provision for the future removal costs of assets in deprecation unless there is a legal or constructive obligation to remove such assets. With the issuance of IFRS 14 *Regulatory Deferral Accounts*, Manitoba could continue to recognize this provision in depreciation rates as a regulatory deferral account. However, Manitoba Hydro has chosen to eliminate this practice upon its transition to IFRS in order to mitigate the impacts of other accounting changes to a net reduction in revenue requirement.

This is consistent with the findings of the PUB as outlined on page 18 of Order 43/13 (April 26, 2013):

> *"The Board accepts Manitoba Hydro's position that net salvage should be removed from depreciation rates when International Financial reporting Standards are implemented rather than during the test years"*

The estimated impact of this change for Manitoba Hydro's electric operations, as presented in Figure 5.7.2 is a decrease to depreciation expense of $60 and $63 million in fiscal 2015/16 and 2016/17, respectively.

3.2 Change to the ELG Method

IFRS is more specific than CGGAP regarding depreciation. Under IFRS, it is mandatory that items of material cost whose service life is different than other items in the group, be amortized separately. Effectively, if the separate depreciation of an item would have a material impact on net income, that item should be depreciated separately. This requirement is not mandatory under CGAAP.

The ELG method calculates depreciation with consideration of the different expected service lives for each of the assets within a group. Every significant asset in the class is depreciated over its own expected service life and is therefore expected to be fully depreciated (not over or under depreciated) when removed from service. This will result in an increase in depreciation expense of $36 million in 2015/16 and $38 million in 2016/17 as presented in figure 5.7.2.

The following provides the schedule of depreciation rates for Electric operations, under ASL and ELG depreciation methods.

Gannett Fleming

Excellence Delivered ***As Promised***

January 14, 2015

Manitoba Hydro
360 Portage Avenue
Winnipeg, Manitoba
T3C 0G8

Attention: Mr. Darren Rainkie
Vice-President, Finance and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have calculated depreciation rates based on your original cost as of March 31, 2014 using the depreciation calculation procedures that were approved in your last depreciation study, namely the use of the Average Service Life (”ASL”) procedure and incorporation of estimated net salvage percentages. The attached schedules provide a summary of the depreciation rates related to the electric generation, transmission, substation, distribution and general plant assets of Manitoba Hydro and the Wuskwatim Power Limited Partnership as of March 31, 2014.

The calculated annual depreciation accrual rates presented in the report are applicable to plant in service as of March 31, 2014. The depreciation rates are based on the average service life estimates and interim survivor curve determinations as recently completed in the full depreciation study report. The net salvage percentages used in the enclosed schedules of depreciation rates are consistent with the percentages used in the 2010 Depreciation Study.

Gannett Fleming has calculated and is providing these requested schedules of depreciation rates in order to provide continuity from the last depreciation study, through the transition to the depreciation rates as provided in the recently completed Gannett Fleming Depreciation Study report.

* The account has no balance as of March 31, 2014 and rate will be used on a go-forward basis for future additions.
** On amortized accounts any true-up of less than 10% is not considered significant.
*** Community Development costs are amortized over the weighted average life of the physical assets deriving benefit from such expenditures.
**** True-up excluded as exisiting assets in account are fully depreciated.

* The account has no balance as of March 31, 2014 and rate will be used on a go-forward basis for future additions.
** On amortized accounts any true-up of less than 10% is not considered significant.
*** Community Development costs are amortized over the weighted average life of the physical assets deriving benefit from such expenditures.
**** True-up excluded as exisiting assets in account are fully depreciated.

Attention: Mr. Darren Rainkie
Vice-President, Finance and Regulatory

Ladies and Gentlemen:

Pursuant to your request, we have conducted a depreciation study related to the electric generation, transmission, substation, distribution and general plant systems of Manitoba Hydro and the Wuskwatim Power Limited Partnership as of March 31, 2014. Our report presents a description of the methods used in the estimation of depreciation, the statistical analyses of service life and the summary and detailed tabulations of annual and accrued depreciation.

The calculated annual depreciation accrual rates presented in the report are applicable to plant in service as of March 31, 2014. The depreciation rates are based on the straight-line method, equal life group procedure applied on a whole life basis, with any accumulated depreciation variances amortized over the estimated remaining life of the assets.

Respectfully submitted,

GANNETT FLEMING CANADA ULC

LARRY E. KENNEDY
Vice President

TABLE OF CONTENTS, Cont'd.

MANITOBA HYDRO
2014 DEPRECIATION STUDY

EXECUTIVE SUMMARY

Pursuant to Manitoba Hydro's ("Company") request, Gannett Fleming Canada ULC ("Gannett Fleming") conducted a depreciation study related to the generation, transmission, substation, distribution and general plant accounts as of March 31, 2014. The purpose of this study was to determine the annual depreciation accrual rates and amounts for book and ratemaking objectives.

The depreciation rates are based on the straight line method using the equal life group ("ELG") procedure and were applied on a whole life basis based on attained ages and estimated average service lives. The depreciation calculations provided herein do not include any provision for cost of removal. Variances between the calculated accrued depreciation and the book accumulated depreciation as of March 31, 2014 are amortized over the remaining life of assets.

As discussed in the last review of depreciation rates, the use of the ELG procedure and the removal of net negative salvage from the depreciation rate calculations are consistent with Manitoba Hydro's planned implementation of International Financial Reporting Standards ("IFRS").

Gannett Fleming recommends the annual depreciation accrual rates for the electric plant in service as of March 31, 2014 as presented in Tables 1, 1A, 2 and 2A of the study. Supporting data and calculations are also provided under separate cover. These rates are effective for Manitoba Hydro on April 1, 2015 upon its transition to IFRS.

This study results in an annual depreciation expense accrual of $319.2 million when applied to depreciable plant balances as of March 31, 2014. The report study results are summarized at an aggregate functional group level as follows:

SUMMARY OF ORIGINAL COST, ACCRUAL PERCENTAGES AND AMOUNTS

PLANT GROUP	ORIGINAL COST MARCH 31, 2014 $'s	ELG ANNUAL ACCRUAL %'s	ELG ANNUAL ACCRUAL $'s
(1)	(2)	(3)	(4)
GENERATION			
HYDRO	5,445,593,386	1.54	83,954,010
THERMAL	439,575,329	3.44	15,106,757

PART I. INTRODUCTION

MANITOBA HYDRO
DEPRECIATION STUDY
PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Manitoba Hydro, to determine the annual depreciation accrual rates and amounts for book purposes applicable to the original cost of Manitoba Hydro's and the Wuskwatim Power Limited Partnership's electric generation, transmission, substation, distribution and general plant assets as of March 31, 2014. These rates will be effective on April 1, 2015 upon Manitoba Hydro's transition to IFRS. The rates and amounts are based on the straight-line whole life method of depreciation incorporating the ELG procedure with a separate amortization of the variance between the book depreciation reserve and the calculated accrued depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to electric plant in service.

The service life estimates resulting from the study were based on: informed professional engineering judgment which incorporated analyses of historical plant retirement data as recorded through March 31, 2014; a review of Company practice and outlook as they relate to plant operation and retirement; and consideration of current practice in the electric industry, including knowledge of service life estimates used for other electric utilities.

PLAN OF REPORT

Part I. Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II. Development of Depreciation Parameters, presents descriptions of the methods used in the service life studies. Part III. Calculation of Annual and Accrued Depreciation presents the methods and procedures used in the calculation of depreciation. Part IV. Results of Study, presents summaries by depreciable group of annual and accrued depreciation. The Supporting Documents to this study include: Part V. Service Life Statistics, which presents the results of the retirement rate analysis and Part VI. Detailed Depreciation Calculations, which present the detailed tabulations of annual and accrued depreciation. An overview of Iowa curves and the Retirement Rate Analysis are set forth in Appendix A of this report.

BASIS OF THE STUDY

Depreciation

For most accounts, the annual and accrued depreciation were calculated by the straight-line method using the equal life group procedure. For certain General Plant accounts, the annual and accrued depreciation are based on amortization accounting. Both types of calculations were based on original cost, attained ages, and estimates of service lives. Variances between the calculated accrued depreciation or amortization and the book accumulated depreciation are amortized over the composite remaining life of each account.

Continued monitoring and maintenance of the accumulated depreciation reserve at the account level is recommended. Gannett Fleming has determined an amortization amount to true-up the present variance with the calculated accrued depreciation, (“theoretical reserve”), over the composite remaining life of each account. Tables 2 and 2A presented in Part IV of the report sets forth the amortization of the reserve variance at the account level. This adjustment mechanism, whether determined separately as an amortization amount or incorporated in the calculation of remaining life accruals, is widely-accepted. An explanation of the monitoring of the accumulated depreciation reserve and the calculation of the true-up provision is presented beginning on page III-5 of the report.

The straight-line method, equal life group procedure is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America. Gannett Fleming recommends its use given the company’s requirement to comply with IFRS. Amortization accounting is used for certain accounts that contain a large volume of small dollar value assets where the effort required to maintain detailed records is not warranted. Many electric utilities in North America have received approval to adopt amortization accounting for these types of accounts.

Service Life Estimates

The service life estimates used in the depreciation and amortization calculations are based on informed judgment which incorporated a review of management's plans, policies and outlook, a general knowledge of the electric utility industry and comparisons of the service life estimates from our studies of other electric utilities. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for hydroelectric plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the probable future. The combination of the historical experience and the estimated future yielded estimated survivor curves from which the average service lives were derived.

The depreciation rates should be reviewed periodically to reflect the changes that result from plant and reserve account activity. A depreciation reserve deficiency or surplus will develop if future capital activity varies significantly from the assumptions included in this study.

PART II. DEVELOPMENT OF DEPRECIATION PARAMETERS

PART II. DEVELOPMENT OF DEPRECIATION PARAMETERS

DEPRECIATION

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing electric utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight-line method of depreciation.

The calculation of annual and accrued depreciation based on the straight-line method requires the estimation of survivor curves and is described in the following sections of this report. The development of the proposed depreciation rates also requires the selection of group depreciation procedures, as discussed in Part III of this report.

ESTIMATION OF SURVIVOR CURVES

Survivor Curves

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages using the retirement rate method of analysis.

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements in relationship to the average life and relative height of the modes. The left-moded curves are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical-moded curves are those in which the greatest frequency of retirement occurs at average service life. The right-moded curves are those in which the greatest frequency occurs to the right of, or after, the average service life. The origin-moded curves are those in which the greatest frequency of retirement occurs at the origin, or immediately after age 0. The letter designation of each family of curves (L, S, R or O) represents the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family.

A discussion of the general concept of survivor curves and retirement rate method is presented in Appendix A of this report.

Survivor Curve Judgments

The survivor curve estimates were based on judgment which considered a number of factors. The primary factors were the statistical analysis of data; current policies and outlook as determined during conversations with management personnel and on the knowledge Gannett Fleming developed through the completion of numerous electric utility studies.

The following discussion, dealing with a number of accounts which comprise the majority of the investment analyzed, presents an overview of the factors considered by Gannett Fleming in the determination of the average service life estimates. The survivor curve estimates for the remainder of the accounts not discussed in the following sections were based on similar considerations.

Generation Accounts

Gannett Fleming developed unique depreciation rate calculations for each of the hydraulic generation plants in recognition of the estimated specific life spans for each plant. However, the average service life estimates were developed through a retirement rate analysis which was prepared on the basis of a grouping of the plant accounting data at an account level related to the combined databases from all hydraulic generation sites. Therefore, the analyses presented in Section IV of the Supporting Documents and as discussed below, are based on the combined data from all locations for each account.

Hydraulic Accounts

The investment in Manitoba Hydro's hydraulic generation is captured in Account Groups which are individually tracked by geographic site. The plant accounting information for each of the groups is aggregated from the information related to each of the geographic sites to facilitate review and to provide for a statistically relevant population of retirement activity to study. As such, the depreciation rates use a common average service life estimate for each of the account groupings.

Account Grouping 000A – Dams, Dykes and Weirs, represents 10.3% of the hydraulic generation and 3.9% of the depreciable assets studied. The investment in this account relates mainly to the geotechnical components, including both concrete and earthen structures. Company management and operational staff have indicated that these structures were engineered to a high standard in order to provide an increased level of safety and longevity. Additionally, the operational staff view that the environmental conditions to which the investment in this account is exposed, will result in a slower erosion of the physical structures than may be witnessed by other similar Canadian dams. As such, it is expected that the investment in this account would have a longer average life expectation than many of the peer group of Canadian electric generation utilities. Additionally, on a yearly basis, the company makes a significant level of investment on dam safety programs throughout its system.

The retirement rate analysis as presented on pages V-3 through V-5 in the Supporting Documents has reviewed the retirement history from 1923 through 2014.

The currently approved Iowa curve related to these assets is the Iowa 125-R4. Based on the retirement rate analysis and on the expectations of operational staff, Gannett Fleming recommends to retain the current Iowa 125-R4 retirement dispersion curve. With this recommendation, the average service life characteristics of the Dams, Dykes and Weirs account will be matched to the estimated retirement dispersion related to the Powerhouse account.

Account Grouping 000B – Powerhouse, represents 19.2% of the hydraulic generation assets and 7.3% of the depreciable assets studied. The investment in this account relates to the powerhouses and civil buildings, including the structural and concrete components.

With the exception of the Grand Rapids generation site, the hydraulic generation powerhouses are part of the physical concrete dam structure. The Grand Rapids powerhouse is located physically behind the dam in a separate structure. Based on the retirement rate analysis as presented on pages V-7 through V-9 in the Supporting Documents and on the expectations of operational staff, Gannett Fleming recommends the continued use of the Iowa 125-R4 for the civil assets related to the hydraulic assets.

Account Grouping 000D – Spillway, represents 7.1% of the hydraulic generation assets and 2.7% of the depreciable assets studied. The typical average service lives for spillways within the Canadian electric generation industry range from 60 to 100 years. Since the last study this account has continued the trend of minimal retirement experience as indicated in the retirement rate analysis presented on pages V-11 through V-13 of the Supporting Documents. Based on the continued trend of limited retirement experience and the affirmation of operational staff, Gannett Fleming recommends an extension of the average service life estimate for this account to an Iowa 80-R3 curve.

Account Grouping 000E – Water Control Systems, represents 6.1% of the hydraulic generation assets and 2.3% of the depreciated assets studied. The investment in this account includes the investment related to gates, guides and hoists. These types of assets are subjected to wear and tear and will require replacement over the life of the generation plant.

Interviews with company operational staff have indicated an expectation of a 65-year life, which would represent a 15-year extension to the currently approved 50-year life. Based on the retirement rate analysis as presented on pages V-15 through V-17 of the Supporting Documents, Gannett Fleming agrees that a life extension is warranted. While the retirement rate analysis may suggest that a life extension of more than 15 years is warranted, the comments of the operational staff indicated a life of 65 years. It is also noted that a 15-year average service life extension represents a 30% increase. Based on the results of the retirement rate analysis and on the expectations of operational staff, Gannett Fleming recommends the use of a 65-year average service life estimate and a change in the mode of the Iowa curve from S4 to R4, resulting in a recommended Iowa 65-R4 curve.

<u>Account Grouping 000G – Turbines and Generators</u>, represents 21.2% of the hydraulic generation assets and 8.1% of the depreciable assets studied. The investment in this account relates to the turbines and generator equipment. The assets in this account were previously depreciated using the Iowa 65-R3 curve. Over the period since the last depreciation study $14.4 million of retirement activity has occurred. The average service life estimates for a Canadian peer group reviewed as part of this study indicated a range of approved average service life estimates ranging from 50 through 75 years. Based on the retirement rate analysis as presented on pages V-23 through V-25 of the Supporting Documents, Gannett Fleming recommends shortening the average service life estimate from the Iowa 65-R3 to the Iowa 60-S3, which is consistent with the historic retirement patterns and remains in the range of average service life estimates of the Canadian peer group.

<u>Account Grouping 000P – A/C Electrical Power Systems</u>, represents 6.4% of the hydraulic generation assets and 2.4% of the depreciable assets studied. The investment in this account relates to the station electric transformer and station service. The assets in this account were previously depreciated using the Iowa 50-R3 curve. Over the period since the last depreciation study, this account has witnessed over $3.7 million of retirement activity. Based on the retirement rate analysis as presented on pages V-30 through V-32 of the Supporting Documents, an extension to the average service life is recommended. Additionally, the expectations of operational staff confirm

that the Iowa 50-R3 is no longer appropriate. As such, Gannett Fleming recommends the use of the Iowa 55-R4, as shown on page V-29 of the Supporting Documents.

Thermal Accounts

Investment in thermal generation is identified by Accounts 1205B through 1215W. These thermal generation units are located in the Brandon area (two natural gas-fired units; one coal-fired unit) and on the east side of the Town of Selkirk (two natural gas-fired units).

Account Grouping – 1200B – Powerhouse, represents 7.6% of the Thermal assets and less than 0.2% of the depreciable assets studied. The thermal generation powerhouses are more typical of industrial concrete or steel buildings. As such, it is estimated that the average service life associated with powerhouse buildings related to thermal plant locations would have a shorter average service life in contrast to those estimates for the hydraulic generation sites.

The statistical analysis indicates a life of approximately 75 years. Manitoba Hydro operational staff confirm the life expectation of 75 years. Based on the retirement rate analysis as presented on pages V-53 and V-54 of the Supporting Documents and on the expectations of operational staff, Gannett Fleming recommends an extension to the Iowa curve estimates of this account from the 65-R4 to an Iowa 75-R5.

Account Grouping – 1200G – Turbines and Generators, represents 12.2% of the Thermal assets and 0.4% of the depreciable assets studied. Based on the retirement rate analysis as presented on pages V-59 through V-60 of the Supporting Documents and on the expectations of operational staff, Gannett Fleming recommends the use of the Iowa 60-S3, as shown on page V-58 of the Supporting Documents.

Account Grouping – 1200J – Steam Generators and Auxiliaries, represents 15.1% of the Thermal assets and less than 0.5% of the depreciable assets studied. The statistical analysis indicates a life of approximately 60 years. Manitoba Hydro operational staff confirm the life expectation of 60 years. Based on the retirement rate analysis as presented on pages V-64 and V-65 of the Supporting Documents, and on the expectations of operational staff, Gannett Fleming recommends a shortening of the average service life estimate for this account from 65-R2.5 and retirement dispersion curve of this account to an Iowa 60-S2.5.

Account Grouping – 1200K – Combustion Turbine, represents 32.6% of the Thermal assets and less than 1.0% of the depreciable assets studied. The operational staff at Manitoba Hydro also confirm the life expectation of 25 years. Based on the retirement rate analysis as presented on page V-67 of the Supporting Documents, and on the expectations of operational staff, Gannett Fleming recommends no change to the average service life estimate but a slight adjustment to the retirement dispersion pattern to an Iowa 25-R3.

Account Grouping – 1200Q – Instrumentation, Control and D/C Systems, represents 7.4% of the Thermal assets and less than 0.2% of the depreciable assets studied. The statistical analysis indicates a life of approximately 25 years. Manitoba Hydro operational staff confirm the life expectation of 25 years. Based on the retirement rate analysis as presented on pages V-72 and V-73 of the Supporting Documents and on the expectations of operational staff, Gannett Fleming recommends an extension to the Iowa curve of this account from 23-L2 to an Iowa 25-S2.

Account Grouping – 1200R – Auxiliary Station Processes, represents 16.6% of the Thermal assets and less than 0.5% of the depreciable assets studied. Based on the retirement rate analysis as presented on pages V-75 and V-76 of the Supporting Documents and on the expectations of operational staff, Gannett Fleming recommends the extension of the average service life estimate for this account to the 50-R2 from the 40-R2.5 Iowa curve which was previously used.

Diesel Accounts

Account 1300B – Buildings, represents 17.2% of the Diesel assets and less than 0.1% of the depreciable assets studied. The statistical analysis indicates a life of approximately 25 years. Manitoba Hydro operational staff confirm the life expectation of 25 years. Based on the retirement rate analysis as presented on page V-81 of the Supporting Documents and on the expectations of operational staff, Gannett Fleming recommends a shortening to the Iowa curve estimate of this account from 30-R3 to an Iowa 25-R3.

Account 1300N – Engines and Generators, represents 34.9% of the Diesel assets and less than 0.1% of the depreciable assets studied. The statistical analysis indicates a life of approximately 22 years. Manitoba Hydro operational staff confirm the life expectation of 22 years. Based on the retirement rate analysis as presented on page V-83 of the Supporting Documents, and on the expectations of operational staff, Gannett Fleming recommends a shortening to the Iowa curve estimate of this account from 25-R2 to an Iowa 22-R2.

Account 1300T – Fuel Storage and Handling, represents 10.6% of the Diesel assets and less than 0.1% of the depreciable assets studied. The statistical analysis indicates a life of approximately 25 years. Manitoba Hydro operational staff confirm the life expectation of 25 years. Based on the retirement rate analysis as presented on page V-87 of the Supporting Documents, and on the expectations of operational staff, Gannett Fleming recommends a shortening to the Iowa curve estimate of this account from 30-R2 to an Iowa 25-R2.

Life Span Estimates

Life expectancy of electric generation plant assets are impacted by not only physical wear and tear of the assets, but also on economic factors including the feasibility of the economic replacement of major operating components or the economic viability of the plant as a whole. In circumstances where the replacement of major operating components is not economically feasible, the life of the major component can be the determining factor of the generation plant and all of the assets within the plant. As such, the depreciable remaining life of electric generation plant assets is the lesser of the physical life expectation of the asset or the period at the end of the life span of the generation plant.

The use of life span dates for determining depreciable lives for regulated electric generation plant is common throughout many North American Regulatory jurisdictions. The basis for the determination of the life span date is usually based on one or all of the following:

- The physical life estimation of the major and vital components of the generating plant;

- The duration of operating licenses;
- Precedent and policy of the regulatory jurisdiction;
- Expiration of the supply source for which the generation plant is dependent; and
- Expiration of market demand upon which the generation plant is dependent.

In prior depreciation reviews, Manitoba Hydro has determined a life span date for most of the regulated hydraulic plants based on an overall life estimate of 140 years beyond the date of initial construction. The management and operational staff of Manitoba Hydro have reviewed this policy and determined that it remains reasonable to determine the economic life of the generation plants on the basis of this policy. The application of this policy was reviewed for its reasonableness at each of the generation plants and was modified in three circumstances as follows:

- Pointe du Bois – March 31, 2040 (134 years);
- Laurie River – March 31, 2035 (78 years); and
- Grand Rapids – March 31, 2081 (125 years).

Due to regulation changes related to coal burning plants, a terminal date has been established for Brandon Unit 5 (coal) assuming that the plant will remain available for generation until December 31, 2019.

- Brandon Unit 5 (Coal) – December 31, 2019 (50 years).

Transmission Accounts

Account 2000G – Metal Towers and Concrete Poles, represents 49.2% of the transmission assets and 3.4% of the depreciable assets studied. The company had a previously approved life estimate of 85 years for this account. The original survivor curve as shown on page V-92 of the Supporting Documents indicated a modest level of retirement activity through age 59, with an indication of increased retirement activity thereafter. The transmission towers have historically withstood environmental influences such as ice storms, severe winter conditions and corrosion. Other than the decommissioning of the towers from Pointe du Bois there are no other significant replacement plans over the next 25 to 30 years. The Canadian peer group reviewed as part of this study indicated average service life ranges from 50 to 65 years.

Interviews with company operational staff have indicated an expectation of a longer life than the industry peers. Based on the retirement rate analysis as presented on pages V-93 through V-95 of the Supporting Documents, and on the expectations of operational staff, Gannett Fleming recommends the continued approved Iowa 85-R4 curve.

Account 2000L – Overhead Conductor and Devices, represents 35.7% of the transmission assets and 2.5% of the depreciable assets studied. The retirement pattern shows only modest retirements up until age 20 and retirements increasing at a low rate thereafter. Based on the retirement rate analysis as presented on pages V-100 through V-102 of the Supporting Documents, and on the expectations of operational staff, Gannett Fleming recommends the extension of the average service life estimate for this account from a 65-R4 Iowa curve to the Iowa 80-R4.

Substation Accounts

Account 3000B – Buildings, represents 5.6% of the substation assets and 1.2% of the depreciable assets studied. The retirement pattern as shown on pages V-106 and V-107 of the Support Documents shows modest retirements at all ages throughout the accounts life. Gannett Fleming recommends no change to the Iowa curve estimate and curve fit to this account of an Iowa 65-R4.

Account 3000F – Roads, Steel Structures and Civil Site Works, represents 10.1% of the substation assets and 2.1% of the depreciable assets studied. Comparable utilities within the electric industry have lives ranging from 50 to 57 years. The retirement pattern as shown on pages V-109 through V-111 of the Supporting Documents shows modest retirements early in this account's life and increasing thereafter. Based on the retirement rate analysis, and on the expectations of operational staff, Gannett Fleming recommends the continued use of the Iowa 50-R4 curve.

Account 3100R – Power Transformers, represents 11.6% of the substation assets and 2.4% of the depreciable assets studied. The retirement pattern shows modest retirements starting at an early age and continuing at a high rate through age

39. This account has undergone a significant amount of retirement activity since the last depreciation study with approximately $5.7 million of retirements occurring. With this large level of retirements, this account has now incurred over $48.7 million of retirements (or over 12% of all plant installed), which provides a statistically relevant base to use in the determination of the average service life estimates. As such, retirement rate analysis as provided on pages V-116 and V-117 of the Supporting Documents produced a fit of the Iowa 50-R1.5 which provides a good indication of the average service life.

The operational staff have not identified any problems with Manitoba Hydro's transformers. Manitoba Hydro has standard maintenance practices that extend the lives of the transformers for as long of a period as possible. Additionally, newer transformers are expected to have shorter lives than the older units, as the new units are being manufactured to tighter capacity tolerances. The typical industry lives range from 40 to 55 years. Based on the retirement rate analysis, and on the expectations of operational staff, Gannett Fleming recommends an Iowa 50-R1.5 curve.

Account 3100T – Interrupting Equipment, represents 7.1% of the substation assets and 1.5% of the depreciable assets studied. The retirement pattern as shown at page V-122 through V-124 of the Supporting Documents shows retirements starting early in the account's life and continuing through to age 62. Based on the retirement rate analysis Gannett Fleming recommends an extension to the Iowa curve estimate of this account from the Iowa 45-R2 to an Iowa 50-R2.5.

Account 3100U – Other Station Equipment, represents 18.6% of the substation assets and 3.9% of the depreciable assets studied. The retirement pattern is shown at pages V-126 through V-128 of the Supporting Documents. Based on the retirement rate analysis, and on the expectations of operational staff, Gannett Fleming recommends an Iowa 45-R3 curve. This is a slight extension of the Iowa curve estimate for this account from a 43-R2 to the Iowa 45-R3.

Account 3100V – Electronic Equipment and Batteries, represents 7.5% of the substation assets and 1.6% of the depreciable assets studied. The retirement pattern as shown on pages V-130 and V-131 of the Supporting Documents indicates that a life extension from the currently approved Iowa 20-R2 is required. Gannett Fleming recommends the extension of the average service life estimate for this account from a 20-R2 Iowa curve to the Iowa 25-R2.

Account 3200P – HVDC Converter Equipment, represents 14.6% of the substation assets and 3.1% of the depreciable assets studied. The retirement pattern as shown on pages V-136 and V-137 of the Supporting Documents shows modest retirements starting about year nine and slowly increasing with large retirements thereafter through age 35. This account has undergone a significant amount of retirement activity since the last depreciation study with over $22.4 million of retirements occurring. With this large level of retirements, this account has now incurred over $87.4 million of retirements (or over 17% of all plant installed), which provides a statistically relevant base to use in the determination of the average service life estimates. As such, the average service life recommendation was based primarily on the best fit analysis which indicated the Iowa 30-S4 curve. This life indication was confirmed as reasonable by the operations staff, and is therefore recommended by Gannett Fleming in this study.

Account 3200S – HDVC Serialized Equipment, represents 7.2% of the substation assets and 1.5% of the depreciable assets studied. The retirement pattern as shown at pages V-139 and V-140 of the Supporting Documents shows significant retirement activity starting at age 18 and continuing through age 38. Based on the retirement rate analysis Gannett Fleming recommends an extension to the Iowa curve estimate of this account from the Iowa 25-R2 to an Iowa 30-R5.

Account 3200U – HDVC Accessory Station Equipment, represents 5.7% of the substation assets and 1.2% of the depreciable assets studied. This account has undergone a significant amount of retirement activity since the last depreciation study with approximately $3.1 million of retirements occurring. With this large level of retirements, this account has now incurred approximately $20.3 million of retirements (or over 11% of all plant installed), which provides a statistically relevant base to use in the determination of the average service life estimates. As such, the retirement rate analysis produced a fit of the Iowa 36-R3 which provides a good indication of the average service life. As such Gannett Fleming recommends a small decrease to the Iowa curve estimate of this account from the Iowa 37-R4 to this account to an Iowa 36-R3.

Distribution Accounts

Account 4000J – Poles and Fixtures, represents 23.5% of the distribution assets and 4.7% of the depreciable assets studied. Typical industry lives for wood poles range from 25 to 55 years. The retirement rate analysis as shown on pages V-155 through V-157 of the Supporting Documents has indicated a preliminary average service life estimate of the Iowa 55-R1.5. However, it was the view of the operations staff that the life of poles within the Manitoba Hydro system should be at least 65 years based on a recent internally developed study of the poles in service.

Based on all factors, Gannett Fleming recommends an Iowa 65-S0.5 curve, which provides a reasonable fit to the actual retirement experience and conforms to the view of the Manitoba Hydro operational staff.

Account 4000L – Overhead Conductor and Devices, represents 24.9% of the distribution assets and 5.0% of the depreciable assets studied. The retirement rate analysis as shown on pages V-159 and V-160 have indicated a high rate of early retirements leading to a low-mode Iowa curve. The currently approved life estimate for this account is the Iowa 60-R2 which is consistent with the operational staff indications that they are seeing no major issues with conductors and they would expect lives of conductor to be approximately 60 years. Based on all factors, Gannett Fleming recommends a reduction of the mode of the curve to an Iowa 60-R1.5, which maintains the average service life estimate for the previous depreciation study but adjusts to a lower mode to recognize the increased level of early retirement experience.

Account 4000N – Underground Cable and Devices - Primary, represents 13.0% of the distribution assets and 2.6% of the depreciable assets studied. Operational staff indicated there are no major issues with newer underground cable installed within the last 25 years. Cable previously installed, however, is experiencing retirements at about 45 years. Based on the retirement rate analysis as shown on pages V-165 and V-166 of the Supporting Documents and on more recent expectations of operational staff, Gannett Fleming recommends a small adjustment of the approved Iowa 60-R4 curve to an Iowa 60-R3 curve.

Account 4000P – Underground Cable and Devices - Secondary, represents 8.7% of the distribution assets and 1.8% of the depreciable assets studied. The newer underground cable is about 28 years old and is showing no major issues according to Manitoba Hydro's operational staff. Underground cable installed prior to this vintage is starting to retire at about 45 years. Based on the retirement rate analysis as shown on pages V-168 and V-169 of the Supporting Documents and the expectations of operational staff along with industry comparables, Gannett Fleming recommends an Iowa 44-S3 curve, which represents a small adjustment to the currently approved Iowa 45-R4.

Account 4000Q – Serialized Equipment - Overhead, represents 7.6% of the distribution assets and 1.5% of the depreciable assets studied. The investment in this account primarily relates to pole top transformers. Interviews with operational staff indicated the company intends to continue to refurbish and reuse transformers. Based on the retirement rate analysis as shown on pages V-171 through V-173 of the Supporting Documents and the expectations of operational staff along with industry comparables, Gannett Fleming recommends an extension from the currently approved Iowa 35-R3 curve to the Iowa 45-R3 curve.

PART III. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART III. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

Group Depreciation Procedures

When more than a single item of property is under consideration, a group procedure for depreciation is appropriate because normally all of the items within a group do not have identical service lives, but have lives that are dispersed over a range of time. There are two primary group procedures, namely, Average Service Life (ASL) and Equal Life Group (ELG).

In the ELG procedure, the property group is subdivided according to service life. That is, each equal life group includes that portion of the property which experiences the life of that specific group. The relative size of each equal life group is determined from the property's life dispersion curve. The calculated depreciation for the property group is the summation of the calculated depreciation based on the service life of each equal life group.

The table on the following page presents an illustration of the calculation of equal life group depreciation in a mass property account using the Iowa 15-L3 survivor curve, 0 percent net salvage and a December 31, 2013 calculation date. In the table, each equal life group is defined by the age interval shown in columns 1 and 2. These are the ages at which the first and last retirement of each group occurs, and the group's equal life, shown in column 3, is the midpoint of the interval. For purposes of the calculation, each vintage is divided into equal life groups arranged so that the midpoint of each one-year age interval coincides with the calculation date, e.g., December 31 in this case. This enables the calculation of annual accruals for a twelve-month period centered on the date of calculation.

The retirement during the age interval, shown in column 4, is the size of each equal life group and is derived from the Iowa 15-L3 survivor curve and 0 percent net salvage. It is the difference between the percents surviving at the beginning and end of the age interval. Each equal life group's annual accrual, shown in column 5, equals the group's size (column 4) divided by its life (column 3).

Columns 7 through 10 show the derivation of the annual and accrued factors for each vintage based on the information developed in the first five columns. The year installed is shown in column 6. For all vintages other than 2013, the summation of annual accruals for each year installed, shown in column 7, is calculated by adding one-half of the group annual accrual (column 5) for that vintage's current age interval plus the group annual accruals for all succeeding age intervals. For example, the figure 7.54580659712 for 2012 equals one-half of 0.00417333333 plus all of the succeeding figures in column 5. Only one-half of the annual accrual for the vintage's current age interval group is included in the summation because the equal life group for that interval has reached the year during which it is expected to be retired.

TOTAL			100.00000						

The summation of annual accruals (column 7) for installations during 2012 is calculated on the basis of an in-service date at the midpoint of the year, i.e., June 30. Inasmuch as the overall calculation is centered on December 31, 2013, the first figure in column 7, for vintage 2014, equals all of the group annual accrual for the first equal life group plus the accruals for all of the subsequent equal life groups.

The average percent surviving derived from the Iowa 15-L3 survivor curve and 0 percent net salvage, is shown in column 8 for each age interval. The annual factor, shown in column 9, is the result of dividing the summation of annual accruals (column 7) by the average percent surviving (column 8). The accrued factor, shown in column 10, equals the annual factor multiplied by the age of the group at December 31, 2013.

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization period and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

For the purpose of calculating annual amortization amounts as of March 31, 2014, the book depreciation reserve for each plant account or subaccount is assigned or allocated to vintages. The book reserve assigned to vintages with an age greater than the amortization period is equal to the vintage's original cost. The remaining book reserve is allocated among vintages with an age less than the amortization period in proportion to the calculated accrued amortization. The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period. The annual amortization amount is determined by dividing the future amortizations (original cost less allocated book reserve) by the remaining period of amortization for the vintage.

Amortization accounting is proposed for a number of accounts that represent numerous units of property, but a very small portion of depreciable plant in service. The accounts and their amortization periods are as follows:

ACCOUNT	TITLE	AMORTIZATION PERIOD, YEARS
Group 000C	Hydraulic Generation - Powerhouse Renovations	40
Group 000L	Hydraulic Generation – License Renewal	50
Group 000W	Hydraulic Generation - Support Building Renovations	20
Group 000Z	Hydraulic Generation – Community Development Costs	78-90
1200C	Thermal Generation – Powerhouse Renovations	40
1200L	Thermal Generation - License Renewal	50
1200W	Thermal Generation – Support Building Renovations	20
1300C	Diesel Generation – Building Renovations	15
1300M	Diesel Generation – Engine and Generators – Overhauls	4
2000K	Transmission – Ground Line Treatment	10
2000Z	Transmission – Community Development Costs	79
3000C	Substations – Building Renovations	20
3200N	Substations – Synchronous Condenser Overhauls	15
4000K	Distribution – Ground Line Treatment	12
4000V	Distribution - Electronic Equipment	10
4900W	Meters - Metering Exchanges	15
5000C	Communication – Building Renovations	20
5000K	Communication – Operational IT Equipment	5

5000N	Communication – Operational Data Network	8
8000C	General Plant – Building Renovations	20
8000F	General Plant – Leasehold Improvements – Sony Place	10
9000H	General Plant – Tools, Shop and Garage Equipment	15
9000K	General Plant – Computer Equipment	5
9000L	General Plant – Office Furniture and Equipment	20
9000M	General Plant – Hot Water Tanks	6
A100A	Easements	75
A200H	Computer Development – Small Systems	10
A200J	Computer Software – General	5
A200K	Computer Software – Communication/Operational	5

MONITORING OF BOOK ACCUMULATED DEPRECIATION

The calculated accrued depreciation or amortization represents that portion of the depreciable cost which will not be allocated to expense through future depreciation accruals, if current forecasts of service life characteristics and net salvage materialize and are used as a basis for depreciation accounting. Thus, the calculated accrued depreciation provides a measure of the book accumulated depreciation. The use of this measure is recommended in the amortization of book accumulated depreciation variances to insure complete recovery of capital over the life of the property.

The recommended amortization of the variance between the book accumulated depreciation and the calculated accrued depreciation is based on an amortization period equal to the composite remaining life for each property group.

The composite remaining life for use in the calculation of accumulated depreciation variances is derived by developing the composite sum of the individual equal life group remaining lives in accordance with the following equation:

$$\text{Composite Remaining Life} = \frac{\sum\left(\frac{\text{Book Cost}}{\text{Life}} \text{ x Remaining Life}\right)}{\sum \frac{\text{Book Cost}}{\text{Life}}}.$$

The book costs and lives of the several equal life groups, which are summed in the foregoing equation, are defined by the estimated future survivor curve. Inasmuch as book cost divided by life equals the whole life annual accrual, the foregoing equation reduces to the following form:

$$\text{Composite Remaining Life} = \frac{\sum \text{Whole Life Future Accruals}}{\sum \text{Whole Life Annual Accruals}}$$

or

$$\text{Composite Remaining Life} = \frac{\sum \text{Book Cost - Calc. Reserve}}{\sum \text{Whole Life Annual Accrual}}.$$

PART IV. RESULTS OF STUDY

PART IV. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and for the change of the composition of property in service. The annual accrual rates and the accrued depreciation were calculated in accordance with the straight line method, using the equal life group procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

DESCRIPTION OF DETAILED TABULATIONS

The service life estimates were based on judgment that incorporated statistical analysis of retirement data, discussions with management and consideration of estimates used by other electric utilities. The results of the statistical analysis of service life are presented in the section beginning on V-2 of the Supporting Documents.

For each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves is followed by a tabular presentation of the original life table(s) plotted on the chart. The survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the curve type designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. The titles of the chart indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which where plotted. The experience band indicates the range of years for which retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation applicable to depreciable assets of Manitoba Hydro as of March 31, 2014 are presented in account sequence starting on page VI-2 of the Supporting Documents. The tables of the calculated annual depreciation applicable to depreciable assets of Wuskwatim Power Limited Partnership as of March 31, 2014 are presented in account sequence starting on page VI-323 of the Supporting Documents. Additionally, the tables indicate the estimated average survivor curves used in the calculations, and set forth, for each installation year, the original cost, calculated accrued depreciation, and the calculated annual accrual.

APPENDIX A

ESTIMATION OF SURIVOR CURVES

ESTIMATION OF SURVIVOR CURVES

Average Service Life

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages. A discussion of the general concept of survivor curves is presented. Also, the Iowa type survivor curves are reviewed.

SURVIVOR CURVES

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the

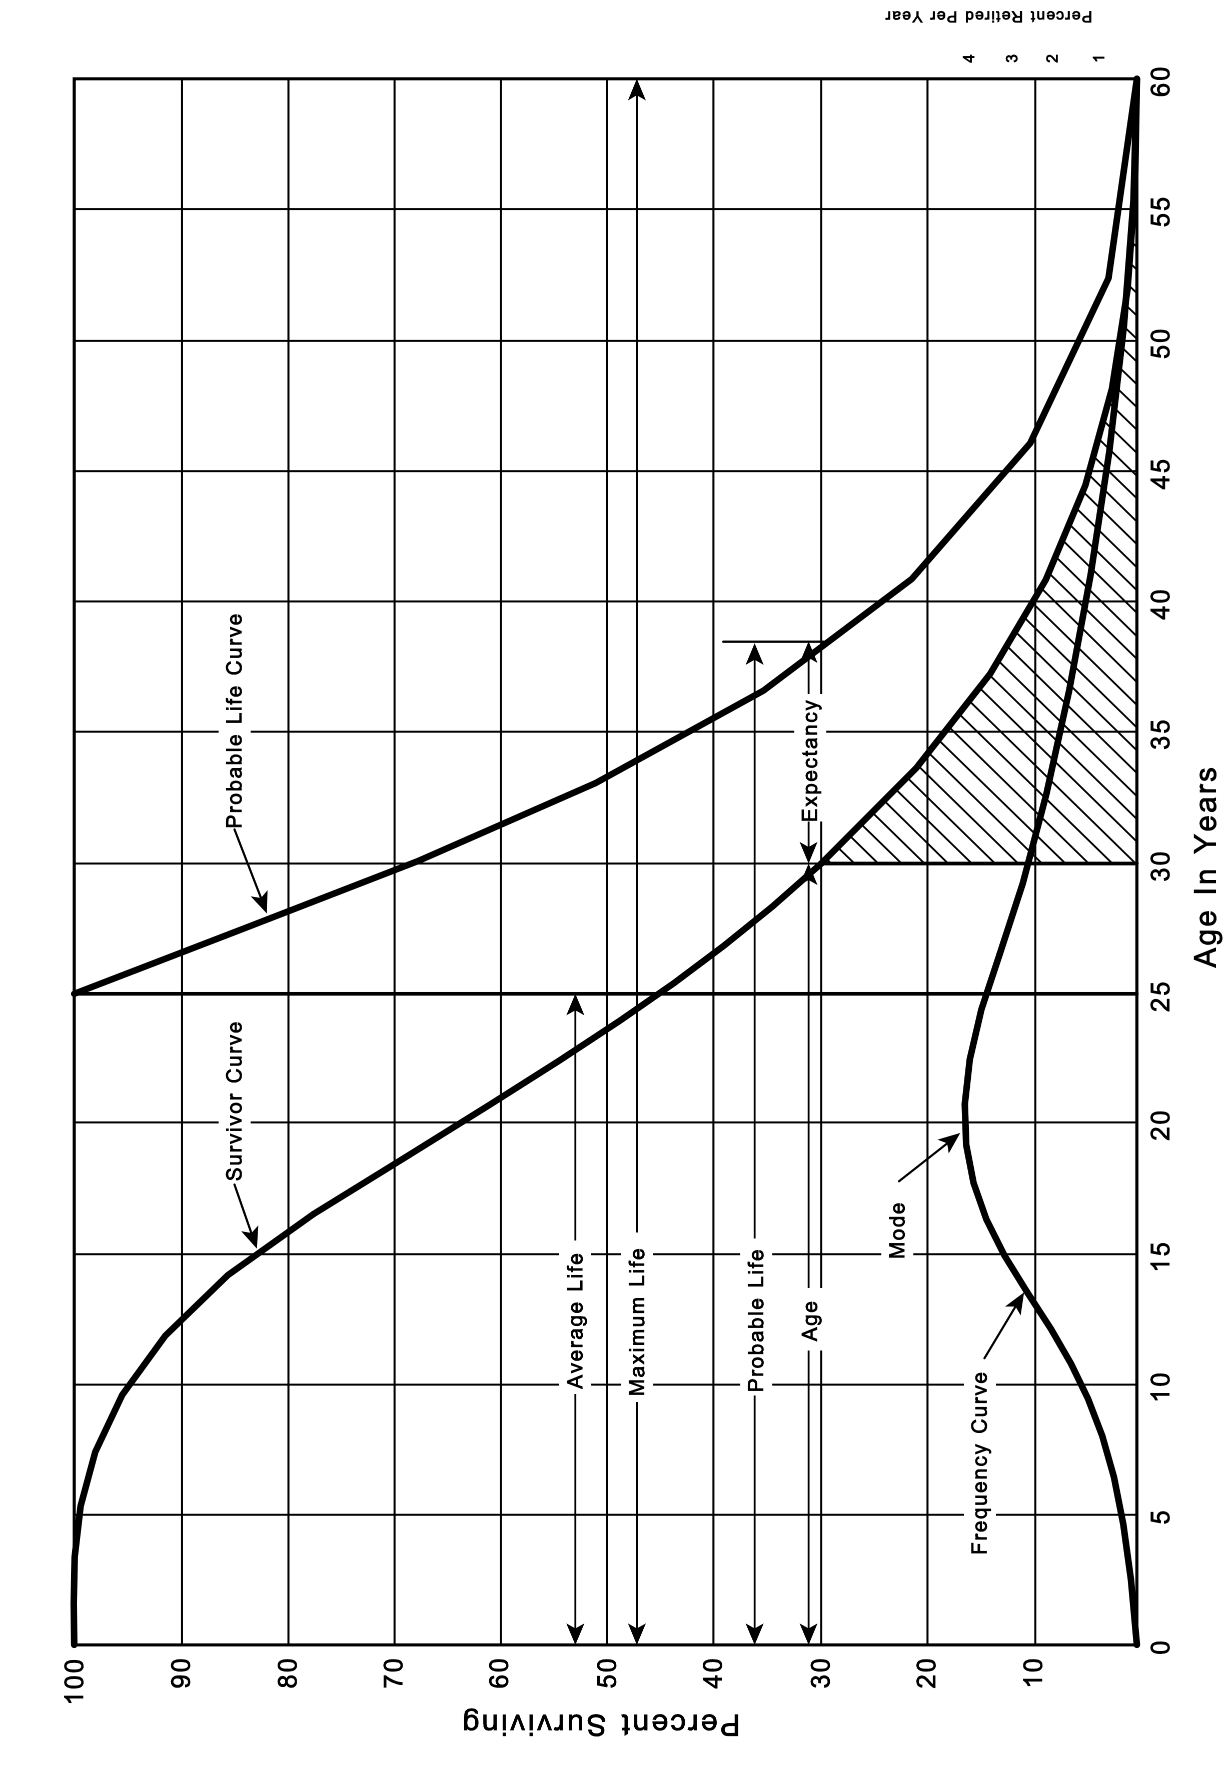

Figure 1. A Typical Survivor Curve and Derived Curves

Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.[1] These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."[2] In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis[3] presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text, and is also explained in several publications, including "Statistical Analyses of Industrial Property Retirements,"[4] "Engineering Valuation and Depreciation,"[5] and "Depreciation Systems."[6]

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the <u>experience band</u>, and the band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the <u>placement band</u>. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2004-2013 during which there were placements during the years 1999-2013. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on the following pages. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, $10,000 of the dollars invested in 1999 were

Parentheses Denote Credit Amount.

retired in 2004. The $10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of $143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2004 retirements of 1999 installations and ending with the 2013 retirements of the 2008 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on the following page. The surviving plant at the beginning of each year from 2004 through 2013 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition, are obtained by adding or subtracting the net entries

SCHEDULE 3. PLANT EXPOSED TO RETIREMENT JANUARY 1
OF EACH YEAR 2004-2013
SUMMARIZED BY AGE INTERVAL

Total	1,975	2,382	2,824	3,318	3,872	4,494	5,247	6,017	6,852	7,799	44,780	

[a] Additions during the year.

shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2006 are calculated in the following manner:

Exposures at age 0	= amount of addition	= \$750,000
Exposures at age ½	= \$750,000 - \$ 8,000	= \$742,000
Exposures at age 1½	= \$742,000 - \$18,000	= \$724,000
Exposures at age 2½	= \$724,000 - \$20,000 - \$19,000	= \$685,000
Exposures at age 3½	= \$685,000 - \$22,000	= \$663,000

For the entire experience band 2001-2010, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.

Original Life Table

The original life table, illustrated in Schedule 4 on the following page**,** is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent

SCHEDULE 4. ORIGINAL LIFE TABLE

13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
Column 3 from Schedule 1, Column 12, Retirements for Each Year.
Column 4 = Column 3 divided by Column 2.
Column 5 = 1.0000 minus Column 4.
Column 6 = Column 5 multiplied by Column 6 as of the Preceding Age Interval.

surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15				
Exposures at age 4½	=	3,789,000				
Retirements from age 4½ to 5½	=	143,000				
Retirement Ratio	=	143,000	÷	3,789,000	=	0.0377
Survivor Ratio	=	1.000	-	0.0377	=	0.9623
Percent surviving at age 5½	=	(88.15)	x	(0.9623)	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless. The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

MANITOBA HYDRO

2015/16 & 2016/17 GENERAL RATE APPLICATION

APPENDIX 5.7
ACCOUNTING POLICY & ESTIMATE CHANGES

1.0 ACCOUNTING POLICY & ESTIMATE CHANGES

In Order 43/13, the PUB accepted the accounting policy changes that have been made by Manitoba Hydro to 2013/14 for the purposes of rate setting but indicated that until an IFRS Status Update Report is filed at the next GRA, no further changes should be made for rate-setting purposes.

> *"The Board understands that Manitoba Hydro has been making changes to its accounting policies since 2007/08 to be more consistent with other electric utilities as well as to be consistent with International Financial Reporting Standards. The Board in past orders had expressed concern with the level of capitalization and Manitoba Hydro has begun to address these concerns. In the Board's view, Manitoba Hydro's proposed accounting changes are appropriate for the test years. The Board will direct Manitoba Hydro to file an International Financial Reporting Standards status update at the next General Rate Application. Until such time, the Board expects Manitoba Hydro not to make any further accounting changes for rate-setting purposes."* (Order 43/13, pages 14-15)

> *"The Board accepts the depreciation rates applied April 1, 2011, which rates reflect the changes in service lives and the true-up of the accumulated depreciation surplus for the two test years. The Board also accepts Manitoba Hydro's position that net salvage should be removed from depreciation rates when International Financial Reporting Standards are implemented rather than during the test years."*(Order 43/13, page 18)

There are a number of prospective accounting changes that Manitoba Hydro is making for financial reporting purposes in 2014/15 and 2015/16. The most significant of these include the implementation of a comprehensive depreciation study in 2014/15 and further changes to the level of capitalized overhead and deprecation methodologies as part of the implementation of IFRS in 2015/16. These changes are discussed in the following sections.

2.0 DEPRECIATION STUDY 2014/15

Manitoba Hydro recently completed a new depreciation study in October 2014, which developed new Canadian GAAP (CGAAP) and IFRS compliant depreciation rates. In 2014/15, the Corporation will be implementing new CGAAP depreciation rates that reflect the extension of services lives of certain asset groups, which reduces annual depreciation expense. As outlined in Appendix 5.7 this change in accounting estimate of the asset service lives results in a reduction in depreciation expense of $25 million in 2014/15, $29 million in 2015/16, and $30 million in 2016/17.

3.0 IFRS IMPLEMENTATION 2015/16

Manitoba Hydro will be transitioning to IFRS effective April 1, 2015 for its 2015/16 fiscal year with comparative information presented for 2014/15. In addition, Manitoba Hydro will early adopt interim standard IFRS 14 Regulatory Deferral Accounts upon transition. This interim standard allows Manitoba Hydro to continue to recognize regulated assets and liabilities. This standard will provide temporary guidance until the IASB completes its comprehensive project on Rate-regulated accounting, which is expected to take several years to complete. MH14 assumes that regulatory deferral accounts will continue to be recognized throughout the 20 year forecast period. Please see Appendix 5.4 for the IFRS Status Update Report.

Generally speaking, the transition to IFRS will result in timing differences between when expenditures are recognized into income between Canadian Generally Accepted Accounting Principles (CGAAP) and IFRS. Manitoba Hydro recognizes that the different financial reporting requirements under IFRS will both increase and decrease annual net income. As such, Manitoba Hydro has considered the range of potential impacts and where possible, has selected accounting policies aimed at minimizing the overall impact to financial results and revenue requirements.

The primary impacts of IFRS accounting policy changes that are included in MH14 are as follows:

- Administrative and other general overhead costs are not eligible for capitalization under IFRS and must be expensed as incurred (please see Appendix 5.5 for more information);
- IFRS is more rigorous in terms of the componentization of assets and the recognition of gains and losses on the disposal/retirement of assets and does not allow the inclusion of asset retirement costs in depreciation rates (please see Appendix 5.7 for more information and the results of the 2014 electric depreciation study); and,
- Unamortized experience gains and losses on pension balances will be reclassified to accumulated other comprehensive income (AOCI) upon transition to IFRS.

3.0 TOTAL IMPACT OF ACCOUNTING POLICY AND ESTIMATE CHANGES

As summarized in the table below, the overall impacts of the accounting policy and estimate changes that are forecast to be made in 2014/15 and 2015/16 offset each other and result in an overall reduction in Manitoba Hydro's future revenue requirements. The significance of the net changes are minimal in the 2015 to 2017 period, and as such are not driving the need for the proposed rate increases.

Figure 5.6.1: Accounting Policy & Estimate Changes

Accounting Policy & Estimate Changes Electric operations (in millions of $s)	**2015**	**2016**	**2017**	**2018**	**2019**	**2020**	**2021**	**2022**	**2023**	**2024**
OM&A Expense Changes		51	56	57	58	58	59	60	61	62
Depreciation Expense Changes	(25)	(53)	(57)	(60)	(76)	(86)	(96)	(101)	(103)	(105)
Other		(3)	(3)	(4)	(3)	(3)	(4)	(4)	(3)	(4)
Total Increase (Decrease) in Revenue Requirement	(25)	(4)	(4)	(7)	(22)	(31)	(41)	(45)	(46)	(48)

Given the offsetting nature of the various IFRS accounting changes and the depreciation estimate change as noted in the figure above, as well as the adoption of the interim standard IFRS 14 Regulatory Deferral Accounts, the use of IFRS financial reporting policies for rate-setting purposes is appropriate as there is no negative impact to ratepayers.

The following schedules provide additional detail with respect to the accounting policy and estimate changes in MH14.

Reference	Description	Accounting Handbook Reference
1	The reduction in administrative and general overhead capitalized reflects adjustments to comply with IFRS upon transition. IFRS does not permit the capitalization of general administrative and overhead costs. The adjustments result in the following: • an annual increase in operating and administrative expense; • reductions in plant asset values for amounts no longer capitalized; and • reductions in depreciation expense as a result of reduced asset values.	**IFRS - IAS 16 Property, plant & equipment:** .19 Examples of costs that are not costs of an item of property, plant and equipment are:,… (d) administration and other general overhead costs.
2	IFRS requires uniform accounting policies to be applied to all entities in a consolidated group. Manitoba Hydro will be harmonizing its accounting policy with respect to costs associated with its Meter Sampling, Exchange and Testing program.	**IFRS 10 Consolidated Financial Statements** 19 A parent shall prepare consolidated financial statements using uniform accounting policies for like transactions and other events in similar circumstances. Uniform accounting policies: B87 If a member of the group uses accounting policies other than those adopted in the consolidated financial statements for like transactions and events in similar circumstances appropriate adjustments are made to that group member's financial statements in preparing the consolidated financial statements to ensure conformity with the group's accounting policies.
3	Overall, changes to the accounting for pension and benefits results in an increase in pension and benefit costs upon transition to IFRS. The primary pension accounting changes include: • upon transition, unamortized pension gains and losses will be adjusted to accumulated other comprehensive income; • the elimination of "corridor" determined amortization for unrealized pension experience gains and losses as IFRS requires annual gains and losses to be recognized in Other Comprehensive Income; and • the use of the pension discount rate for recording expected returns on plan assets as opposed to the expected market interest rate of return as per CGAAP.	**IFRS – IAS 19 Employee Benefits:** .120 An entity shall recognize the components of defined benefit cost, except to the extent that another IFRS requires or permits their inclusion in the cost of an asset, as follows: (a) service cost in profit or loss;…, (c) re-measurements of the net defined benefit liability (asset) in other comprehensive income. .125 Interest income on plan assets is a component of the return on plan assets, and is determined by multiplying the fair value of the plan assets by the discount rate specified in paragraph 83, both as determined at the start of the annual reporting period, taking account of any changes in the plan assets held during the period as a result of contributions and benefit payments. .103 An entity shall recognize past service cost as an expense at the earlier of

		the following dates: (a) when the plan amendment or curtailment occurs; and (b) when the entity recognizes related restructuring costs or termination benefits (see paragraph 165).
Reference	**Description**	**Accounting Handbook Reference**
4	**Employee benefits:** The primary employee benefit related changes include: • upon transition, unamortized past service adjustments will be adjusted to retained earnings; and • future annual benefits expense will be higher for the recognition of benefits attributed to unvested employees for benefits such as sick leave and severance. Such unvested benefits were not recognized under CGAAP, but are required to be recognized under IFRS.	**Employee Benefits:** .15 Accumulating paid absences are those that are carried forward and can be used in future periods if the current period's entitlement is not used in full. ,…, An obligation arises as employees render service that increases their entitlement to future paid absences. The obligation exists, and is recognized, even if the paid absences are non-vesting, although the possibility that employees may leave before they use an accumulated non-vesting entitlement affects the measurement of that obligation.
5	The net result of the 2014 depreciation study and the average service life approach is an overall reduction in annual depreciation expense for MH due to changes in the service lives for certain asset groups. This change is required to be implemented under Canadian GAAP.	**CGAAP – 3061 Property, plant & equipment:** .28 Amortization should be recognized in a rational and systematic manner appropriate to the nature of an item of property, plant and equipment with a limited life and its use by the enterprise. .33 The amortization method and estimates of the life and useful life of an item of property, plant and equipment should be reviewed on a regular basis. [DEC. 1990 *****]
6	Upon adoption of IFRS, MH will be removing the impact of net salvage from depreciation rates.	-The Inclusion of net salvage in depreciation rates is a regulatory practice applied under CGAAP by Canadian utilities. Manitoba Hydro will be removing negative salvage from depreciation rates in order to manage the other accounting changes and minimize overall impacts to revenue requirement.
7	In order to satisfy the componentization requirements of IFRS, MH will be moving from the Average Service Life method of depreciation to the Equal Life Group method upon its adoption of IFRS.	**IFRS - IAS 16 Property, plant & equipment:** The key IFRS references supporting the move to the ELG method are: .43 Each part of an item of property, plant and equipment with a cost that is significant in relation to the total cost of the item shall be depreciated separately.

		.68 The gain or loss arising from the de-recognition of an item of property, plant and equipment shall be included in profit or loss when the item is de-recognized. Gains shall not be classified as revenue.
8	The changes to finance expense and capital and other taxes reflect the cumulative impacts of changes 1 – 7 as identified in this chart.	**Please see descriptions as provided in 1- 7.**

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

PROPOSED RATES AND CUSTOMER IMPACTS

INDEX

Appendices

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

PROPOSED RATES AND CUSTOMER IMPACTS

6.0 OVERVIEW

Tab 6 provides the proposed rates and customer impacts for the proposed rate changes in this Application. Section 6.1 provides Manitoba Hydro's general rate making objectives; Section 6.2 provides details of the proposed rates by customer class and the customer bill impacts of the proposed rate changes; Section 6.3 describes the proposed implementation of Time-of-Use ("TOU") Rates effective April 1, 2016 for the General Service Large Customer Class served at greater than 30 kV; Section 6.4 outlines proposed changes and approvals requested with respect to the Surplus Energy Program ("SEP") and the Curtailable Rates Program ("CRP"). Section 6.5 discusses Manitoba Hydro's current review of its Cost of Service Study and the related Stakeholder Engagement process that has been undertaken. Section 6.6 provides a comparison of electricity rates across other jurisdictions and provides context to the rate pressures experienced in general in the Canadian electric utility industry.

The key observations of Tab 6 are:

1. Manitoba Hydro has applied the proposed 3.95% rate increases to all components of the rates (monthly basic charges, energy charges and demand charges) on an across-the-board basis for all customer classes, sufficient to generate additional revenue of $57.4 million for fiscal 2015/16, and $59.9 million for fiscal 2016/17.

2. Manitoba Hydro is requesting approval to implement TOU rates for customers in the General Service Large customer classes served at greater than 30 kV, effective April 1, 2016. The introduction of a TOU rate enables Manitoba Hydro to provide more appropriate price signals to large energy users that is more reflective of the value of energy in the on-peak period.

3. Manitoba Hydro is seeking confirmation that the PUB accepts the rates flowing from the changes to the terms and conditions of the SEP and CRP programs that were approved on an interim basis in Order 43/13.

4. Manitoba Hydro has undertaken a stakeholder engagement process to facilitate the sharing of views and alternatives to Cost of Service Study ("COSS") methodology to identify possible alternative treatments for the assumptions in the methodology. The Corporation will continue its examination of its COSS with a goal of advancing its next COSS for public review at an appropriate time that will be determined in conjunction with the PUB and stakeholders.

5. The issue of aging infrastructure is facing all utilities in North America and is resulting in considerably higher rate increases than are being projected in Manitoba. For this reason, even with the proposed and indicative rate increases in MH14, it is expected that Manitoba's domestic electricity customers will continue to have rates that are affordable and competitive with other utilities in North America.

6.1 <u>RATE OBJECTIVES</u>

Manitoba Hydro's general rate making objectives are set out as follows:

1. Manitoba Hydro's long-term target is to have all class Revenue Cost Coverage (RCC) ratios in the range of 95% to 105%, and further that all classes should be gradually moved toward RCC's of unity.

2. In conformity with the principles of gradualism and sensitivity to customer impacts, annual adjustments to revenues by customer class are less than two percentage points greater than the overall proposed increase.

3. Whenever possible, rates should be designed with a view to sending the appropriate price signal regarding the cost of energy to those parts of the rate design affecting the use which would be most sensitive to such a signal.

4. Maintain Manitoba Hydro's competitive position with respect to rates charged by other Canadian utilities for all rate classes.

5. The combined impact of proposed class average rate increases and adjustments to rate structure results in customer monthly impacts which fall within Manitoba Hydro's guidelines:

– For Residential customers, no customer will experience a bill increase which exceeds the greater of $3.00 per month or three percentage points more than the class average increase.

– For General Service customer, no customer will experience an increase in their average monthly bill over a year which exceeds the greater of $5.00 per month or five percentage points more than the class average increase.

6.2 PROPOSED RATE CHANGES & CUSTOMER IMPACTS BY CLASS

The following sections discuss the proposed rate schedules and customer impacts. A Proof of Revenue for each fiscal year (2015/16 and 2016/17) detailing the total revenue increase by customer class is provided in Appendices 6.1 and 6.2. Rate Schedules for proposed rates effective April 1, 2015 and April 1, 2016 are provided in Appendices 6.3 and 6.4, respectively. Appendices 6.5 and 6.6 provide Bill Comparisons between current May 1, 2014 rates, proposed April 1, 2015 rates and proposed April 1, 2016 rates.

On a class basis, the increase in revenues is shown in the following figure:

Figure 6.1 Recovery of Additional Revenues By Customer Sub-Class

Customer Class	2015/16 Additional $(millions)	2016/17 Additional $(millions)
Residential	$23.8	$25.2
GS Small*	$11.6	$12.3
GS Medium	$8.0	$8.5
GS Large	$13.8	$14.4
A&R Lighting	$0.9	$0.9
Misc. & DSM	($0.7)	($1.4)
Total GCR	$57.4	$59.9

*includes revenues from General Service customers in Diesel Communities

6.2.1 Residential

The proposed 3.95% increase applied to the current rates for the residential class would result in a monthly Basic Charge of $7.57 and an Energy Charge of $0.07672 per kWh for rates effective April 1, 2015. For the following fiscal year, the proposed 3.95% increase would result in a Basic Charge of $7.87 and an Energy Charge of $0.07975 per kWh for rates effective April 1, 2016.

A residential customer, without electric space heat, with an average usage of 1,000 kWh per month would experience an increase in their monthly bill of $3.20 for 2015/16 and $3.33 for 2016/17. A residential customer with electric space heat, using an average of 2,000 kWh a month, would experience increases of $6.11 and $6.36 per month for April 1, 2015 and April 1, 2016, respectively.

6.2.2 General Service Small and Medium

Manitoba Hydro is proposing to apply the 3.95% rate increase across all rate components in the General Service Small and Medium rate sub-classes.

Prior to the 2012/13 & 2013/14 General Rate Application, Manitoba Hydro was gradually adjusting the application of rate increases to eventually achieve the consolidation of the General Service ("GS") Small and Medium rate classes. At the present time, the rates for these two classes vary only with respect to the monthly Basic Charge and Three Phase Charge. As the proposed rate increases are to be applied to all rate components, including Basic Charges and Three Phase Charges, no additional consolidation of these rate classes will result with this Application.

A 3.95% increase on April 1, 2015 would result in the Basic Charge increasing to $20.51 for the GS Small Single Phase and $28.92 for the GS Small Three Phase. It is proposed that on April 1, 2016 these charges will increase to $21.32 and $30.06 respectively. The Basic Charge for the GS Medium class is proposed to increase to $30.52 on April 1, 2015 and to $31.73 on April 1, 2016. All components of the Energy Charge are proposed to increase by 3.95% each of the fiscal years as shown below:

Figure 6.2 Energy Charges for General Service Small and Medium

	April 1, 2015	April 1, 2016
1st 11,000 kWh @	$0.08058 / kWh	$0.08376 / kWh
Next 8,500 kWh @	$0.05594	$0.05815
Balance of kWh	$0.03692	$0.03838

In keeping with the past application of these demand charges, the first 50 kV.A of Billing Demand each month will not be charged, but for demand in excess of 50 kV.A the rate is proposed to increase 3.95% to $9.45 on April 1, 2015 and to $9.82 on April 1, 2016.

6.2.3 General Service Diesel Rates

Manitoba Hydro is proposing to apply the 3.95% increases to both the grid portion of the rate structure (equal to that proposed for grid customers) and the non-grid portion of the rate applicable to general service and government customers in the four remote communities served by diesel generation (Shamattawa, Brochet, Lac Brochet and Tadoule Lake). For General Service non-government customers, the first 2,000 kWh per month will be the same as the grid-rate equivalent as the General Service Small and Medium customer class first block rate. Energy usage in excess of 2,000 kWh per month is proposed to increase by 3.95% in 2015 to $0.41232 per kWh, and increase an additional 3.95% in 2016 to $0.42861 per kWh. For General Service government customers, including First Nation Education accounts, all energy is proposed to be charged at the rate of $2.5095 for rates effective April 1, 2015 and $2.6086 for rates effective April 1, 2016.

6.2.4 General Service Large

This Application seeks a 3.95% increase to both the Energy Charge and Demand Charge for the General Service Large sub-classes to be effective on April 1, 2015.

The present standard rate design, comprised of a single Energy Charge and a single Demand Charge, is proposed for rates effective April 1, 2015 for all three sub-classes of the General Service Large class. In this Application, both the Energy Charge and Demand Charge for all three General Service Large sub-classes is proposed to increase by 3.95% on April 1, 2015:

- The Large 750V-30 kV sub-class would have an Energy Charge of $0.03472 per kWh and a Demand Charge of $8.02 per kV.A.
- The Large 30-100 kV sub-class would have an Energy Charge of $0.03228 per kWh and Demand Charge of $6.87 per kV.A.
- The Large >100 kV sub-class would have an Energy Charge of $0.03128 per kWh and Demand Charge of $6.11 per kV.A.

For rates effective April 1, 2016, rates for the General Service Large 750V-30 kV sub-class would increase an additional 3.95% resulting in an Energy Charge of $0.03609 and a Demand Charge of $8.34 per kV.A. This would result in bill increases averaging 3.95% depending on load factor.

For customers in the GSL 30-100 kV and GSL > 100 kV sub-classes, Manitoba Hydro is proposing to introduce a Time-of-Use ("TOU") rate design effective April 1, 2016. Please see Section 6.3 on TOU rates for information on the derivation and level of rates for GSL 30 – 100 kV and GSL > 100 kV customer sub-classes.

The bill impacts provided in Appendix 6.6 for the GSL 30-100 and GSL > 100 sub-classes provide two sets of comparisons. The first compares the proposed April 1, 2015 rates to the proposed April 1, 2016 TOU rates. This comparison produces an aggregate view of the bill impacts which includes both the 3.95% general rate increase as well as the impact of the change from the current rate design to the TOU rate design. In order to isolate the bill impact of the rate design change alone, a second set of bill impacts is provided which compares the proxy rates under the current rate design for April 1, 2016 versus the proposed TOU rates. This comparison presents the impact of the introduction of the TOU rate design exclusive of the 3.95% rate increase.

The TOU rates proposed for April 1, 2016 also include a proposal to increase the demand ratchets for the Large >30 kV customers from 25% to 50% of contract demand or 50% of the highest recorded demand in the past 12 months. Please refer to Section 6.3 for a more detailed explanation of this proposed change to the demand ratchets.

6.2.5 Area and Roadway Lighting

Manitoba Hydro is proposing to apply the 3.95% rate increase to the Area and Roadway Lighting class for each of the two fiscal years. In addition, Manitoba Hydro is seeking approval of rates for street lighting using new Light Emitting Diode ("LED") technology. In addition to the LED rate categories approved on an interim basis in Order 79/14, Manitoba Hydro is proposing additional new LED rate categories to address the additional street lighting sizes and wattages, as found on page 21 of Appendix 6.3 and page 22 of Appendix 6.4. Please see Appendix 6.13 for Manitoba Hydro's letter of June 23, 2014, requesting PUB approval to implement LED Rates.

6.2.6 Limited Use of Billing Demand ("LUBD") Rate Option

The rates proposed for LUBD customers are derived from the rates proposed for General Service Small, Medium and Large customer classes. The monthly Basic Charge will increase to the same level as regular GS Small/Medium customers. The Demand Charge is set at approximately 25% of the Demand Charge of the corresponding regular General

Service class, with the energy charge calculated to provide revenue neutrality at a load factor of approximately 18%.

A copy of the latest LUBD report filed with the PUB, covering the period April 1, 2013 to March 31, 2014, is included as Appendix 6.12.

6.2.7 Flat Rate Water Heating ("FRWH")

Manitoba Hydro proposes to apply the 3.95% rate increase to the rate components for both Residential and General Service FRWH customers. There are approximately 3,600 Residential FRWH customers and approximately 370 General Service FRWH customers, and the number of customers on FRWH has been declining by approximately 5% per year.

6.3 TIME-OF-USE RATES FOR GENERAL SERVICE LARGE

Manitoba Hydro is requesting approval to implement TOU rates for customers served in the GSL 30-100 kV and GSL > 100 kV sub-classes, effective April 1, 2016. The proposed TOU rates shown in the April 1, 2016 rate schedules have been designed to recover the same level of revenue (revenue neutral) that would have been recovered through the present standard rate design.

The introduction of a TOU rate enables Manitoba Hydro to provide more appropriate price signals to large energy users and to provide a clear indication of the value of energy to Manitoba Hydro. It also provides industrial customers with a rate design that will incent customers to optimize their energy usage and facilitates opportunities for managing their energy bills. This rate design further assists Manitoba Hydro in addressing concerns about load growth by energy-intensive industries and the potential impact that such growth may have with regard to on-peak export sales.

6.3.1 Background to the TOU Proposal

The issue of industrial rate design was last examined in the public hearing process for Manitoba Hydro's Energy Intensive Industrial Rate ("EIIR") Application in December 2008. Concerns about specific aspects of that rate design lead to Manitoba Hydro advancing a revised EIIR proposal in February 2010. However, it became apparent to the Corporation that the EIIR concept still had shortcomings. In October 2010, Manitoba Hydro withdrew its request for implementation of the EIIR and embarked on an engagement process with the Manitoba Industrial Power Users Group ("MIPUG") to develop a more acceptable solution.

Manitoba Hydro consulted with members and representatives of MIPUG between 2010 and 2012 with an objective to develop a mutually acceptable form of rate design that would consider the needs of both Manitoba Hydro and the industrial customers. A TOU rate concept emerged from those discussions as being a reasonable and acceptable approach to rate design for large electrical consumers in Manitoba. The TOU rate design is uniformly applicable to all existing and expanding loads served at 30 kV and over, and is simpler and easier to administer by abandoning the use of complex and controversial baseline calculations and growth allowances.

In order to advance the TOU rate design proposal, in the spring and summer of 2012, Manitoba Hydro held several stakeholder information sessions. Three sessions were conducted, with Winnipeg and rural area large energy users and with registered intervenors, in order to share information on the proposal with interested and affected parties. In September, 2012, the MHEB approved the request to advance the TOU rate design proposal before the PUB in the 2012/13 & 2013/14 General Rate Application. Shortly thereafter, the PUB determined that it would be more appropriate to address the topic of TOU rate design at a later date and deferred its review of the proposal to a future public hearing process.

Manitoba Hydro is of the view that it is appropriate to advance a proposal for TOU rate design in this General Rate Application, and if approved, implement the proposal as of April 1, 2016. The Corporation notes the extensive discussion and engagement with MIPUG and affected GSL customers in the 2010-2012 time frame in the formulation and development of the TOU rate proposal. The features of that original TOU proposal are intact and have been brought forward in the current rate design proposal. The level of the various energy and demand charges have been re-calculated to reflect current revenue requirements and certain adjustments have been made to mitigate the level of billing impact on customers at the transition to the new rate design.

Manitoba Hydro intends to assist customers in transitioning to a new rate design by providing technical and analytical support to identify the resulting cost impacts and reductions available to customers under the proposed changes. Such support may include energy usage analysis and assistance in examining appropriate contract demand levels for optimal effectiveness and control of energy costs.

6.3.2 Features of the TOU Rate Design

The proposed TOU rate design features differentiated energy rates for on-peak and off-peak energy consumption and a single demand charge based upon the maximum demand set during the on-peak period. The resulting energy rates are higher during the on-peak periods (Monday to Friday from 6:00 a.m. to 10:00 p.m. excluding Statutory holidays) and lower during the off-peak periods (all other hours) in comparison to the single block energy charges that are characteristic of the present standard rate design. Energy rates for on-peak periods are further differentiated between winter (December to March inclusive) and all other or "non-winter" months.

In order to design an appropriate on-peak energy price signal while at the same time maintaining revenue neutrality for the rate class, the following issues were considered.

- The relationship to average MISO market pricing was considered in order to reflect marginal cost considerations in the establishment of the appropriate rate level.
- The level of on-peak energy rates was considered and set to be more reflective of on-peak export market pricing typical of firm sales arrangements than would otherwise be possible through the present standard rate design.
- The level of rate differentiation between on-peak and off-peak energy was considered in order to provide sufficient price differentiation to encourage customer response.
- The balance between recovery through energy charges and demand charges was considered primarily to address bill impacts and customer receptiveness to the introduction of a new rate design.

Each of these factors is taken into consideration in the determination of the level of the on-peak and off-peak energy price and the relative amount of revenue to be recovered between energy charges and demand charges.

The relationship of on-peak and off-peak pricing was examined with consideration for the long-term relationship of on and off peak prices in the day-ahead MISO market experienced at the MHEB node. An examination of the ten year average of MISO day-ahead prices indicates the ratio of on-peak to off-peak prices is approximately 1.8. In other words, on-peak prices, on average, were 1.8 times higher than the off-peak price over the ten year period.

This relationship was used to establish the differentiation between the on-peak (non-winter) price and the off-peak price. On-peak prices for the winter season were then set at a level approximately one cent per kWh higher than the non-winter seasonal rate, which is intended to recognize a higher value of capacity during the winter season, recognizing that Manitoba Hydro is a winter peaking utility and that capacity in the winter months has more value.

6.3.3 Calculation of the TOU rate proposed for April 1, 2016

In order to calculate TOU rates for April 1, 2016, a set of proxy 2016 rates were calculated that conform to the present standard rate design. The TOU rates (as shown in Appendix 6.4) are based on revenue neutrality to the present standard rate design. The proxy rates were created by applying the 3.95% rate increase for April 1, 2016 to the proposed April 1, 2015 rates. This results in the following proxy rates:

- Large >100 kV sub-class would have an Energy Charge of $0.03252 per kWh and Demand Charge of $6.35 per kV.A.
- Large 30-100 kV sub-class would have an Energy Charge of $0.03356 per kWh and Demand Charge of $7.14 per kV.A.

With consideration of the energy rate setting factors discussed in the above section, and based upon the level of revenues proposed to be recovered in fiscal year 2016, the energy and demand rates were calculated for GSL 30-100 kV and GSL > 100 kV subclasses. The resulting proposed on-peak and off-peak energy rates for those sub-classes are shown in the following table:

Figure 6.3 Proposed On-Peak and Off-Peak Energy Rates General Service Large Customers

	Large >100kV	Large 30-100kV
On-peak (winter)	$0.0570	$0.0590
On-peak (non-winter)	$0.0470	$0.0486
Off-peak (all)	$0.0260	$0.0270

In order for the TOU rates to be revenue-neutral compared to the present rate structure, the proposed demand charges have been reduced by 35% to 45% relative to the standard rate design demand charges. This adjustment in the recovery between demand and energy charges is also useful in mitigating the initial bill impact to customers transitioning to the TOU rate design.

Consequently, the TOU Demand Charge has been set at approximately 55% of the $6.35 shown above for the Large >100 kV class or $3.50; and 65% of the $7.14 for the Large 30-100 kV class or $4.64.

6.3.4 Proposed Changes to Demand Ratchet Levels

In addition to the proposed implementation of TOU rates, Manitoba Hydro proposes to change the level of the ratchet used to determine the GSL 30-100kV and GSL>100kV sub-class minimum billing demand. Manitoba Hydro is proposing to change the definition of billing demand for these sub-classes to be the greatest of (in kVA):

- The highest measured on-peak demand in the month; or
- 50% of the contract demand; or,
- 50% of the highest on-peak demand in the previous 12 months.

The intent of raising the ratchet levels is to encourage customers to make efficient use of the transmission and sub-transmission system that is built to serve them.

Manitoba Hydro is contractually obligated to provide power up to the level of each customer's contract demand. In some cases, a customer's contract demand level may be significantly more than the actual peak demand experienced by that customer. Historically, there has not been a significant cost for a customer to contract for more capacity than required, as the 25% contract demand ratchet is relatively low.

Manitoba Hydro is concerned that unused capacity, reserved by customers through their specified contract demand levels, may limit the Corporation's ability to serve new and/or expanding load with existing transmission infrastructure, resulting in potential costs for new infrastructure that would not be required if unused capacity was released. Manitoba Hydro's current General Service Large rate structure includes a minimum monthly billing demand charge that is defined as the highest of actual recorded demand, 25% of contract demand or 25% of the highest recorded demand in the past 12 months. The existing billing threshold provides minimal incentive for most large customers to reduce their contracted demand levels if significant contracted capacity remains unused.

6.3.5 Changes to GSL>30kV Rate Design and Bill Impacts

While the TOU rate is designed to be revenue neutral from a customer class perspective, it is recognized that the introduction of a new rate design will result in a range of customer impacts within the GSL 30-100 kV and GSL > 100 kV sub-classes, due to the difference in hourly energy consumption patterns between customers in the same sub-class. Within each sub-class, some customers that will experience lower annual bills and others will experience higher annual bills compared to the present rate design, which is directly related to each individual customer's energy usage pattern. Manitoba Hydro has taken measures to address the billing impacts of transitioning to a new rate design, as set out below.

The proposed change to the demand ratchet level will have a billing impact on a small number of customers that are currently operating at demand levels that are significantly lower than their contracted demand. Manitoba Hydro is addressing those impacts by offering to re-contract those customers at lower demand levels that are more aligned with their current operating characteristics.

The TOU rate proposal filed with the 2012/13 & 2013/14 General Rate Application resulted in higher bill impacts to a small number of customers in the GSL 30-100 sub-class, due to the pattern of their energy usage. Those impacts have been mitigated in this TOU rate proposal, by rebalancing the revenue recovery between demand and energy charges. This was accomplished by lessening the amount of revenue forecast to be recovered through the energy charge and increasing the amount of revenues to be recovered through the demand component of the rate design for the sub-class.

The bill impacts arising from the introduction of the TOU rate design and the 50% demand ratchet are shown in the figure below. Customers experiencing bill impacts of greater than 5% are those with existing contract demand levels significantly exceeding their current operating demand levels, and will have ample opportunity to realign their contract demand levels to mitigate the severity of those bill impacts.

Figure 6.4 Customer Bill Impact Related to Rate Design and Demand Ratchet Change

Customer Bill Impact Related to Rate Design Change
2016 Proxy Rates vs 2016 Proposed TOU Rates
(Including 50% Contract Demand)

	Number of Customers	
	Large 30 - 100 kV	Large >100 kV
Decrease >5%	1	4
Decrease 3% - 5%	1	1
Decrease 1% - 3%	12	3
Increase or Decrease <1%	8	3
Increase 1% -3%	5	1
Increase 3% - 5%	3	0
Increase >5%	8	2
Total Customers	**38**	**14**

6.4 PROPOSED CHANGES TO RATE PROGRAMS

6.4.1 Surplus Energy Program ("SEP")

Manitoba Hydro is seeking confirmation of the rate approval process given proposed change to the Terms and Conditions for Option 1 of the SEP which was proposed in the last GRA, and approved on an interim basis in Order 43/13. This change would allow customers to have a different Reference Demand for each of the three pricing periods. The highest designated Reference Demand would be used in determining the customer's monthly billed demand.

The change would allow eligible General Service Medium and Large customers to nominate different levels of Surplus Energy Program energy purchases in peak periods (5x8 weekdays – day time), off-peak periods (7x8 weekdays – night time), and shoulder periods (other weekday or weekend periods). These changes would allow customers to tailor their Option 1 purchases to minimize costs and/or maximize purchase effectiveness.

The PUB, in Order 43/13 approved the change on an interim basis, to be reviewed at a future hearing. Manitoba Hydro is requesting it be reviewed in this Application and approved as final. While there are currently no customers on Option 1, this change would open the possibility for customers to consider this Option in the future.

A copy of the amended SEP Terms and Conditions are included in Appendix 6.7.

Each year Manitoba Hydro files an annual report with the PUB on the status of the SEP. The current report covering the period November 1, 2013 to October 31, 2014 is included in Appendix 6.8.

6.4.2 Curtailable Rate Program ("CRP")

Manitoba Hydro is seeking confirmation of the rate approval process given proposed changes to the CRP that were approved on an interim basis in Order 43/13.

The following changes were implemented effective May 1, 2013, on an interim basis, pending final approval.

- Cap limitations for CRP load has been reduced to 50 MW for Option R load (from the previous 100 MW) and 180 MW for Option A and C loads (previously 230 MW), assuming that the Option C load will convert to Option A. Should Option C load revert to firm service, then the cap for Option A will be reduced to 150 MW.
- Customer's ability to designate varying monthly curtailable load amounts is no longer available. This feature had never been utilized.
- The previous Terms and Conditions did not allow customers to go back onto the CRP if they have switched their curtailable load to firm service. The interim amended Terms and Conditions allow customers back onto the program provided one year has passed since they went off the program and provided that there is curtailable load available under the cap constraints.
- The "Failure to Curtail" clause has been revised from *"Manitoba Hydro may exclude customers from the Curtailable Rate Program if cumulative additional charges during any contract period equal or exceed cumulative discounts"* to *"Manitoba Hydro may exclude customers from the Curtailable Rate Program if a second or subsequent failure to curtail occurs in any twelve month period."*

The following two changes have not yet been implemented:

- A change in the defined hours for peak and off-peak periods to correspond to the hours being defined for a potential TOU rate offering.
- Curtailment Options "C" and "CE" will no longer be made available. The one customer under Option C (there are no customers on Option CE) will be allowed to remain on this Option for one year from the date of confirmation of the rate approval process associated with the amendments of the CRP Terms and Conditions by the

PUB (the sunset date). The customer will have the ability to switch their curtailable load to Option A provided they do so prior to the sunset date, otherwise their curtailable load will convert to firm service.

On May 15, 2013, Manitoba Hydro advised the PUB that these two changes could not be implemented on an interim basis as they could not be easily reversed. Manitoba Hydro proposed to defer these two changes until such time as the PUB could grant final approval. By letter dated June 25, 2013, the PUB confirmed Manitoba Hydro's approach. Copies of both letters have been provided in Appendix 6.9 to this Tab for reference.

A copy of the CRP Terms and Conditions are included as Appendix 6.10.

Each year Manitoba Hydro files an annual report with the PUB on the status of the CRP. The current report which was filed with the PUB on September 10, 2014 covers the period April 1, 2013 to March 31, 2014 and is included for reference in Appendix 6.11.

Manitoba Hydro is seeking confirmation that the PUB accepts the rates flowing from the changes to the terms and conditions of the SEP and CRP programs that were approved on an interim basis in Order 43/13.

6.5 COST OF SERVICE STUDY AND STAKEHOLDER ENGAGEMENT

Manitoba Hydro last filed a COSS with the PUB in the course of the 2012/13 & 2013/14 General Rate Application, to support its application for the differentiation of rates by customer class to be effective April 1, 2013. Shortly thereafter, the PUB determined that matters associated with the COSS would be heard at a separate regulatory proceeding to be scheduled at a later date. Order 43/13, flowing from the 2012/13 & 2013/14 GRA, approved the increase in rates to be applied on an "across the board" basis to all rate components for all rate classes, effective May 1, 2013.

In 2014, after the conclusion of the "Needs For and Alternatives To" Review of Manitoba Hydro's Preferred Development Plan, the Corporation determined that in light of the significant Generation and Transmission expansion plans and the resulting Recommendations to Government that there was a need to re-examine certain elements of the COSS given this changing environment.

This examination involved internal staff and an external expert, Christensen Associates ("CA") of Madison, Wisconsin undertaking to re-visit certain aspects of the COSS. This initiative also incorporated the use of a stakeholder engagement process to solicit input and alternatives from stakeholders in advance of finalizing its corporate position on these matters.

The purpose of the stakeholder engagement process was to facilitate the sharing of views of COSS methodology in an informal, non-adversarial environment, and to identify possible alternative treatments. This process was also necessitated by the lapse of time since the COSS was last reviewed in a public forum in 2008, and the significant differences in perspectives between Manitoba Hydro and its stakeholders on various COSS assumptions, flowing from Order 116/08.

Manitoba Hydro began planning discussions with stakeholder representatives in August, 2014, which led to the formulation of two workshop sessions that were conducted on October 30, 2014 and December 12, 2014. The workshops were attended by stakeholder representatives and their expert COSS consultants and PUB staff and its engineering technical advisor.

The main topics of discussion in the workshop sessions were:

- Allocation of costs to the export class;
- Treatment of net export revenues;
- Allocation of Demand Side Managements costs;
- Functionalization, classification and allocation of Generation system costs; and,
- Functionalization, classification and allocation of AC Transmission system costs.

The workshops served to provide stakeholders and PUB staff and advisors with a common understanding of Cost of Service matters and presented the parties with the current state of Manitoba Hydro's COSS (PCOSS14). Through the course of each workshop, Manitoba Hydro was able to obtain comments and perspectives from stakeholders on various COSS assumptions and alternative treatments to be considered in future cost of service studies.

Manitoba Hydro intends to assess the input and commentary provided during the workshop sessions and is of the view that this information will be useful in its examination of its COSS. The Corporation will continue its examination of its COSS with a goal of advancing its next COSS for public review at an appropriate time that will be determined in conjunction with the PUB and stakeholders.

6.6 COMPARISON OF ELECTRICITY RATES ACROSS JURISDICTIONS

Figure 6.5 below provides a comparison of the rate increases approved and proposed by other Canadian electric utilities since 2007.

Figure 6.5 Utility Rate Changes

	2007	2008	2009	2010	2011	2012	2013	2014	2015	Cumulative	Current Rate Index*
Manitoba Hydro	2.25%	5.00%	2.90%	2.80%	2.00%	4.40%	3.50%	2.75%	3.95% Proposed	33.7%	100
Hydro Quebec	1.90%	2.90%	1.20%	0.35%	-0.40%	-0.50%	2.41%	4.30%	3.90% Proposed	17.1%	104
BC Hydro	2.10%	0.83%	9.28%	7.29%	7.77%	7.07%	1.44%	9.00%	6.00%	63.2%	134

NS Power	3.80%	0.00%	9.30%	0.00%	6.05%	8.70%	3.00%	3.00%	N/A	38.7%	194

* This index is based on the Edison Electric Institute's Survey and compares the average price per kWh (in Canadian $) for the various utilities. Manitoba Hydro's average price is $0.0627/kWh. The Survey is based on 12 months data ending June 2014.

Manitoba Hydro uses its annual "Survey of Canadian Electricity Bills" (which can be found in Appendix 6.14) to compare bills paid by Manitoba customers with those of other major Canadian utilities. As demonstrated in Figure 6.6 below, based on the 2014 Survey of Canadian Electricity Bills, electricity rates in Manitoba are at or near the low end of rates in comparison to other large Canadian cities.

Figure 6.6 2014 Survey of Canadian Electricity Bills Rate Comparison (Price per kWh)

	Residential		GS – Small		GS - Medium		GS - Large	
	1,000 kWh	2,000 kWh	1,000 kWh	5,000 kWh	120 MWh	200 MWh	5.5 GWh	12 GWh

n/a - did not respond to Manitoba Hydro's survey
Reflects rates in effect May 1, 2014

To measure performance in the overall North American context, Manitoba Hydro uses the results of both the Edison Electric Institute ("EEI") survey as well as monthly statistics obtained from the United States Department of Energy ("DOE"). Unlike the EEI data that provides investor-owned utility comparisons, the DOE data provides comparisons by State which includes numerous utilities within that state. The table below provides the Total Retail Average Rate compared to other low-cost jurisdictions and neighbouring utilities, including primary MISO states, based on the June 2014 DOE data and July 1, 2014 EEI data, using an exchange rate of 1 US $ =1.1423 Canadian as of December 5, 2014.

The Average Retail Rate provided in Figure 6.7 was determined by dividing the combined total revenue billed by the combined total kilowatt hours billed for the 12-month period ending June 30, 2014 for all customer classes (residential, commercial and industrial), whereas the price per kilowatt hour in Figure 6.6, based on Manitoba Hydro's Survey of Canadian Electricity Bills, are provided for each customer class based on specific levels of consumption.

Figure 6.7 Total Retail Average Rate (Canadian $)

State / Province	Cents per kWh
Manitoba	6.27
Quebec	6.51
Washington	7.78
British Columbia	8.39
West Virginia	8.74
Wyoming	8.94
Saskatchewan	9.33
Idaho	9.38
Arkansas	9.39
Kentucky	9.60
South Dakota	10.78
North Dakota	10.84
Minnesota	11.58
Wisconsin	12.70

Electric utilities across Canada are facing similar cost pressures as Manitoba Hydro which are driving higher than inflationary rate increases. A summary of the reasons for proposed rate increases of comparable Canadian utilities is provided below.

In its 10 year plan for BC Hydro, the British Columbia government established electricity rate increases for BC Hydro of 9.0% in 2014 and 6.0% in 2015. The rate increases for 2016, 2017 and 2018 have been capped by the BC government at 4%, 3.5% and 3.0% respectively. The actual rate increases for 2016-2018 will be established by the British Columbia Utilities Commission. The main driver behind these rate increases is the need to fund investments in aging and new infrastructure to meet growing demand. BC Hydro is forecasting a significant increase in electricity demand over the next 20 years, driven by population increases and broad economic expansion, including increased demand associated with Liquefied Natural Gas industry development. Over the next 10 years, BC Hydro forecasts that capital expenditures will amount to approximately $1.7 billion per year. This level of capital investment will be required to refurbish, upgrade, and expand the electricity generation, transmission and distribution system.

The Saskatchewan Rates Review Panel, approved a rate increase for SaskPower of 5.5% effective January 1, 2014. A further rate increase of 3% was implemented effective January 1, 2015. The rate increases are required primarily to support load growth over the next decade, and to support investments in aging generation, transmission and distribution infrastructure. SaskPower is investing an estimated $1 billion per year over the long term to renew and modernize its electricity system. The majority of the increase in SaskPower's expenses in 2014 and 2015 (depreciation & amortization expense, finance expense and capital taxes) are being driven by increased capital investment. Other drivers include increased fuel and power purchase costs associated with changes in SaskPower's generation mix.

Nova Scotia Power's rates increased by 3% in each of 2013 and 2014. The rate increases were set as part of a rate stabilization plan whereby a portion of the revenue requirement not recovered through current rates is being deferred for recovery in future years. In absence of a rate stabilization plan, the rate increases would have been 7.2% in 2013 and 2.8% in 2014. The main drivers of the rate increases were reduced load, infrastructure additions and upgrades, and increases in fuel costs. Nova Scotia Power's two largest customers (both in the pulp and paper industry) shut down in 2012. Moreover, total sales to other customers have also declined. Throughout 2013 and 2014, Nova Scotia Power made investments in renewable energy projects including a biomass plant, and wind farms. In addition, increased capital investments in the distribution and transmission systems were required to improve reliability and prepare the system to receive intermittent renewable energy.

The Regie de l'energie approved an average rate increase of 4.3% for Hydro-Quebec effective April 1, 2014, applicable to all customer classes except the large industrial customer class. The rate increase authorized for the large industrial customer class was 3.5%. The key drivers of rate increases for Hydro-Quebec are the purchasing costs of wind energy, and the costs associated with upgrading the distribution and transmission networks. On August 1 2014, Hydro-Quebec submitted its 2015-2016 distribution rate application. The total requested rate increase is 3.9% for all customer classes, except for the large industrial customer class for which the requested rate increase is 3.5%.

In November 2013, the Ontario government released its 2013 Long Term Energy Plan (the "Plan"), which outlines Ontario's plans for encouraging conservation and providing for a clean, reliable and affordable energy future. The Plan provides residential electricity bill forecasts over the period 2013-2032. Although these are not based on underlying proposed rate increases by a particular entity, they do indicate that Ontario residential and industrial customers could see their bills increase over the 2014 to 2018 time period. For residential customers, electricity bills are estimated to increase by approximately 9.6% in 2014, 5.8% in 2015,15% in 2016,1.8% in 2017, and 4.7% in 2018. Furthermore, Ontario industrial customers could see their electricity bills increase by approximately 10% in 2014, 5.7% in 2015, 4.3% in 2016, 4.2% in 2017, and 5.0% in 2018.

The issue of aging infrastructure is facing all utilities in North America and is resulting in considerably higher rate increases than are being projected in Manitoba. For this reason, even with the rate increases being projected in IFF14, it is expected that Manitoba's domestic electricity customers will continue to have rates that are affordable and competitive with other utilities in North America.

Despite having competitive rates, Manitoba Hydro acknowledges that bill increases have an impact on customers. As discussed in Tab 8, Manitoba Hydro, as part of its Power Smart suite, offers programs to assist customers in managing their energy consumption through the implementation of energy efficiency opportunities in their homes and businesses. These opportunities not only result in energy bill savings in the short and long term, but also result in a more comfortable environment for customers. Moreover, to assist low-income customers, Manitoba Hydro continues to provide targeted and enhanced support through its Affordable Energy Program, to improve the energy efficiency of their homes resulting in lower energy bills and increased comfort.

PROOF OF REVENUE

Current May 1, 2014 Rates vs Proposed April 1, 2015 Rates

Annualized for year ended March 31, 2016

	Calculated Revenue Current Rate	Calculated Revenue Prop. Rate	Diff. in Revenue Dollars	Diff. in Revenue Percent

PROPOSED

RATE SCHEDULES

TO BE EFFECTIVE

APRIL 1, 2015

Manitoba Hydro

TABLE OF CONTENTS

DEFINITIONS

All Rates Schedules in the publication are applied on a MONTHLY basis except as noted.

The following expressions shall have the following meanings:

a) "Basic Charge": a fixed charge that that does not change with the amount of electricity used. This includes the direct costs of metering, portions of the distribution system, as well as billing administration.

b) "Billing Demand": The greatest of the following (expressed in kVA)
   i. measured demand; or
   ii. 25 % of contract demand; or
   iii. 25% of the highest measured demand in the previous 12 months.

c) "Billing Month": the period of time, generally 30 days, in which Energy and/or Demand is consumed and thereafter billed to the Customer.

d) "Demand": the maximum use of power within a specified period of time.

e) "Demand Charge": that portion of the charge for electric service based upon the electric capacity (kVA) consumed and billed on the basis of the billing demand under an applicable rate schedule.

f) "Energy": power integrated over time and measured or expressed in kilowatt-hours (kWh).

g) "Energy Charge": that portion of the charge for electric service based upon the electric energy (kWh) consumed or billed.

h) "Kilo-Volt Amperes (kVA)": also referred to as apparent power, is the product of the volts times current of a circuit divided by 1000. It is composed of both real and reactive power.

i) "Kilowatt Hour (kWh)": the basic unit of electric energy equal to one kilowatt of power supplied to or taken from an electric circuit steadily for one hour.

j) "Measured Demand": the highest demand recorded in the Billing Month.

k) "Power Factor": is the ratio of real power (kW) to apparent power (kVA) for any given load and time. Generally it is expressed as a percentage ratio.

l) "Watt (W)": the electrical unit of power or rate of doing work; the rate of energy transfer equivalent to one ampere flowing under a pressure of one volt at unity power factor.

RESIDENTIAL RATES

RESIDENTIAL - *TARIFF NO. 2015-01*

Basic Charge:	$ 7.57
PLUS	
Energy Charge:	
All kWh	@ 7.672¢ / kWh
Minimum Bill:	$ 7.57

Services over 200 amps will have $7.57 added to the Basic Charge.

Applicability:

The Residential rate is applicable for all residential purposes as follows:

a) individually metered single family dwellings including those in multiple residential projects and single or three phase farm operations served through the same meter if:

   i. the connected business load does NOT exceed 3 kW; or
   ii. the combined agricultural and residential load does NOT exceed a demand of 50 kW.

b) services for personal use outside the home, such as residential water wells, private garages, boat houses and swimming pools (use can be for household, recreational and hobby activities).

c) single metered multiple residential projects meeting all the following criteria:

   i. monthly demand does not exceed 50 kVA;
   ii. the meter serves four or less individual suites or dwelling units;
   iii. none of the units are used for business purposes;
   iv. individual dwelling units are:
      - self-contained rental apartments with common facilities; or
      - row housing with self-contained rental dwelling units and common facilities; or
      - buildings with condominium type dwellings incorporated under *the Condominium Act*; or individual residential services within a trailer park established prior to May 1, 1969.

RESIDENTIAL RATES

SEASONAL - *TARIFF NO. 2015-02*

Annual Basic Charge:	$ 90.84
PLUS	
Energy Charge:	
All kWh	@ 7.672 ¢ / kWh
Minimum Annual Bill:	$ 90.84

The account is billed twice a year, April and October, each for a six-month period. The April billing is for the Annual Basic Charge plus past winter season's consumption. The October billing is for the summer season's consumption only.

Applicability:

The Seasonal rate is applicable to customers outside of the Winnipeg area using less than 7,500 kWh per season and is for residential purposes on an individually metered service when usage is of a casual or intermittent nature.

DIESEL - *TARIFF NO. 2015-03*

Basic Charge:	$ 7.57
PLUS	
Energy Charge:	
All kWh	@ 7.672 ¢ / kWh
Minimum Bill:	$ 7.57

Applicability:

The Residential rate applies to all residential services in the Diesel Communities, provided the service capacity does not exceed 60 A, 120/240 V, single phase.

PLUS	
Demand Charge:	
First 50 kVA of Monthly Billing Demand	No Charge
Balance of Billing Demand	@ $ 9.45 / kVA

Minimum Bill:
Demand Charge PLUS Basic Charge

Accounts where the Monthly Billing Demand is 50 kVA or less within the past 12-month period, ALL energy in excess of 11,000 kWh will be charged @ 5.594 ¢ / kWh.

Primary metering of multiple Utility-Owned transformation services has an additional 2% added to the kVA for each transformation greater than one. There is also a 1% reduction on recorded demand and energy to account for transformer losses.

Applicability:

The General Service Small Rate is applicable to:

a) service with Utility-Owned transformation for all non-residential purposes including churches, community clubs and other community service and recreation facilities and all commercial and general purposes wherein the conduct of business activities or operation is associated with the distribution of goods and/or services.

b) occupied dwellings where the connected business load exceeds 3 kW to not exceeding 200 kW.

c) single metered multiple residential projects meeting any of the following criteria:

    i. monthly demand exceeds 50 kVA to not exceeding 200 kVA ; or
    ii. the meter serves five or more individual suites or dwelling units; or
    iii. any of the units are used for business purposes.

d) farm services:

    i. without an occupied dwelling being used for agricultural or commercial purposes; or
    ii. where the connected business load exceeds 3 kW to not exceeding 200 kW; or
    iii. where the combined agricultural and residential load exceeds a demand of 50 kVA to not exceeding 200 kVA.

Demand Charge PLUS Basic Charge

Monthly Billing Demand *

The greatest of the following (expressed in kVA):

a) measured demand; or
b) 25 % of contract demand; or
c) 25% of the highest measured demand in the previous 12 months.

Primary metering of multiple Utility-Owned transformation services has an additional 2% added to the kVA for each transformation greater than one. There is also a 1% reduction on recorded demand and energy to account for transformer losses.

Applicability:

The General Service Medium rate is applicable to services where the registered demand exceeds 200 kVA and where the transformation is provided by the Corporation.

Customers who, by nature of their business, do not require service during the months of December, January, and February may qualify for the General Service Short-Term Power rate. For further details see page 16.

GENERAL SERVICE

Short-Term Power Rate

The General Service Short-Term application is available throughout the Province of Manitoba except in the Diesel Zone, for customers with services exceeding 200 kVA who, by the nature of their business, do not require service during the months of December, January, and February. Qualifying customers will be billed at, and subject to the conditions of, the appropriate General Service Medium or Large rate.

Services must be disconnected from 00:00 hours, December 1 to 24:00 hours, February 28/29. Customers may use up to a maximum of 1,000 kWh during these months for security purposes only (i.e. alarm system, security lighting) but must notify Manitoba Hydro each year in advance of their operation shutdown.

Service must be taken for a minimum of four months, normally consecutively, during the period March 1 to November 30. Customers will be subject to the same 25% ratchet provisions as applicable to General Service Medium and Large customers, with the exception that no ratchets will apply for the months of December, January or February unless the customer exceeds the 1,000 kWh per month allowable use during those months.

General Service Short-Term is NOT available in conjunction with other services at the same point of delivery.

Unmetered Services

Billed on the General Service Small Rate Tariff No. 2015-20 or 2015-21:

The Unmetered Service rate is applicable:

a) for non-residential customers where the load is constant and the consumption is consistent and metering is unnecessary or undesirable, specifically including traffic signals, pedestrian walkway lighting, directional traffic signs, hazard flashers, cable television power amplifiers, telephone booths, transit shelters (both heated and unheated), cathodic protection rectifiers (for oil and natural gas pipelines), water gauge wells, highway traffic counters, governmental navigational lights (both nautical and aerial), municipal sirens and Canadian Emergency Measures Organization emergency siren alarms.

b) for existing railway crossings, sign lighting and window lighting. Customers will be required to provide metering facilities if additional load is connected.

c) for services such as fairs, summer midways, television production and welding schools where service is required for less than 30 days.

d) for oil field pumping services connected prior to April 1, 1980 with oil pumping motors of the counter balanced (nodding or piston) type.

GENERAL SERVICE

SHORT-DURATION, INTERMITTENT RATE

TERMS AND CONDITIONS

General

Manitoba Hydro will supply short-duration, intermittent power and energy to customers whose operation requires short periods of high demand combined with overall, very low energy consumption.

The Corporation may regulate timing of the customer's demand requirements so that they do not coincide with other system peak demands.

The Corporation may interrupt the supply at any time, for any length of time and for any reason.

Conditions of Service

Qualifying customers will be billed at, and subject to the conditions of, the appropriate General Service Large or Medium rate with the following provisions:

a) Measured demand will be reduced by 50% for billing purposes.

b) Customers will be assessed a monthly energy entitlement based on a 1% load factor (monthly demand x 0.01 x 730) to be billed at the applicable General Service rate.

c) Energy consumption in excess of the monthly energy entitlement will be billed at a rate equal to 10 times the usual applicable General Service rate.

Customers will be required to enter into a formal contract with Manitoba Hydro. The contract will document the above conditions as well as any others considered necessary due to the nature of a specific service.

Rate Application

The General Service Short-Term, Intermittent rate is available to all customers, except those in the Diesel Rate Zone, to customers qualifying for the General Service Large and General Service Medium rates.

	Flat Rate (Energy and Rental)	Metered (Rental Only)
100 HPS	$ 10.17	$ 7.01
150 HPS	$ 13.47	$ 9.57
175 MV	$ 10.50	$ 7.01
400 MV	$ 17.37	$ 9.57

Applicability:

Sentinel lighting is available for security lighting of private or public areas on a dusk-to-dawn basis throughout the Province of Manitoba. Rental units are intended for continuous year-round service and are not provided on a temporary basis.

Sentinel lighting is available for rental as follows:

a) on a flat rate basis when connected directly to the Manitoba Hydro distribution system; or
b) exclusive of electricity if connected to the customer's metered circuits.

AREA AND ROADWAY LIGHTING

FESTOON LIGHTING - *TARIFF NO. 2015-84*

Connected load @ $0.906/ kW per night of scheduled use:

Minimum Monthly Bill: $ 18.50

Applicability:

The Festoon Lighting rate is applicable only for existing unmetered municipally-owned festoon light strings suspended across streets and public thoroughfares. The customer is required to advise the Corporation prior to any changes in the nights contract for operation and/or the connected lighting kilowatts.

DECORATIVE LIGHTING - *TARIFF NO. 2015-85*

Connected load @ $0.906/kW per night of scheduled use:

Minimum Monthly Bill: $ 18.50

Applicability:

The Decorative Lighting rate is applicable for new and existing unmetered municipally-owned decorative lights on frames or modules mounted on roadway lighting poles or ornamental standards and/or Christmas trees. The customer is required to advise the Corporation prior to any change in the nights contracted for operation and\or the connected lighting kilowatts.

CHRISTMAS LIGHTING - *TARIFF NO. 2015-86*

Connected load @ $0.0723/ kWh.

Applicability:

The Christmas Lighting rate is applicable to the City of Winnipeg Christmas lighting only. The customer is required to advise the Corporation prior to any change in the connected load.

PROPOSED

RATE SCHEDULES

TO BE EFFECTIVE

APRIL 1, 2016

Manitoba Hydro

TABLE OF CONTENTS

DEFINITIONS

All Rates Schedules in the publication are applied on a MONTHLY basis except as noted.

The following expressions shall have the following meanings:

a) "Basic Charge": a fixed charge that that does not change with the amount of electricity used. This includes the direct costs of metering, portions of the distribution system, as well as billing administration.

b) "Billing Demand": The greatest of the following (expressed in kVA)
   i. measured demand; or
   ii. % of contract demand; or
   iii. % of the highest measured demand in the previous 12 months.

c) "Billing Month": the period of time, generally 30 days, in which Energy and/or Demand is consumed and thereafter billed to the Customer.

d) "Demand": the maximum use of power within a specified period of time.

e) "Demand Charge": that portion of the charge for electric service based upon the electric capacity (kVA) consumed and billed on the basis of the billing demand under an applicable rate schedule.

f) "Energy": power integrated over time and measured or expressed in kilowatt-hours (kWh).

g) "Energy Charge": that portion of the charge for electric service based upon the electric energy (kWh) consumed or billed.

h) "Kilo-Volt Amperes (kVA)": also referred to as apparent power, is the product of the volts times current of a circuit divided by 1000. It is composed of both real and reactive power.

i) "Kilowatt Hour (kWh)": the basic unit of electric energy equal to one kilowatt of power supplied to or taken from an electric circuit steadily for one hour.

j) "Measured Demand": the highest demand recorded in the Billing Month.

k) "Power Factor": is the ratio of real power (kW) to apparent power (kVA) for any given load and time. Generally it is expressed as a percentage ratio.

l) "Watt (W)": the electrical unit of power or rate of doing work; the rate of energy transfer equivalent to one ampere flowing under a pressure of one volt at unity power factor.

RESIDENTIAL RATES

RESIDENTIAL - *TARIFF NO. 2016-01*

Basic Charge:	$ 7.87
PLUS	
Energy Charge:	
All kWh	@ 7.975¢ / kWh
Minimum Bill:	$ 7.87

Services over 200 amps will have $7.87 added to the Basic Charge.

<u>Applicability</u>:

The Residential rate is applicable for all residential purposes as follows:

a) individually metered single family dwellings including those in multiple residential projects and single or three phase farm operations served through the same meter if:

  i. the connected business load does NOT exceed 3 kW; or
  ii. the combined agricultural and residential load does NOT exceed a demand of 50 kW.

b) services for personal use outside the home, such as residential water wells, private garages, boat houses and swimming pools (use can be for household, recreational and hobby activities).

c) single metered multiple residential projects meeting all the following criteria:

  i. monthly demand does not exceed 50 kVA;
  ii. the meter serves four or less individual suites or dwelling units;
  iii. none of the units are used for business purposes;
  iv. individual dwelling units are:
    - self-contained rental apartments with common facilities; or
    - row housing with self-contained rental dwelling units and common facilities; or
    - buildings with condominium type dwellings incorporated under *the Condominium Act*; or individual residential services within a trailer park established prior to May 1, 1969.

RESIDENTIAL RATES

SEASONAL - *TARIFF NO. 2016-02*

Annual Basic Charge:	$ 94.44
PLUS	
Energy Charge:	
All kWh	@ 7.975 ¢ / kWh
Minimum Annual Bill:	$ 94.44

The account is billed twice a year, April and October, each for a six-month period. The April billing is for the Annual Basic Charge plus past winter season's consumption. The October billing is for the summer season's consumption only.

Applicability:

The Seasonal rate is applicable to customers outside of the Winnipeg area using less than 7,500 kWh per season and is for residential purposes on an individually metered service when usage is of a casual or intermittent nature.

DIESEL - *TARIFF NO. 2016-03*

Basic Charge:	$ 7.87
PLUS	
Energy Charge:	
All kWh	@ 7.975 ¢ / kWh
Minimum Bill:	$ 7.87

Applicability:

The Residential rate applies to all residential services in the Diesel Communities, provided the service capacity does not exceed 60 A, 120/240 V, single phase.

3,000 / 2,000 W	$ 41.70	$ 55.90

Applicability:

Available only for services continuously energized since November 11, 1969.

GENERAL SERVICE

0 TO NOT EXCEEDING 200 kVA

(Utility-Owned Transformation)

SMALL SINGLE PHASE - *TARIFF NO. 2016-20*

Basic Charge:	$ 21.32
PLUS	
Energy Charge:	
First 11,000 kWh	@ 8.376 ¢ / kWh
Next 8,500 kWh	@ 5.815 ¢ / kWh
Balance of kWh	@ 3.838 ¢ / kWh
PLUS	
Demand Charge:	
First 50 kVA of Monthly Billing Demand	No Charge
Balance of Billing Demand	@ $ 9.82 / kVA

Minimum Bill:
Demand Charge PLUS Basic Charge

SMALL THREE PHASE - *TARIFF NO. 2016-21*

Basic Charge:	$ 30.06
PLUS	
Energy Charge:	
First 11,000 kWh	@ 8.376 ¢ / kWh
Next 8,500 kWh	@ 5.815¢ / kWh
Balance of kWh	@ 3.838 ¢ / kWh
PLUS	
Demand Charge:	
First 50 kVA of Monthly Billing Demand	No Charge
Balance of Billing Demand	@ $ 9.82 / kVA

Minimum Bill:
Demand Charge PLUS Basic Charge

Accounts where the Monthly Billing Demand is 50 kVA or less within the past 12-month period, ALL energy in excess of 11,000 kWh will be charged @ 5.815 ¢ / kWh.

Primary metering of multiple Utility-Owned transformation services has an additional 2% added to the kVA for each transformation greater than one. There is also a 1% reduction on recorded demand and energy to account for transformer losses.

Applicability:

The General Service Small Rate is applicable to:

a) service with Utility-Owned transformation for all non-residential purposes including churches, community clubs and other community service and recreation facilities and all commercial and general purposes wherein the conduct of business activities or operation is associated with the distribution of goods and/or services.

b) occupied dwellings where the connected business load exceeds 3 kW to not exceeding 200 kW.

c) single metered multiple residential projects meeting any of the following criteria:

   i. monthly demand exceeds 50 kVA to not exceeding 200 kVA ; or
   ii. the meter serves five or more individual suites or dwelling units; or
   iii. any of the units are used for business purposes.

d) farm services:

   i. without an occupied dwelling being used for agricultural or commercial purposes; or
   ii. where the connected business load exceeds 3 kW to not exceeding 200 kW; or
   iii. where the combined agricultural and residential load exceeds a demand of 50 kVA to not exceeding 200 kVA.

GENERAL SERVICE

0 TO NOT EXCEEDING 50 kVA

SEASONAL - *TARIFF NO. 2016-22*

Annual Basic Charge:	$ 255.84
PLUS	
First 66,000 kWh	@ 8.376 ¢ / kWh
Balance of kWh	@ 5.815 ¢ / kWh
Minimum Annual Bill:	$ 255.84

SEASONAL THREE PHASE - *TARIFF NO. 2016-27*

Annual Basic Charge:	$ 360.72
PLUS	
First 66,000 kWh	@ 8.376 ¢ / kWh
Balance of kWh	@ 5.815 ¢ / kWh
Minimum Annual Bill:	$ 360.72

The account is billed twice a year, April and October, each for a six-month period. The April billing is for the Annual Basic Charge plus past winter season’s consumption. The October billing is for the summer season’s consumption only.

Applicability:

The General Service Seasonal rate is applicable for businesses outside of the Winnipeg area whose:

a) demand does NOT exceed 50 kVA;
b) usage is of an intermittent or casual nature;
c) consumption is primarily summer time and usage is limited in the winter; and
d) business load is greater than 3 kW in a residence.

MEDIUM - *TARIFF NO. 2016-30*

Basic Charge:	$ 31.73
PLUS	
Energy Charge:	
First 11,000 kWh	@ 8.376 ¢ / kWh
Next 8,500 kWh	@ 5.815 ¢ / kWh
Balance of kWh	@ 3.838 ¢ / kWh
PLUS	
* Demand Charge:	
First 50 kVA of Monthly Billing Demand	No Charge
Balance of Billing Demand	@ $ 9.82 / kVA

Minimum Bill:
Demand Charge PLUS Basic Charge

Monthly Billing Demand *

The greatest of the following (expressed in kVA):

a) measured demand; or
b) 25 % of contract demand; or
c) 25% of the highest measured demand in the previous 12 months.

Primary metering of multiple Utility-Owned transformation services has an additional 2% added to the kVA for each transformation greater than one. There is also a 1% reduction on recorded demand and energy to account for transformer losses.

Applicability:

The General Service Medium rate is applicable to services where the registered demand exceeds 200 kVA and where the transformation is provided by the Corporation.

Customers who, by nature of their business, do not require service during the months of December, January, and February may qualify for the General Service Short-Term Power rate. For further details see page 16.

Minimum Bill: Demand Charge

Energy Charge

On-Peak hours are defined as all hours between 6:00 A.M. to 10:00 P.M. Monday to Friday inclusive excluding statutory holidays.

Off-Peak hours are all hours not considered on-peak hours.

The Winter season includes the months of December to March inclusive.

The Non-Winter season includes all months April to November inclusive.

Monthly Billing Demand **

The greatest of the following (expressed in kVA):

a) on-peak measured demand; or
b) 50% of contract demand; or
c) 50% of the highest measured on-peak demand in the previous 12 months

Applicability:

The General Service Large rate is applicable to services where the transformation is provided by the customer and connected directly to the Corporation's distribution, subtransmission or transmission lines.

Customers who, by nature of their business, do not require service during the months of December, January and February may qualify for the General Service Short-Term Power rate.

GENERAL SERVICE

Short-Term Power Rate

The General Service Short-Term application is available throughout the Province of Manitoba except in the Diesel Zone, for customers with services exceeding 200 kVA who, by the nature of their business, do not require service during the months of December, January, and February. Qualifying customers will be billed at, and subject to the conditions of, the appropriate General Service Medium or Large rate.

Services must be disconnected from 00:00 hours, December 1 to 24:00 hours, February 28/29. Customers may use up to a maximum of 1,000 kWh during these months for security purposes only (i.e. alarm system, security lighting) but must notify Manitoba Hydro each year in advance of their operation shutdown.

Service must be taken for a minimum of four months, normally consecutively, during the period March 1 to November 30. Customers will be subject to the same 25% ratchet provisions as applicable to General Service Medium and Large customers, with the exception that no ratchets will apply for the months of December, January or February unless the customer exceeds the 1,000 kWh per month allowable use during those months.

General Service Short-Term is NOT available in conjunction with other services at the same point of delivery.

Unmetered Services

Billed on the General Service Small Rate Tariff No. 2016-20 or 2016-21:

The Unmetered Service rate is applicable:

a) for non-residential customers where the load is constant and the consumption is consistent and metering is unnecessary or undesirable, specifically including traffic signals, pedestrian walkway lighting, directional traffic signs, hazard flashers, cable television power amplifiers, telephone booths, transit shelters (both heated and unheated), cathodic protection rectifiers (for oil and natural gas pipelines), water gauge wells, highway traffic counters, governmental navigational lights (both nautical and aerial), municipal sirens and Canadian Emergency Measures Organization emergency siren alarms.

b) for existing railway crossings, sign lighting and window lighting. Customers will be required to provide metering facilities if additional load is connected.

c) for services such as fairs, summer midways, television production and welding schools where service is required for less than 30 days.

d) for oil field pumping services connected prior to April 1, 1980 with oil pumping motors of the counter balanced (nodding or piston) type.

GENERAL SERVICE

SHORT-DURATION, INTERMITTENT RATE

TERMS AND CONDITIONS

General

Manitoba Hydro will supply short-duration, intermittent power and energy to customers whose operation requires short periods of high demand combined with overall, very low energy consumption.

The Corporation may regulate timing of the customer's demand requirements so that they do not coincide with other system peak demands.

The Corporation may interrupt the supply at any time, for any length of time and for any reason.

Conditions of Service

Qualifying customers will be billed at, and subject to the conditions of, the appropriate General Service Large or Medium rate with the following provisions:

a) Measured demand will be reduced by 50% for billing purposes.

b) Customers will be assessed a monthly energy entitlement based on a 1% load factor (monthly demand x 0.01 x 730) to be billed at the applicable General Service rate.

c) Energy consumption in excess of the monthly energy entitlement will be billed at a rate equal to 10 times the usual applicable General Service rate.

Customers will be required to enter into a formal contract with Manitoba Hydro. The contract will document the above conditions as well as any others considered necessary due to the nature of a specific service.

Rate Application

The General Service Short-Term, Intermittent rate is available to all customers, except those in the Diesel Rate Zone, to customers qualifying for the General Service Large and General Service Medium rates.

250 LED 4/100' (> 180 – 280 W)	-	$ 24.31

Applicability:

The Area and Roadway rate is available throughout the Province of Manitoba and applies to area and roadway lighting installed by agreement for public authorities.

AREA AND ROADWAY LIGHTING

(NOT available for new installations)

FLOOD LIGHTING RATE - *TARIFF NO. 2016-81:*

Watts	Rate Per Month	
	Shared Pole/Luminaire	Exclusive Pole/Luminaire
100 I	$ 5.59	-
150 I	$ 5.59	$ 11.60
300 I	$ 10.20	-
500 I	$ 13.73	$ 22.47
250 MV	$ 12.64	$ 18.49
400 MV	$ 15.45	$ 20.75
500 Q	$ 21.24	$ 26.91

Applicability:

The Floodlighting rate is applicable for floodlighting services existing prior to April 1, 1976 for lighting of public buildings, structures, monuments, parks, grounds and Department of Highways overhead signs served from the Corporation distribution system where the Corporation owns and maintains the luminaires.

AREA AND ROADWAY LIGHTING

SEASONAL RATE - *TARIFF NO. 2016-82:*

Watts	Rate Per Month	
	Shared Pole/Luminaire	**Exclusive Pole/Luminaire**
70 HPS	$ 8.21	$ 13.48
100 HPS	$ 8.52	$ 14.22
150 HPS	$ 10.45	$ 16.06
250 HPS	$ 13.32	$ 18.51

Applicability:

The Seasonal Area and Roadway Lighting rate is available only outside the City of Winnipeg and is applicable for area and roadway lighting installed by agreement for Municipal Corporation, local government districts, Provincial and Federal Governments.

Lighting will be energized from May 1 to October 31 of each year and will be disconnected from November 1 to April 30.

AREA AND ROADWAY LIGHTING

SENTINEL LIGHTING RATE - *TARIFF NO. 2016-83:*

Watts	Rate Per Month	
	Flat Rate (Energy and Rental)	Metered (Rental Only)
100 HPS	$ 10.54	$ 7.29
150 HPS	$ 14.00	$ 9.95
175 MV	$ 10.91	$ 7.27
400 MV	$ 18.06	$ 9.95

Applicability:

Sentinel lighting is available for security lighting of private or public areas on a dusk-to-dawn basis throughout the Province of Manitoba. Rental units are intended for continuous year-round service and are not provided on a temporary basis.

Sentinel lighting is available for rental as follows:

a) on a flat rate basis when connected directly to the Manitoba Hydro distribution system; or
b) exclusive of electricity if connected to the customer's metered circuits.

AREA AND ROADWAY LIGHTING

FESTOON LIGHTING - *TARIFF NO. 2016-84*

Connected load @ $0.942/ kW per night of scheduled use:

Minimum Monthly Bill: $ 19.23

Applicability:

The Festoon Lighting rate is applicable only for existing unmetered municipally-owned festoon light strings suspended across streets and public thoroughfares. The customer is required to advise the Corporation prior to any changes in the nights contract for operation and/or the connected lighting kilowatts.

DECORATIVE LIGHTING - *TARIFF NO. 2016-85*

Connected load @ $0.942/kW per night of scheduled use:

Minimum Monthly Bill: $ 19.23

Applicability:

The Decorative Lighting rate is applicable for new and existing unmetered municipally-owned decorative lights on frames or modules mounted on roadway lighting poles or ornamental standards and/or Christmas trees. The customer is required to advise the Corporation prior to any change in the nights contracted for operation and\or the connected lighting kilowatts.

CHRISTMAS LIGHTING - *TARIFF NO. 2016-86*

Connected load @ $0.0752/ kWh.

Applicability:

The Christmas Lighting rate is applicable to the City of Winnipeg Christmas lighting only. The customer is required to advise the Corporation prior to any change in the connected load.

25%	$71,782	$74,632	$2,850	3.97%
50%	$103,464	$107,564	$4,100	3.96%
75%	$135,146	$140,496	$5,350	3.96%
100%	$166,828	$173,429	$6,601	3.96%

Bill Comparison

Bill comparisons for the Large >30 kV customer classes incorporate the proposed Time of Use (TOU) rates to be effective April 1, 2016. For each of the four Load Factor levels, distribution of the energy usage between the four pricing periods (peak, off-peak, winter, non-winter) is based on the overall class average percentages for each of these pricing periods. The impact on individual customers however will vary dependent on their load factor and distribution of their energy use amongst the pricing periods.

The following two tables compare the proposed April 2015 rates to the proposed April 2016 TOU rates. The differences and percentages shown reflect both the 3.95% rate increase as well as the impact of the change in rate design.

General Service Large - 30 kV to 100 kV
10 000 kVA

Forecast Customers: 41

Load Factor	Standard April 1, 2015 $ / Month	TOU April 1, 2016 $ / Month	Difference in $ / Month	Percent Change
25%	$127,611	$116,061	($11,550)	-9.05%
50%	$186,522	$185,722	($800)	-0.43%
75%	$245,433	$255,383	$9,950	4.05%
100%	$304,344	$325,044	$20,700	6.80%

SURPLUS ENERGY PROGRAM

PROPOSED TERMS AND CONDITIONS

Manitoba Hydro

SURPLUS ENERGY PROGRAM
INDUSTRIAL LOAD - OPTION 1
TABLE OF CONTENTS

Page No.

Schedules

SURPLUS ENERGY PROGRAM
INDUSTRIAL LOAD - OPTION 1
TERMS AND CONDITIONS

ELIGIBILITY

1. SEP - Option 1 is available to industrial loads which meet the following qualifications:

   a) Total Demand must be 1 000 kVA or greater. Total Demand is defined as the Reference Level of Demand (as described in Section 3 below) **plus** the level of Demand associated with SEP; and

   b) Demand associated with SEP does not exceed 50 MVA **except** where the load factor of such load is guaranteed by the customer, in writing, to exceed 25% on a weekly basis; and

   c) Are not being served under the Curtailable Rate Program; and

   d) Manitoba Hydro may require a customer to maintain a minimum Power Factor of 90% as a condition of participation.

REFERENCE DEMAND

2. A customer shall designate a Reference Level of Demand (both in kV.A and kW) for each calendar month of the year. Customers have the option of designating different Reference Demands for each TOU periods (Peak, Shoulder, Off-Peak). The Reference Demand is subject to the following:

   a) The designation must be made prior to participation in SEP; and

   b) The Reference Level of Demand must equal at least 75% of Total Demand

      - *Exception*: Manitoba Hydro may allow exceptions to the 75% qualification, where a customer can demonstrate, to the satisfaction of Manitoba Hydro, that it has on-site back-up capability in the form of a generating facility or alternative equipment capable of supporting the process to which SEP is applied and, that, the back-up capability together with the Reference Level of Demand can supply 75% or more of the Total Demand; and

3. Subject to Subsections 3 b) and c), a customer may increase its designated Reference Level of Demand or may convert part or all of the load served under SEP to firm service by providing Manitoba Hydro with advance written notice based on the following notice period options, of which, must be determined and designated on Schedule ‘A’ of the customer’s SEP contract prior to participation in SEP. In all cases Manitoba Hydro may reduce the notice period if, in its sole discretion such reduction can be accomplished without adverse impact to the operations or revenues of the corporation.

a) A 12 month notice period with an option of:

   i) the customer will pay a premium of 1.0¢ per kWh for energy purchased during the summer peak hours; or

   ii) the customer will agree that load converted on 12 months notice shall be subject to curtailment under the provisions of Option "A" or "R" of the Curtailable Rate Program for the first four months following the conversion; or

b) A notice period dependent on when the said notice is provided, as follows:

   i) where notice is provided between September 1 up to and including January 31, a 12 month notice period shall apply; or

   ii) where notice is provided between February 1 up to and including April 30, a 16 month notice period shall apply. Where the customer provides notice between February 1 and April 30, the customer may elect at the time notice is given, to convert to the notice provisions outlined in Subsection 4 a) ii) above; or

   iii) where notice is provided between May 1 up to and including August 31, the notice period shall not expire prior to August 31 of the following year such that notice will be not greater than 16 months or less than 12 months. Where the customer provides notice between May 1 and August 1, the customer may elect, at the time notice is given, to convert to the notice provisions outlined in Subsection 4 a) ii) above.

BILLING

4. Energy Charges:

SEP energy is energy associated with the demand taken by a customer in excess of the monthly Reference Level of Demand(s) (in kW). Measurement of SEP energy will be based on each 15-minute interval reading of kW during a billing month.

Rates to SEP - Option 1 customers will be set as follows. The rates which will be charged are set out in Schedule SEP-1 (attached) and are subject to weekly approval by the PUB as per Schedule SEP-2 (attached).

a) i) a Basic Charge of $100.00 per month to cover administration and metering costs;

   ii) an Energy Charge per kWh which will be set for three Time-of-Use periods on a weekly basis; that is, one for each of the peak, shoulder, and off-peak periods. The periods are defined below:

	Summer (May 1 - October 31)	**Winter (November 1 - April 30)**
Peak	Monday through Friday except Statutory Holidays from: 12:01 hours - 20:00 hours	Monday through Friday except Statutory Holidays from: 07:01 hours - 11:00 hours; and 16:01 hours - 20:00 hours
Shoulder	All hours except Peak, every day from: 07:01 hours - 23:00 hours	
Off-Peak	All night time hours from 23:01 hours - 07:00 hours	

The Weekly Energy Charge will be determined as per Schedule SEP-3 (attached).

iii) a Distribution Charge per kWh intended to collect approximately one-third of the embedded cost of distribution, subtransmission, and regional transmission.

b) All non-SEP energy will be billed at the appropriate standard General Service Large or Medium rate.

5. Demand Charge:

a) The demand up to the maximum monthly Reference Level of Demand in kV.A will be billed at the at the appropriate standard General Service Large or Medium rate, subject to Monthly Billing Demand criteria as set out in Subsection 6 b). In the case of different Reference Level of Demand for the TOU periods, the highest designated monthly TOU Reference Level of Demand will be used.

b) The Monthly Billing Demand in KV.A for a customer participating in SEP is the greatest of the following:

i) measured demand up to a maximum of the monthly Reference Level of Demand in kVA; or

ii) 25% of the highest annual Reference Level of Demand in kV.A

- *Exception:* In the event that a customer's demand exceeds Total Demand as defined in Subsection 2 a), the appropriate standard General Service Large or Medium Demand Charge will apply to all kVA in excess of Total Demand. The Reference Level of Demand plus the demand in excess of Total Demand will be used in determining the Monthly Billing Demand. Manitoba Hydro does not guarantee the supply of firm capacity in excess of the Reference Level of Demand.

INTERRUPTIONS

6. On notice by fax/email or phone from Manitoba Hydro, a customer will be required to reduce its load within 36 hours to its Reference Level of Demand(s) (kW) in one or more of the TOU periods as specified in the notice, and to maintain its load at or below its Reference Level of Demand(s) in the specified period(s) until notified by Hydro by fax/email or phone that the interruption is ended.

   Where the SEP load is separately metered, the customer will be required to interrupt supply to the SEP load.

7. Failure to reduce load to or below the Reference Level of Demand (kW) during an interruption can result in additional charges based on the actual costs Manitoba Hydro incurs to supply any load above the Reference Level of Demand. The maximum additional charge is $150.00 per kW of Demand and $1.00 per kWh of associated energy.

8. A customer will be subject to unplanned interruptions such as those due to under frequency relay operation during power system emergencies. Manitoba Hydro cannot guarantee continuous service to any class of service in Manitoba or extra-provincially.

METERING AND ELECTRIC SERVICE FACILITIES

9. Manitoba Hydro will supply the appropriate metering for a SEP customer.

10. The customer shall be responsible for all costs of building or upgrading regional transmission, subtransmission, distribution and/or dedicated services which may be required to serve SEP load.

CONTRACT REQUIREMENTS

11. A customer will be required to enter into a formal agreement with Manitoba Hydro. The agreement will document the above Terms and Conditions as well as any others considered necessary due to the nature of a specific service.

CUSTOMER WAIVER – NO BACK-UP FACILITIES REQUIRED

12. Where no back-up facilities are required as per Subsection 3 b), a customer will be required to sign a waiver stating that:

    a) The customer has included in its Reference Level of Demand sufficient kV.A/kW for all essential load within its operation.

    b) The customer understands that the Terms and Conditions of SEP provide for:

       i) SEP energy prices-per-kWh which can be volatile from week-to-week, and can be extremely high during periods of scarcity in interconnected markets; and

ii) interruption in the supply of SEP energy can be initiated by Manitoba Hydro on 36 hours notice to the customer for any reason; and

iii) possible lengthy periods of interruption.

c) The customer has considered the implications of the foregoing and will comply without objection to interruptions made in accordance with the Terms and Conditions of SEP.

CUSTOMER WAIVER – BACK-UP FACILITIES REQUIRED

13. Where back-up facilities are required as per Subsection 3 b):

a) A customer will be required to sign a waiver as per Subsections 13 b) and c).

b) The customer must provide certification in writing to Manitoba Hydro that:

i) the back-up facility is adequate to serve that portion of SEP load in excess of 25% of Total Demand, given the type of load and possibly lengthy interruption of SEP supply; and

ii) the installation and operation of the back-up facility complies with all government regulations including all municipal and provincial zoning and environmental regulations.

c) Certification of back-up as described in Subsections 14 b) i) and ii) must be provided in writing to Manitoba Hydro when the customer first accepts SEP service and by no later than October 1, of every year thereafter that the customer is accepting SEP service.

d) If a customer ceases, or is unable to maintain an adequate back-up facility:

i) the customer must notify Manitoba Hydro in writing of the situation immediately; and

ii) the customer must reduce its Total Demand to the Reference Level of Demand(s); and

iii) should the customer continue to use SEP, Manitoba Hydro may bill the customer for Demand (kV.A) associated with SEP energy use at the applicable General Service Large or Medium Demand Charge for the period of time the back-up facility is considered to be, or to have been, inadequate; and

iv) notice to convert load served under SEP to firm service will be as set out in Section 4.

Off-Peak	All night time hours from 23:01 hours - 07:00 hours	

SURPLUS ENERGY PROGRAM
PROCEDURE FOR INTERIM EX PARTE
PUBLIC UTILITIES BOARD (PUB) APPROVAL OF SEP RATE

---

1. Each Wednesday by 9:00 AM Central Time (CT), Manitoba Hydro shall:

   i) email to the Board a copy of Schedule SEP-1 which shall include the Energy Charge for the Time-of-Use periods for all General Service Medium and Large classes of service;

   ii) indicate the expected source of SEP energy (i.e. from displaced exports, Manitoba Hydro generation, or imports); and

   iii) warrant that the price has been estimated using approved methodology as set out in Schedule SEP-3.

   The "Delivered Microsoft Outlook" message for the email will serve as confirmation that the PUB has received the schedule.

2. If Schedule SEP-1 is acceptable, the PUB will provide interim *ex parte* approval of the rates and email the Interim *Ex Parte* Order to Manitoba Hydro by 2:00 PM CT the same day. If the proposed Schedule, for any reason, is not acceptable, the PUB will contact Manitoba Hydro as soon as possible and attempt to resolve any concerns. If these concerns cannot be resolved by Wednesday at 3:00 PM CT, Manitoba Hydro will then forthwith contact customers to inform them that SEP energy is not available for the following week.

3. If the PUB emails an Interim *Ex Parte* Order to Manitoba Hydro by 2:00 PM CT on Wednesday, Manitoba Hydro shall fax/email the approved rate schedule to the SEP customers by 3:00 PM CT the same day.

4. Steps 1 through 3 shall be repeated each Wednesday that SEP energy is available.

SURPLUS ENERGY PROGRAM
PROCEDURE FOR DETERMINATION OF
WEEKLY ENERGY CHARGE

The SEP Energy Charge for each of the three Time-of-Use (TOU) periods shall be determined by Manitoba Hydro weekly, on a forecast basis for the following week (Monday through Sunday), as follows:

- If SEP energy displaces extra-provincial sales, the Energy Charge shall be such as to collect the revenue that would have been received from the foregone energy sales from the week to which the Energy Charge applies.

- If SEP energy is provided from purchased power, the Energy Charge shall be the amount necessary to recover the cost of the purchased power, including Transmission Service Charges, Administration Fees and Losses, plus 10% as a contribution to reserves.

- If SEP energy is provided from Manitoba Hydro generation, the Energy Charge shall be the amount necessary to collect the incremental cost of generation including Transmission Losses, plus 10% as a contribution to reserves. The latter is to administer energy and to cover a small share of fixed cost or contribution to reserves.

- In forecasting the weekly energy prices, Manitoba Hydro will consider what price experience has been under similar conditions of seasonality, expected demand and supply in the Midwest Independent Transmission System Operator (MISO) Market. An adder will be applied to each of the three TOU periods to account for market volatility or unforeseen supply costs. The adders will be adjusted as required to ensure a balance is maintained over the long-term between actual energy costs and revenues from SEP energy.

SURPLUS ENERGY PROGRAM
HEATING LOAD - OPTION 2

TABLE OF CONTENTS

Page No.

SURPLUS ENERGY PROGRAM
HEATING LOAD - OPTION 2
TERMS AND CONDITIONS

ELIGIBILITY

1. SEP - Option 2 is available to heating loads which meet the following qualifications:

   a) Demand must be 200 kW or greater; and

   b) The electricity is to be used for space and/or water heating only; and

   c) The load must be metered separately from the customer's firm load; and

   d) The customer has an alternate energy source as a back-up facility for the entire SEP load; and

   e) Demand associated with SEP does not exceed 50 MVA **except** where the load factor of such load is guaranteed by the customer, in writing, to exceed 25% on a weekly basis; and

   f) The load is not being served under the Curtailable Rate Program.

CONVERSION TO FIRM SERVICE

2. A customer may convert part or all of the load served under SEP to firm service by providing Manitoba Hydro with advance written notice based on the following notice period options, of which, must be determined and designated on Schedule 'A' of the customer's SEP contract prior to participation in SEP. In all cases Manitoba Hydro may reduce the notice period if, in its sole discretion such reduction can be accomplished without adverse impact to the operations or revenues of the corporation.

   a) A 12 month notice period with an option of:

      i) the customer will pay a premium of 1.0¢ per kWh for energy purchased during the summer peak hours; or

      ii) the customer will agree that load converted on 12 months notice shall be subject to curtailment under the provisions of Option "A" or "R" of the Curtailable Rate Program for the first four months following the conversion; or

   b) A notice period dependent on when the said notice is provided, as follows:

      i) where notice is provided between September 1 up to and including January 31, a 12 month notice period shall apply; or

ii) where notice is provided between February 1 up to and including April 30, a 16 month notice period shall apply. Where the customer provides notice between February 1 and April 30, the customer may elect at the time notice is given, to convert to the notice provisions outlined in Subsection 3 a) ii) above; or

iii) where notice is provided between May 1 up to and including August 31, the notice period shall not expire prior to August 31 of the following year such that notice will be not greater than 16 months or less than 12 months. Where the customer provides notice between May 1 and August 1, the customer may elect, at the time notice is given, to convert to the notice provisions outlined in Subsection 3 a) ii) above.

BILLING

3. Rates to SEP - Option 2 customers will be set as follows. The rates which will be charged are set out in Schedule SEP-1 (attached) and are subject to weekly approval by the PUB as per Schedule SEP-2 (attached).

a) i) a Basic Charge to cover administration and metering costs as follows:

- For loads of 1 000 kV.A or greater $100.00 per month
- For loads of less than 1 000 kV.A $50.00 per month

ii) An Energy Charge per kWh which will be set for three Time-of-Use periods on a weekly basis; that is, one for each of the peak, shoulder, and off-peak periods. The periods are defined below:

	Summer (May 1 - October 31)	**Winter (November 1 - April 30)**
Peak	Monday through Friday except Statutory Holidays from: 12:01 hours - 20:00 hours	Monday through Friday except Statutory Holidays from: 07:01 hours - 11:00 hours; and 16:01 hours - 20:00 hours
Shoulder	All hours except Peak, every day from: 07:01 hours - 23:00 hours	
Off-Peak	All night time hours from 23:01 hours - 07:00 hours	

The Weekly Energy Charge will be determined as per Schedule SEP-3 (attached).

iii) a Distribution Charge per kWh intended to collect approximately one-third of the embedded cost of distribution, subtransmission, and regional transmission.

INTERRUPTIONS

4. On notice by fax/email or phone from Manitoba Hydro, a customer will be required to interrupt electricity supply to the SEP load within 36 hours in one or more of the TOU periods as specified in the notice, and may not resume use of SEP in the specified period(s) until notified by Hydro by fax/email or phone that the interruption is ended.

5. Failure to interrupt SEP load during an interruption can result in additional charges based on the actual costs Manitoba Hydro incurs to supply SEP load during an interruption. The maximum additional charge is $150.00 per kW of Demand and $1.00 per kWh of associated energy.

6. A customer will be subject to unplanned interruptions such as those due to under frequency relay operation during power system emergencies. Manitoba Hydro cannot guarantee continuous service to any class of service in Manitoba or extra-provincially.

METERING AND ELECTRIC SERVICE FACILITIES

7. Manitoba Hydro will supply the appropriate metering for a SEP customer.

8. The customer shall be responsible for all costs of building or upgrading regional transmission, subtransmission, distribution and/or dedicated services which may be required to serve SEP load.

CONTRACT REQUIREMENTS

9. A customer will be required to enter into a formal agreement with Manitoba Hydro. The agreement will document the above Terms and Conditions as well as any others considered necessary due to the nature of a specific service.

CUSTOMER WAIVER

10. a) A customer will be required to sign a waiver stating that the customer understands that the Terms and Conditions of SEP provide for:

    i) SEP energy prices-per-kWh which can be volatile from week-to-week, and can be extremely high during periods of scarcity in interconnected markets; and

    ii) interruption in the supply of SEP energy can be initiated by Manitoba Hydro on 36 hours notice to the customer for any reason; and

    iii) possible lengthy periods of interruption

    b) The customer has considered the implications of the foregoing and will comply without objection to interruptions made in accordance with the Terms and Conditions of SEP.

c) The customer must provide certification in writing to Manitoba Hydro that:

   i) the back-up facility is adequate to serve the entire SEP load given the type of load and possibly lengthy interruption of SEP supply; and

   ii) the installation and operation of the back-up facility complies with all government regulations including all municipal and provincial zoning and environmental regulations.

d) Certification of back-up as described in Subsections 11 c) i) and ii) must be provided in writing to Manitoba Hydro when the customer first accepts SEP service and by no later than October 1, of every year thereafter that the customer is accepting SEP service.

e) If a customer ceases, or is unable to maintain an adequate back-up facility:

   i) the customer must notify Manitoba Hydro in writing of the situation immediately; and

   ii) should the customer continue to use SEP, Manitoba Hydro may bill the customer for Demand (kVA) associated with SEP energy use at the applicable General Service Large or Medium Demand Charge for the period of time the back-up facility is considered to be, or to have been, inadequate. The appropriate SEP Energy and Distribution Charges will continue to be applied to all energy use; and

   iii) Notice to convert load served under SEP to firm service will be as set out in Section 3.

SURPLUS ENERGY PROGRAM
PROCEDURE FOR INTERIM EX PARTE
PUBLIC UTILITIES BOARD (PUB) APPROVAL OF SEP RATE

---

1. Each Wednesday by 9:00 AM Central Time (CT), Manitoba Hydro shall:

   i) email to the Board a copy of Schedule SEP-1 which shall include the Energy Charge for the Time-of-Use periods for all General Service Medium and Large classes of service;

   ii) indicate the expected source of SEP energy (i.e. from displaced exports, Manitoba Hydro generation, or imports); and

   iii) warrant that the price has been estimated using approved methodology as set out in Schedule SEP-3.

   The "Delivered Microsoft Outlook" message for the email will serve as confirmation that the PUB has received the schedule.

2. If Schedule SEP-1 is acceptable, the PUB will provide interim *ex parte* approval of the rates and email the Interim *Ex Parte* Order to Manitoba Hydro by 2:00 PM CT the same day. If the proposed Schedule, for any reason, is not acceptable, the PUB will contact Manitoba Hydro as soon as possible and attempt to resolve any concerns. If these concerns cannot be resolved by Wednesday at 3:00 PM CT, Manitoba Hydro will then forthwith contact customers to inform them that SEP energy is not available for the following week.

3. If the PUB emails an Interim *Ex Parte* Order to Manitoba Hydro by 2:00 PM CT on Wednesday, Manitoba Hydro shall fax/email the approved rate schedule to the SEP customers by 3:00 PM CT the same day.

4. Steps 1 through 3 shall be repeated each Wednesday that SEP energy is available.

SURPLUS ENERGY PROGRAM
PROCEDURE FOR DETERMINATION OF
WEEKLY ENERGY CHARGE

The SEP Energy Charge for each of the three Time-of-Use (TOU) periods shall be determined by Manitoba Hydro weekly, on a forecast basis for the following week (Monday through Sunday), as follows:

- If SEP energy displaces extra-provincial sales, the Energy Charge shall be such as to collect the revenue that would have been received from the foregone energy sales from the week to which the Energy Charge applies.

- If SEP energy is provided from purchased power, the Energy Charge shall be the amount necessary to recover the cost of the purchased power, including Transmission Service Charges, Administration Fees and Losses, plus 10% as a contribution to reserves.

- If SEP energy is provided from Manitoba Hydro generation, the Energy Charge shall be the amount necessary to collect the incremental cost of generation including Transmission Losses, plus 10% as a contribution to reserves. The latter is to administer energy and to cover a small share of fixed cost or contribution to reserves.

- In forecasting the weekly energy prices, Manitoba Hydro will consider what price experience has been under similar conditions of seasonality, expected demand and supply in the Midwest Independent Transmission System Operator (MISO) Market. An adder will be applied to each of the three TOU periods to account for market volatility or unforeseen supply costs. The adders will be adjusted as required to ensure a balance is maintained over the long-term between actual energy costs and revenues from SEP energy.

SURPLUS ENERGY PROGRAM
SELF-GENERATION DISPLACEMENT - OPTION 3
TERMS AND CONDITIONS

ELIGIBILITY

1. SEP - Option 3 is available to electric loads which meet the following qualifications:

   a) Demand must be between 200 kW and 50 000 kW; and

   b) The load must be fully backed up by generating equipment which is leased or owned by the customer and is located on the premises of the SEP load; and

   c) The load is intermittent and for industrial use which can be deferred, for several days, if necessary, should maintenance of back-up generation be required during a period of interruption of SEP energy supply.

      Load would not be considered intermittent if the average monthly load factor exceeds 25%; and

   d) The load must be metered separately from the customer's firm load; and

   e) The load is not being served under the Curtailable Rate Program; and

   f) Manitoba Hydro may require a customer to maintain a minimum Power Factor of 90% as a condition of participation.

CONVERSION TO FIRM SERVICE

2. A customer may convert part or all of the load served under SEP to firm service by providing Manitoba Hydro with advance written notice based on the following notice period options, of which, must be determined and designated on Schedule 'A' of the customer's SEP contract prior to participation in SEP. In all cases Manitoba Hydro may reduce the notice period if, in its sole discretion such reduction can be accomplished without adverse impact to the operations or revenues of the corporation.

   a) A 12 month notice period with an option of:

      i) the customer will pay a premium of 1.0¢ per kWh for energy purchased during the summer peak hours; or

      ii) the customer will agree that load converted on 12 months notice shall be subject to curtailment under the provisions of Option "A" or "R" of the Curtailable Rate Program for the first four months following the conversion; or

b) A notice period dependent on when the said notice is provided, as follows:

i) where notice is provided between September 1 up to and including January 31, a 12 month notice period shall apply; or

ii) where notice is provided between February 1 up to and including April 30, a 16 month notice period shall apply. Where the customer provides notice between February 1 and April 30, the customer may elect at the time notice is given, to convert to the notice provisions outlined in Subsection 3 a) ii) above; or

iii) where notice is provided between May 1 up to and including August 31, the notice period shall not expire prior to August 31 of the following year such that notice will be not greater than 16 months or less than 12 months. Where the customer provides notice between May 1 and August 1, the customer may elect, at the time notice is given, to convert to the notice provisions outlined in Subsection 3 a) ii) above.

BILLING

3. Rates to SEP - Option 3 customers will be set as follows. The rates which will be charged are set out in Schedule SEP-1 (attached) and are subject to weekly approval by the PUB as per Schedule SEP-2 (attached).

a) i) a Basic Charge to cover administration and metering costs as follows:

- For loads of 1 000 kV.A or greater $100.00 per month
- For loads of less than 1 000 kV.A $50.00 per month

ii) an Energy Charge per kWh which will be set for three Time-of-Use periods on a weekly basis; that is, one for each of the peak, shoulder, and off-peak periods. The periods are defined below:

	Summer (May 1 - October 31)	**Winter (November 1 - April 30)**
Peak	Monday through Friday except Statutory Holidays from: 12:01 hours - 20:00 hours	Monday through Friday except Statutory Holidays from: 07:01 hours - 11:00 hours; and 16:01 hours - 20:00 hours
Shoulder	All hours except Peak, every day from: 07:01 hours - 23:00 hours	
Off-Peak	All night time hours from 23:01 hours - 07:00 hours	

The Weekly Energy Charge will be determined as per Schedule SEP-3 (attached).

iii) a Distribution Charge per kWh intended to collect approximately one-third of the embedded cost of distribution, subtransmission, and regional transmission.

INTERRUPTIONS

4. On notice by fax/email or phone from Manitoba Hydro, a customer will be required to interrupt electricity supply to the SEP load within 36 hours in one or more of the TOU periods as specified in the notice, and may not resume use of SEP in the specified period(s) until notified by Hydro by fax/email or phone that the interruption is ended.

5. Failure to interrupt SEP load during an interruption can result in additional charges based on the actual costs Manitoba Hydro incurs to supply SEP load during an interruption. The maximum additional charge is $150.00 per kW of Demand and $1.00 per kWh of associated energy.

6. A customer will be subject to unplanned interruptions such as those due to under frequency relay operation during power system emergencies. Manitoba Hydro cannot guarantee continuous service to any class of service in Manitoba or extra-provincially.

METERING AND ELECTRIC SERVICE FACILITIES

7. Manitoba Hydro will supply the appropriate metering for a SEP customer.

8. The customer shall be responsible for all costs of building or upgrading regional transmission, subtransmission, distribution and/or dedicated services which may be required to serve SEP load.

CONTRACT REQUIREMENTS

9. A customer will be required to enter into a formal agreement with Manitoba Hydro. The agreement will document the above Terms and Conditions as well as any others considered necessary due to the nature of a specific service.

CUSTOMER WAIVER

10. a) A customer will be required to sign a waiver stating that the customer understands that the Terms and Conditions of SEP provide for:

i) SEP energy prices-per-kWh which can be volatile from week-to-week, and can be extremely high during periods of scarcity in interconnected markets; and

ii) interruption in the supply of SEP energy can be initiated by Manitoba Hydro on 36 hours notice to the customer for any reason; and

iii) possible lengthy periods of interruption.

b) The customer has considered the implications of the foregoing and will comply without objection to interruptions made in accordance with the Terms and Conditions of SEP.

c) The customer must provide certification in writing to Manitoba Hydro that:

  i) the back-up facility is adequate to serve the entire SEP load given the type of load and possibly lengthy interruption of SEP supply; and

  ii) the installation and operation of the back-up facility complies with all government regulations including all municipal and provincial zoning and environmental regulations.

d) Certification of back-up as described in Subsections 11 c) i) and ii) must be provided in writing to Manitoba Hydro when the customer first accepts SEP service and by no later than October 1, of every year thereafter that the customer is accepting SEP service.

e) If a customer ceases, or is unable to maintain an adequate back-up facility:

  i) the customer must notify Manitoba Hydro in writing of the situation immediately; and

  ii) should the customer continue to use SEP, Manitoba Hydro may bill the customer for Demand (kVA) associated with SEP energy use at the applicable General Service Large or Medium Demand Charge for the period of time the back-up facility is considered to be, or to have been, inadequate. The appropriate SEP Energy and Distribution Charges will continue to be applied to all energy use; and

  iii) notice to convert load served under SEP to firm service will be as set out in Section 3.

SURPLUS ENERGY PROGRAM
PROCEDURE FOR INTERIM EX PARTE
PUBLIC UTILITIES BOARD (PUB) APPROVAL OF SEP RATE

---

1. Each Wednesday by 9:00 AM Central Time (CT), Manitoba Hydro shall:

   i) email to the Board a copy of Schedule SEP-1 which shall include the Energy Charge for the Time-of-Use periods for all General Service Medium and Large classes of service;

   ii) indicate the expected source of SEP energy (i.e. from displaced exports, Manitoba Hydro generation, or imports); and

   iii) warrant that the price has been estimated using approved methodology as set out in Schedule SEP-3.

   The "Delivered Microsoft Outlook" message for the email will serve as confirmation that the PUB has received the schedule.

2. If Schedule SEP-1 is acceptable, the PUB will provide interim *ex parte* approval of the rates and email the Interim *Ex Parte* Order to Manitoba Hydro by 2:00 PM CT the same day. If the proposed Schedule, for any reason, is not acceptable, the PUB will contact Manitoba Hydro as soon as possible and attempt to resolve any concerns. If these concerns cannot be resolved by Wednesday at 3:00 PM CT, Manitoba Hydro will then forthwith contact customers to inform them that SEP energy is not available for the following week.

3. If the PUB emails an Interim *Ex Parte* Order to Manitoba Hydro by 2:00 PM CT on Wednesday, Manitoba Hydro shall fax/email the approved rate schedule to the SEP customers by 3:00 PM CT the same day.

4. Steps 1 through 3 shall be repeated each Wednesday that SEP energy is available.

SURPLUS ENERGY PROGRAM
PROCEDURE FOR DETERMINATION OF
WEEKLY ENERGY CHARGE

The SEP Energy Charge for each of the three Time-of-Use (TOU) periods shall be determined by Manitoba Hydro weekly, on a forecast basis for the following week (Monday through Sunday), as follows:

- If SEP energy displaces extra-provincial sales, the Energy Charge shall be such as to collect the revenue that would have been received from the foregone energy sales from the week to which the Energy Charge applies.

- If SEP energy is provided from purchased power, the Energy Charge shall be the amount necessary to recover the cost of the purchased power, including Transmission Service Charges, Administration Fees and Losses, plus 10% as a contribution to reserves.

- If SEP energy is provided from Manitoba Hydro generation, the Energy Charge shall be the amount necessary to collect the incremental cost of generation including Transmission Losses, plus 10% as a contribution to reserves. The latter is to administer energy and to cover a small share of fixed cost or contribution to reserves.

- In forecasting the weekly energy prices, Manitoba Hydro will consider what price experience has been under similar conditions of seasonality, expected demand and supply in the Midwest Independent Transmission System Operator (MISO) Market. An adder will be applied to each of the three TOU periods to account for market volatility or unforeseen supply costs. The adders will be adjusted as required to ensure a balance is maintained over the long-term between actual energy costs and revenues from SEP energy.

TABLE OF CONTENTS

REPORT TO PUBLIC UTILITIES BOARD
SURPLUS ENERGY PROGRAM
NOVEMBER 1, 2013 - OCTOBER 31, 2014

BACKGROUND

The Surplus Energy Program ("SEP") was first approved on June 30, 2000 by Public Utilities Board ("PUB") Order No. 90/00. The program is intended to enable customers to purchase surplus energy at market prices that are determined on a weekly basis for peak, shoulder, and off-peak periods. Customers began accepting service under the Terms and Conditions of this temporary program on December 4, 2000. Manitoba Hydro filed an Application on April 5, 2012 requesting minor modifications to SEP Option 1, as well as to make SEP a permanent rate offering. These proposals were subsequently included in Manitoba Hydro's 2012/13 and 2013/14 General Rate Application ("GRA"). At the conclusion of the GRA hearing, the PUB issued Board Order 43/13 dated April 26, 2013 which approved SEP Option 1 on an interim basis, and approved Options 2 and 3 as a permanent rate offering. Manitoba Hydro is seeking final approval of the changes to SEP Option 1 Terms and Conditions in its 2015/16 and 2016/17 GRA.

As part of the original Board Order which approved SEP, Manitoba Hydro was directed to file annual reports on the status of the program. This is the 14th report which covers the period November 1, 2013 to October 31, 2014. For a brief history of PUB Orders and Manitoba Hydro's applications and reports with respect to the SEP Program, please see Attachment 1.

SUMMARY OF FINDINGS

The SEP Program is a revenue neutral program that offers customers choice and access to surplus energy at prices that reflect Manitoba Hydro's short term marginal cost of energy. To obtain the full benefits of the program customers need to have sufficient flexibility in their operation to take advantage of lower price periods. While the SEP Program is not intended as a rate discount program, market and Manitoba Hydro supply conditions during the past year were such that all SEP customers experienced reduced bills relative to the respective General Service firm rate they would have otherwise billed under.

The cost to Manitoba Hydro for providing surplus energy to SEP customers during the current one-year reporting period was $1,068,652. Total revenue collected under SEP was $1,055,103 excluding Basic Charges and Distribution Charges, resulting in a net revenue loss to Manitoba Hydro of $13,549.

The main factors that affected SEP prices during the current reporting year were extra-provincial market prices, weather driven electrical load-water conditions, and transmission constraints to neighboring markets. Water conditions during this period were above average. Hydraulic generation through the winter and early spring was above average because there was significant storage carry forward from the previous year. However, persistent below average temperatures in the region resulted in increased domestic electrical demand and added pressure to market prices during the winter months. Colder than normal weather resulted in increased short-term marginal energy costs, particularly from mid-January to mid-February. Inflows were well above average through spring and summer across all basins, and were record high in the Winnipeg River basin, allowing for above average hydraulic generation through the entire reporting period. Spill conditions occurred through the late spring, summer and fall due to high inflows. An extended transmission outage through October 2014 restricted Manitoba Hydro exports and added downward pressure on the SEP rates during this period. Energy is sourced from avoided spill, defined as the water that would have been spilled absent of the SEP during times when tie-lines to neighboring markets are fully utilized and there is unused hydro generation capacity. These factors, combined with a growth in wind generation in the US market, as well as continued low natural gas costs have kept SEP prices generally lower compared to the prices experienced in 2007/08.

The majority (70%) of the Peak SEP energy supply was sourced from displaced exports, while 30% was sourced through avoided spill. For the Shoulder period, 57% was sourced through exports, and 43% through avoided spill. For the Off-Peak period, 51% of energy was sourced through exports, 46% through avoided spill, and 3% was sourced through imports.

Average 2013/14 SEP prices were the 5th lowest of the 14 years the program has been available and were similar to the 2009/10 average prices. Higher average SEP prices were seen from 2000 to 2009. SEP General Service Medium average prices were: On-Peak 4.318 ¢/kWh ranging from 0.426 ¢/kWh to 7.447 ¢/kWh; Shoulder 3.223 ¢/kWh ranging from 0.426 ¢/kWh to 6.299 ¢/kWh; and Off-Peak 1.832 ¢/kWh ranging from 0.426 ¢/kWh to 4.157 ¢/kWh.

There was no interruption in service during the 12 month reporting period.

DESCRIPTION OF PROGRAM

Eligibility:

The Program makes surplus energy available on an interruptible basis to Manitoba Hydro General Service customers. Eligible customers can participate in one of the following three options:

1) Industrial Load - Option 1 - available to industrial loads whose Total Demand is 1,000 kVA or greater. Total Demand is defined as the Reference Level of Demand plus the level of demand associated with SEP. Under this option customers may only designate 25%[1] of their total load as SEP load, with the remaining 75% being their Reference Demand. Manitoba Hydro is proposing changes to the Reference Demand to allow customers to have a different Reference Demand for each of the three pricing periods. The highest designated Reference Demand would be used in determining the customer's monthly billed demand.

2) Heating Load - Option 2 – available to electrical loads of 200 kW or greater. The electricity is to be used for space and/or water heating only and must be separately metered from the customer's firm load. Customers must have an alternate back-up energy source capable of heating the entire load in the event of an interruption.

3) Self-Generation Displacement - Option 3 – available to industrial intermittent loads with total demand between 200 kW to 50,000 kW. Load would not be considered intermittent if the average monthly load factor exceeds 25%. The load must be separately metered from the customer's firm load and must be fully backed up by generating equipment which is leased or owned by the customer and is located on the premises of the SEP load.

Billing:

All SEP customers are billed a monthly Basic Charge, Distribution Charge and an Energy Charge. The Basic Charge is $50.00 per month for customers with connected loads of 1,000 kVA or less, and $100.00 per month for connected loads greater than 1,000 kVA. The Distribution Charge per kilowatt-hour ranges from 0.06¢ to 0.62¢ dependent on customer class. The Energy Charge per kilowatt-hour, applicable to three pricing periods, varies based on

[1] Customers can designate up to 50% of their load as SEP provided they have an alternate back-up source of energy to supply the amount in excess of the 25%.

expected market prices from week-to-week. The three pricing periods are peak, shoulder and off-peak, and are further defined by season as shown in the following table:

	Summer (May 1 – October 31)	**Winter (November 1 – April 30)**
Peak	12:01 to 20:00 hours Monday to Friday Except Statutory Holidays	07:01 to 11:00 hours and 16:01 to 20:00 hours Monday to Friday Except Statutory Holidays
Shoulder	All hours except Peak, every day from 07:01 to 23:00	
Off-Peak	All night time hours from 23:01 to 07:00 hours	

PROGRAM SUBSCRIPTION

There were 28 customers on the SEP program for this reporting period. Of the 28 customers, 25 are Option 2 (Heating Load) and 3 are Option 3 (Self-Generation Displacement). There are no Option 1 (Industrial Load) customers.

All the Option 2 customers are classed as General Service Medium Demand and fall under the following industry types:

Agricultural and Related Service Industries	7 customers
Educational Service Industries	12 customers
Local Government Service Industries	4 customers
Machinery & Equipment	1 customer
Retail Food, Beverage and Drug Industries	1 customer

All the Option 3 customers are in the General Service Large Demand 750 V – 30 kV class under the following industry types:

Quarry & Sand Pit Industries	2 customers
Paper & Allied Products Industries	1 customers

All customers have signed a waiver ensuring they have appropriate back-up facilities to support their loads in the event of an interruption.

POTENTIAL CUSTOMERS

One customer in the welding industry is currently in the process of contracting for SEP. Customers in the agricultural industry who currently use coal are assessing alternate fuel choices and may consider SEP in the future due to the Manitoba government's ban on the use of coal for space and water heating in 2017.

CUSTOMER EXPERIENCE

Manitoba Hydro is not aware of any customer complaints regarding the SEP Program.

There have been no difficulties encountered with communication of pricing information to customers on a timely basis. This information is faxed or emailed to customers on Wednesday of each week, providing prices that will be in place for the following week beginning Sunday at midnight.

SEP ENERGY PRICES

Each Wednesday Manitoba Hydro applies to the Public Utilities Board for interim *ex parte* approval of the SEP Energy Rates to be in effect the following Monday through Sunday. The following table compares the weekly average prices approved by the PUB with the actual average after-the-fact prices throughout the reporting period. Attachment 2 provides the weekly rates for each pricing period for both Medium and Large 750 V - 30 kV classes. The information is also shown graphically on page 7.

SEP - Average Weekly Rate Per MWh				
Week Beginning	**Actual**	**PUB Approved**	**Difference**	**PUB Order No.**
November 1, 2013	$20.79	$19.39	$1.40	131/13
November 4, 2013	$8.21	$17.71	($9.50)	133/13

SOURCE OF SUPPLY FOR SEP ENERGY

As part of its weekly Application to the PUB, Manitoba Hydro is required to indicate the expected source of supply for SEP energy that is used to derive the marginal cost of energy for the weekly SEP energy rates. The following summary table compares the expected source of supply, which was the basis of the weekly Applications, to the actual source of supply as determined after-the-fact. A more detailed analysis by week is provided in Attachment 3.

SEP Energy Supply Source (%)														
November 1, 2013 to October 31, 2014														
	Actual							Forecast						
	Imports			Exports			Avoided Spill	Imports			Exports			Avoided Spill
	Peak	Shoulder	Off-Peak	Peak	Shoulder	Off-Peak		Peak	Shoulder	Off-Peak	Peak	Shoulder	Off-Peak	
Peak	0%	0%	0%	70%	0%	0%	30%	1%	0%	0%	78%	0%	0%	21%
Shoulder	0%	0%	0%	0%	57%	0%	43%	0%	0%	0%	0%	59%	0%	41%
Off-Peak	0%	0%	3%	0%	0%	51%	46%	0%	0%	0%	0%	0%	54%	46%

Water conditions during this reporting period were above average. Hydraulic generation through the winter and early spring was above average because there was significant storage carry forward from the previous year. Inflows were well above average through spring and summer across all basins, and were record high in the Winnipeg River basin, allowing for above average hydraulic generation through the entire reporting period. Spill conditions occurred through the late spring, summer and fall due to high inflows and outages at Manitoba Hydro's interconnection to the United States.

Through-out the reporting period SEP energy was sourced mostly from displaced exports: 70% Peak, 57% Shoulder, and 51% Off-Peak. In January, February and March, 3% of the Off-Peak energy was sourced from imports. Starting in May, the remainder of the energy supply was sourced from avoided spill: 30% Peak, 43% Shoulder, and 46% Off-Peak. Avoided spill occurs during periods when tie-lines to neighboring markets are fully utilized and firm load has been met, combined with unused hydro generation capacity. In general, avoided spill is more frequently experienced during Off-Peak periods due to low over-night Manitoba loads.

ACTUAL SALES

Total energy and revenue of SEP sales over the period November 1, 2013 to October 31, 2014 were 29,371 MWh and $1,230,282 (excluding $19,200 in Basic Charges). The distribution of the energy and revenue by pricing period is shown below. A more detailed analysis by week is provided in Attachments 4, 5 and 6.

Period	SEP Energy Sales MWh	Revenue		
		Distribution Charge	Energy Charge	Total
Peak	6,865	$40,093	$328,178	$368,271
Shoulder	12,812	$76,395	$482,912	$559,307
Off Peak	9,694	$58,692	$244,013	$302,705
Total	**29,371**	**$175,180**	**$1,055,103**	**$1,230,282**

Over the period November 1, 2013 through to October 31, 2014, the value of SEP energy (using after-the-fact prices) was $1,068,652. Revenue from energy sales was $1,055,103 resulting in net revenue loss to Manitoba Hydro of $13,549 for the year. The following table summarizes Manitoba Hydro net revenue for each time-of-use period. A more detailed analysis by week is found in Attachment 7.

SEP Energy Revenues versus Costs				
Period	SEP Energy Sales MWh	SEP Sales*	Value of SEP Energy to Manitoba Hydro	Manitoba Hydro Net Revenue
Peak	6,865	$328,178	$347,343	($19,165)
Shoulder	12,812	$482,912	$451,570	$31,341
Off Peak	9,694	$244,013	$269,738	($25,725)
Total	**29,371**	**$1,055,103**	**$1,068,652**	**($13,549)**

* SEP Sales do not include $175,180 from Distribution Charges or $19,200 from Basic Charges. The value of SEP energy to Manitoba Hydro is calculated by multiplying weekly MWh sales by the actual weekly SEP energy rate at common bus.

YEAR-TO-DATE RESULTS

The following is a summary of the program since its inception on December 4, 2000.

Program Year	Number of Services		
	General Service Medium	GS Large (750 V to 30 kV)	Total
Dec 4, 2000 to Oct 31, 2001	24	4	28
Nov 1, 2001 to Oct 31, 2002	27	6	33
Nov 1, 2002 to Oct 31, 2003	27	6	33
Nov 1, 2003 to Oct 31, 2004	25	6	31
Nov 1, 2004 to Oct 31, 2005	22	6	28
Nov 1, 2005 to Oct 31, 2006	22	6	28
Nov 1, 2006 to Oct 31, 2007	22	5	27

Attachment 1 - SEP: Chronology of PUB Directives, MH Applications, and Reports

PUB Order	Date	PUB Board Findings & MH Applications and Reports Filings
	Oct 25/99	MH files application for approval of the Surplus Energy Program
90/00	Jun 30/00	PUB approves SEP application to March 31, 2004 and directs MH to file annual reports on SEP by no later than January 31 of each year.
	Jul 20/00	MH letter - in response to Board Order 90/00 MH requests variance of 12 month notice provision to range from 12 to 16 months notice.
132/00	Sep 29/00	The PUB varies BO 90/00 such that an SEP customer who chooses to convert to firm service has various notice period options.
	Oct 26/00	MH files revised Terms & Condition of SEP to be in accordance with Board Order 90/00 and 132/00. MH also advises its intent to waive requirement for a Professional Engineer Certification of back-up facilities
143/01	Sep 13/01	The PUB approves the revised Terms and Conditions as noted in MH's letter of Oct 26/00.
	Sep 21/01	MH files revised SEP Terms and Conditions as required by BO 143/01
	Nov 30/01	MH files Report #1 on SEP for period Dec 4/00 to Oct 31/01
	Mar 12/03	MH files Report #2 on SEP for period Nov 1/01 to Oct 31/02
	Mar 24/03	MH - by correspondence requests SEP be extended to Mar 31/05 on ex parte bases.
153/03	Oct 31/03	PUB approves request for extension of SEP to March 31, 2005 on an interim ex parte basis.
	Jan 29/04	As part of 2004 GRA (Appendix 9.2.2, Volume 3) MH requests SEP program be extended two more years to March 31, 2007. MH files Report #3 on SEP for period Nov 1/02 to Oct 31/03
101/04	Jul 28/04	PUB approves MH's application to extend Terms and Conditions of the SEP, as proposed and amended by MH, until March 31, 2007.
	May 17/05	MH files Report #4 on SEP for period Nov 1/03 to Oct 31/04
	Jan 23/06	MH files Report #5 on SEP for period Nov 1/04 to Oct 31/05
	Apr 20/06	MH applies to extend SEP Terms & Conditions to Mar 31/09
	Sep 7/06	PUB issues letter advising they are prepared to extend SEP to Oct 31/07. Also state their intention to review SEP in upcoming MH GRA.
	Sep 28/06	MH letter requests PUB reconsider their position and extend program, at minimum to October 31, 2008, noting customers need to plan for modifications or elimination of SEP and require minimum 12 months notice period.
173/06	Dec 21/06	PUB approves extension of SEP to the earlier of October 31, 2007 or an application to amend by MH. Advises MH to include a review of SEP in its GRA filing, due no later than August 1, 2007.

PUB Order	Date	PUB Board Findings & MH Applications and Reports Filings
	Jan 12/07	MH files Report #6 on SEP for period Nov 1/05 to Oct 31/06
	Aug 1/07	GRA filing - MH requests immediate approval to extend SEP to October 31/08 with final approval to extend the program to March 31/13 as it is expected hearing will not take place until early 2008.
136/07	Oct 26/07	PUB approves extension of SEP to April 30, 2009 on an interim basis, unless amended or extended by a further Order of the Board.
	Feb 5/08	MH files Report #7 on SEP for period Nov 1/06 to Oct 31/07
90/08	Jun 30/08	PUB approves extension of SEP until October 31, 2008, with the application for a further extension to March 31, 2013 to be dealt with in the subsequent Order.
116/08	Jul 29/08	PUB approves extension of the SEP to October 31, 2008; on condition annual reports continue to be provided. Also raises concern with MH's marketing practices that yield extremely low prices for off-peak exports. MH directed to file a report by January 15, 2009 evaluating SEP, including monthly historical data from 2000 to 2008.
	Sep 18/08	MH files application to vary BO 116/08, requesting PUB extend the date for filing of SEP report to February 28, 2009.
150/08	Nov 7/08	PUB agrees to vary deadline date for the SEP report to February 28, 2009 and approves extension of SEP to April 30, 2009. PUB indicates final approval of SEP to March 31, 2013 will follow once receipt and review of the February 28, 2009 SEP Annual Report is complete.
	Mar 4/09	MH files Report #8 on SEP for period Nov 1/07 to Oct 31/08
57/09	Apr 28/09	PUB approves SEP to March 31, 2013
	Mar 11/10	MH files Report #9 on SEP for period Nov 1/08 to Oct 31/09
	May 11/11	MH files Report #10 on SEP for period Nov 1/09 to Oct 31/10
	April 5/12	MH files an application to vary the Terms and Conditions as well as Report #11 on SEP for period Nov 1/10 to Oct 31/11
111/12	Aug 22/12	PUB approved extension of the SEP to March 31, 2014 to allow time for review of the MH's SEP application during MH's 2012/13 and 2013/14 GRA.
	Mar 11/13	MH files Report #12 on SEP for period Nov 1/11 to Oct 31/12
43/13	Apr 26/13	PUB approves Option 1 Terms and Conditions on an interim basis, to be reviewed at a Cost of Service/Time of Use hearing. PUB approves Option 2 and 3 as a permanent rate offering.
	Jan 31/14	MH files Report #13 on SEP for period Nov 1/12 to Oct 31/13

Mr. H. Singh
Executive Director
Public Utilities Board
400-330 Portage Avenue
Winnipeg, Manitoba
R3C 0C4

Dear Mr. Singh:

RE: Public Utilities Board Order 43/13 - Interim Approval of Changes to the Curtailable Rate Program

On April 26, 2013, the Public Utilities Board of Manitoba ("PUB") issued Order 43/13 with respect to Manitoba Hydro's 2012/13 & 2013/14 General Rate Application. In this Order, the PUB approved the following, on an interim basis, with respect to Manitoba Hydro's proposed changes to its Curtailable Rate Program ("CRP"):

> *That Manitoba Hydro's proposed changes to the Curtailable Rate Program BE AND ARE HEREBY APPROVED ON AN INTERIM BASIS, to be reviewed by the Board at a General Rate Application to follow the Needs For And Alternatives To (NFAT) hearing with respect to Manitoba Hydro's Preferred Development Plan.*

Manitoba Hydro wishes to advise the PUB that two of the approved changes to the CRP are difficult to implement on an interim basis, as customer decisions in response to these changes are not easily reversible if these changes are not subsequently approved as final:

- A change in the defined hours for peak and off-peak periods; and,
- Elimination of Curtailment Options "C" and "CE" effective one year from PUB approval (i.e. the sunset date).

As the PUB is not prepared to approve these changes on a final basis at this time, Manitoba Hydro proposes to defer implementation of the change in the defined hours for peak and off-peak periods and the elimination of Options "C" and "CE" until such time as the PUB grants final approval.

Manitoba Hydro intends to implement the other changes to the CRP that were outlined in its Application, and approved by Order 43/13, in the intervening time. Manitoba Hydro notes that it will reduce the global subscription cap on Option "A", but only to the extent that the existing Option "C" load can be accommodated.

Manitoba Hydro is requesting the PUB's confirmation of the forgoing. Should you have any questions with respect to this submission, please do not hesitate to contact the writer at (204) 360-3946.

Yours truly,

June 25, 2013

Ms. Patricia J. Ramage
Law Department
Manitoba Hydro
22nd floor, 360 Portage Avenue
Winnipeg, MB R3C 0G8

Dear Ms. Ramage:

Re: Public Utilities Board Order 43/13 Interim Approval of Changes to the Curtailable Rate Program

The Manitoba Public Utilities Board (Board) has received your letter of May 15, 2013 regarding the Board's interim approval of proposed changes to the Curtailable Rate Program (CRP) as ordered in Board Order 43/13.

In your letter Manitoba Hydro advises that Board that two of the proposed approved changes to the CRP are difficult to implement on an interim basis as customer's decisions in response to these changes are not easily reversible if these changes are not subsequently approved as final. Specifically, Manitoba Hydro highlights the following approved changes as problematic:

- A change in the defined hours for peak and off-peak periods; and'
- Elimination of the Curtailment Options "C" and "CE" effective one year from PUB approval (i.e. the sunset date).

Manitoba Hydro has proposed to defer the above changes until such time as the Board grants final approval to the proposed CRP changes. Manitoba Hydro is seeking the Board's confirmation that deferral of the above proposed changes to the CRP is acceptable to the Board.

The Board appreciates the uncertainty that may be created for CRP customers resulting from the Board's interim approval to the proposed CRP changes from Order 43/13. The Board therefore confirms Manitoba Hydro's proposed approach to defer the implementation of the above-referenced changes to the CRP program until such time as the Board grants final approval.

Yours truly,

CURTAILABLE RATE PROGRAM

FOR INDIVIDUAL CUSTOMER LOADS

PROPOSED

TERMS AND CONDITIONS

Manitoba Hydro

January 2015

TABLE OF CONTENTS

CURTAILABLE RATE PROGRAM
TERMS AND CONDITIONS

1. DEFINITIONS

The following expressions when used in these Terms and Conditions shall have the following meanings:

a) **"Billing Month"**: the period of time, generally 30 days, in which Energy and/or Demand is consumed and thereafter billed to the Customer.

b) **"Contingency"**: the unexpected failure or outage of a system component, such as a generator, transmission line, circuit breaker, switch or other electrical element.

c) **"Contingency Reserves"**: a component of Operating Reserves which are sufficient in magnitude and response and meet the North American Electric Reliability Corporation's (NERC) disturbance control standards. Contingency reserves are comprised of spinning and supplemental reserves.

d) **"Curtailment"**: a reduction in the use of Energy by the customer, as initiated by Manitoba Hydro.

e) **"Curtailment Period"**: for Option 'A' and 'R' customers, defined as the time from which Manitoba Hydro gives the customer the "notice to curtail" to the time the "notice to restore" is given; for Option 'C' customers, defined as the time from which Manitoba Hydro gives the customer the "notice to curtail" plus one full hour to the time the "notice to restore" is given; for Option 'E' customers, from the start and stop times specified on the customer fax to curtail and restore load.

f) **"Curtailment Year"**: the 12-month period commencing upon implementation of the Terms and Conditions of the Curtailable Rate Program by Manitoba Hydro once approved by the Public Utilities Board.

g) **"Demand"**: the maximum use of power within a specified period.

h) **"Disturbance":** An unplanned event that produces an abnormal system condition; a perturbation to the electric system; or an unexpected change in the supply-demand balance that is caused by the sudden failure of generation or interruption of load.

i) **"Energy"**: power integrated over time and measured or expressed in kilowatt-hours (kWh).

j) **"Firm Load"**: load that is not considered interruptible (curtailable).

k) **"Interruption"**: discontinuance in the supply of Energy.

l) **"Load Factor"**: the ratio of a customer's average Demand over a designated period of time to the Customer's maximum Demand occurring in that period. Monthly Load Factor is found by calculating the ratio of Energy use (kWh) to highest Demand (kW) multiplied by time (usually measured at 730 hours):

$$LF = \frac{\text{Energy (kWh per month)}}{\text{Peak Demand (kW) x hours per month}}$$

m) **"MISO-MBHydro Contingency Reserve Sharing Group" or "MISO-MBHydro CRSG":** The Midwest Independent Transmission System Operator Inc. (MISO) and Manitoba Hydro balancing authorities collectively maintain, allocate, and supply operating reserves required for each entities' use in recovering from Contingencies or Disturbances on the transmission systems operated by either party. The group is established under the coordination agreement between MISO and Manitoba Hydro.

n) **"Point of Delivery":** the point at which the Corporation delivers electricity and beyond which electric service facilities (excluding meters and metering transformers) are supplied by and are the responsibility of the customer.

o) **"Power Factor":** the ratio of real power in watts of an alternating current circuit to the apparent power in volt-amperes, expressed as kW/kV.A.

p) **"Protected Firm Load (PFL)"**: the amount of load (expressed in kW) that the customer wishes to protect from being curtailed.

q) **“Peak”**: defined as all hours from 6:01 hours through 22:00 hours Monday through Friday inclusive excluding Statutory holidays

r) **“Off-Peak”**: all nighttime hours from 22:01 hours through 06:00 hours Monday through Sunday inclusive, and all hours from 0:01 hours to 24:00 hours on Saturdays, Sundays and Statutory holidays.

s) **“Operating Reserves”**: That capability above firm system demand required to provide for regulation, load forecasting error, equipment forced and scheduled outages and local area protection. It consists of Spinning Reserves and Supplemental Reserves.

t) **“Operating Reserve - Spinning”**: The portion of Operating Reserve consisting of: generation synchronized to the system and fully available to serve load within the NERC defined disturbance recovery period following the Contingency or Disturbance event; or load fully removable from the system within the disturbance recovery period following the Contingency or Disturbance event.

u) **“Operating Reserve - Supplemental”**: The portion of Operating Reserves consisting of: generation (synchronized or capable of being synchronized to the system) that is fully available to serve load within the NERC defined disturbance recovery period following a Contingency or Disturbance event; or load fully removable from the system within the disturbance recovery period following a Contingency or Disturbance event.

v) **“Planning Reserves”**: The reserves needed to ensure that future load obligations at times of peak demand do not exceed supply resources.

w) **“Reference Discount”:** An amount credited to the customer each month for having Planning and/or Contingency Reserve load available.

x) **“Reserve Discount”**: An amount credited to the customer for energy curtailed each time Supplemental Reserve load is deployed under Option R.

2. CURTAILABLE LOAD OPTIONS

The following curtailable load options are available, however are subject to capacity limitations and durations as noted in Section 6:

Option 'A': Curtail within five minutes of notice for a maximum of four hours and 15 minutes per curtailment period.

Option 'C': Curtail within one hour of notice for a maximum of four hours per curtailment period.

Option 'R': Curtail within five minutes of notice for a maximum of four hours and 15 minutes per curtailment period.

Option 'E': Curtail within 48 hours of notice for a maximum of 10 days per curtailment period.

Additional description of limits on curtailments (e.g. maximum curtailments per year) is provided on Page 13.

Options 'A', 'C' or 'R' cannot be combined with each other but may be combined with Option 'E' to increase the discount. The terms and conditions of combined Options 'AE', 'CE' and 'RE' are combinations of the individual options (e.g. notice to curtail for 'AE' would be five minutes for Option 'A' curtailments and 48 hours for Option 'E' curtailments).

Customers may elect to designate part of their load as Option 'A' and another part of their load as Option 'R' provided the loads designated under each option are distinct from each other. Although the customer designates a specific portion of their load as Option 'R', Manitoba Hydro's System Operator may request a curtailment of less than the amount designated by the customer. The minimum load the Manitoba Hydro System Operator can request under Option 'R' is 5,000 kW. Manitoba Hydro will make best efforts to request a curtailment equal to the customer's contracted amount.

3. NOMINATION OF CURTAILABLE LOAD

A customer must have a minimum, nominal curtailable load of 5 MW. Customers have two options of nominating eligible curtailable load however customers designating curtailable load under Option 'R' must nominate the "Guaranteed Curtailment" option.

(i) Guaranteed Curtailment

A customer selecting this option must guarantee availability 95%[1] of the time during each curtailment year. Manitoba Hydro reserves the right to exclude customers from future participation in the program should they fail to meet this guaranteed requirement. The customer is required to nominate curtailable load equal to the amount of which is guaranteed to be reduced at the time requested. For example, a customer with a total load of 100 MW may nominate 10 MW as curtailable load and guarantee that when requested that 10 MW of load (or lesser amount if requested by Manitoba Hydro System Operator) will be shed. In order to honour this guarantee, the customer will be required to ensure that its load prior to curtailment would be such that it never falls below 10 MW plus whatever Firm Load the customer wishes to protect.

In the event the Customer is unable to have the full amount of guaranteed curtailable load available for dispatch, the Customer must provide Manitoba Hydro 48 hours verbal notice of an anticipated plant shutdown and must also notify Manitoba Hydro immediately of any unanticipated unavailability of curtailable load. The customer shall immediately notify Manitoba Hydro when the curtailable load is again available. Failure to do so will result in the same penalties as failure to curtail as outlined in Section 10.

For this customer, the Reference Discount is determined in accordance with the following formula:

Monthly Credit = GC x $/kW Credit for selected option where,

GC = the customer's guaranteed curtailable load

NOTE: The monthly credit will not be applied if a customer fails to provide guaranteed curtailable load for a period greater than 10% of the hours in the

[1] The 95% availability means the customer must guarantee their designated curtailable load will be available for curtailment a minimum of 8,322 hours (8,760 hours x 95%) each curtailment year.

applicable calendar month. For example, a customer would have to have their guaranteed load available for a minimum of 648 hours in a 30-day month and 670 hours in a 31-day month. This will ensure that customers are not being paid a credit when they are shutdown for extended periods of time. The customer is still required however to maintain the 95% per year availability criteria as specified above.

(i) Curtail to Protected Firm Load

The customer nominates a Protected Firm Load below which curtailment will not occur. The curtailable portion of the customer load will be the load available above the Protected Firm Load at the time of curtailment request. With this type of nomination, there is a risk to Manitoba Hydro that there will be little or no load to curtail when a request is made: i.e. that the customer is operating at or below protected firm level when curtailment request is made.

For this customer, the Reference Discount is determined in accordance with the following formula:

Monthly Credit = (PD-PFL) x LF x $/kW Credit for Selected Option where,

PD = the customer's highest demand (kW) in the Peak billing period in the billing month.

PFL = Protected Firm Load of the customer in kW.

LF = is the customer's overall load factor during the Peak billing period in the billing month and excluding any days during which the customer complied with a curtailment request.

At Manitoba Hydro's discretion customers with load factors less than 50% during Peak periods on the curtailable portion of the load may be required to guarantee curtailable load, i.e. to take up Option 3(i).

4. CURTAILABLE RATE DISCOUNT

A Curtailable customer's bill is reduced by the curtailable load discount, calculated in accordance with the "Reference Discount" appropriate to the curtailment option selected by the customer and the formula for determining curtailable load.

Customers selecting Curtailment Option ‘R’ will, in addition to the Reference Discount, receive a “Reserve Discount” amount for each curtailment initiated and successfully completed. The Reserve Discount credit will be calculated based on the following formula:

Reserve Discount = LR x Du x FD, where

LR = amount of load reduction (in kW) requested by Manitoba Hydro’s System Operator to the customer at the time of an Option ‘R’ curtailment

Du = duration of the curtailment (in hours)

FD = fixed discount amount, currently set at $0.04 [2] per kWh

If, for example, a customer contracts for 15,000 kW of Option ‘R’ load, but the Manitoba Hydro System Operator only requires 10,000 kW of curtailable load, the Reserve Discount will be calculated based only on the 10,000 kW regardless of whether or not the customer load drops by an amount greater than 10,000 kW. The Reference Discount however will be calculated in accordance with the formula provided in Section 3 (i).

5. USE OF CURTAILABLE LOAD

Reserves in the form of Curtailable Load can serve two general purposes. The first purpose is to minimize disruption to Firm Load in the event of a Contingency or Disturbance. Manitoba Hydro has a Contingency Reserve obligation to the MISO-MBHydro CRSG, or successor organization, to carry a pre-defined amount of Contingency Reserves, both Spinning and Supplemental, to respond to Contingencies and Disturbances in the MISO or Manitoba Hydro balancing areas.

The second purpose of Curtailable Load is to maintain a sufficient level of Planning Reserves and Operating Reserves to maintain reliable operation of the bulk electric system and compliance to NERC reliability standards.

2 The Fixed Discount amount is based on the value of carrying contingency reserves on Manitoba Hydro units.

Dependent on the Curtailment Option selected, Manitoba Hydro will curtail customers in response to system emergencies and to maintain Planning and Operating Reserves for the following reasons.

(i) Option ‘A’ and ‘C’ Curtailable Load

Manitoba Hydro will use curtailable load designated under Options ‘A’ and ‘C’, to meet reliability obligations only. These include:

- to re-establish the MISO-MBHydro CRSG’s or successor organization’s Contingency Reserves. Once Manitoba Hydro’s Contingency Reserves are deployed in response to a MISO-MBHydro CRSG’s Contingency or Disturbance, Manitoba Hydro is required to re-establish Contingency Reserves within 105 minutes of the event that triggered the commitment to supply the Contingency Reserve. A curtailment may be called to reestablish those reserves;

- to protect Manitoba Firm Load or firm exports, when Operating Reserves are insufficient to avoid curtailing Firm Load. This curtailment would be called prior to Manitoba Hydro curtailing Firm Load or firm exports; and

- as Planning Reserves to meet Manitoba Hydro or its firm export customers’ resource adequacy requirements.

(ii) Option ‘R’ Curtailable Load

The MISO-MBHydro (or successor organization) requires participants to maintain Contingency Reserves comprised of Spinning Reserves and Supplemental Reserves. Manitoba Hydro will use curtailable load designated under Option ‘R’ to deploy Manitoba Hydro’s Supplemental Reserves to the extent necessary, having first dispatched its own generation resources.

(iii) Option ‘E’ Curtailable Load

Curtailments under Option ‘E’ will be initiated to meet firm energy requirements in the event that Manitoba Hydro expects to be short of firm energy supplies.

Option 'E' customers will be curtailed prior to Manitoba Firm Load and firm export sales.

6. MAXIMUM LEVEL OF CURTAILABLE LOAD

Manitoba Hydro, at its discretion, can limit the amount of curtailable load needed to maintain Planning and Operating Reserve levels. Load under Option 'C' will no longer be available as of one year from the date of approval of the Terms and Conditions by the Public Utilities Board (the "sunset" date). Load currently served under Option 'C' will either revert to Firm Load or, at the customer(s) discretion, revert to Option 'A' Load prior to the sunset date.

(i) Option 'A' Curtailable Load

The maximum amount of curtailable load needed under Option 'A' has been set at 180 MW assuming Option 'C' load converts to Option 'A'. If however, Option 'C' load converts to Firm Load, the cap for Option 'A' will be set at 150 MW. Manitoba Hydro may, from time-to-time, submit an Application to the Public Utilities Board for changes to this amount.

(ii) Option 'R' Curtailable Load

The maximum amount of curtailable load needed under Option 'R' has been set at 50 MW, with a maximum number of participating customers at any time limited to three. Manitoba Hydro may, from time-to-time, submit an Application to the Public Utilities Board for changes to this amount.

(iii) Option 'E' Curtailable Load

There is currently no limit proposed.

7. CONTRACTS AND TERMINATION NOTICE

(i) Discounts or credits offered by the program, as well as all other terms and conditions, are fixed from the date of approval by the Public Utilities Board unless superseded by a further order of the Public Utilities Board or unless the program is withdrawn by Manitoba Hydro.

(ii) Customers selecting the Curtailable Rate Program will be required to contract for the service. In the event that the Public Utilities Board mandates changes to the program, which in Manitoba Hydro's opinion are material, Manitoba Hydro and the customer will agree to amend the contract to incorporate the changes, failing which the contract shall terminate immediately.

(iii) Customers accepting Curtailable service for the first time may switch curtailment options (subject to capacity limitations) or switch to Firm service entirely within the first six months, unless they have entered into the Curtailable Rate Program from another interruptible rate program.

(iv) Customers who have participated in the program for a period in excess of six months may:

a) re-contract for another Curtailable Rate Option for the following changes by providing two months' written notice to Manitoba Hydro.

- switch from Option 'C' to Option 'A' prior to the sunset date ;
- add Option 'E' to any other Option

b) switch from Option 'R' to Option 'A' or from Option 'A' to Option 'R' by providing one year's written notice to Manitoba Hydro. Switching can only occur if provision allows (i.e. the maximum level of load in a particular Option will not be exceeded as per Section 6).

c) switch from Curtailable to Firm service by providing one year's written notice to Manitoba Hydro in which case Manitoba Hydro may convert the load from Curtailable to Firm service at any time during the one year notice period. The one-year notice will not apply when the customer's decision to withdraw from the program is a result of material changes mandated by the Public Utilities Board as outlined in Section 7 (ii). Customers who have switched from Curtailable to Firm service may not be permitted to switch back to Curtailable service for one year, provided Curtailable load is available as defined in Section 6.

(v) Customers may re-designate their Protected Firm Loads or Guaranteed Curtailable Load by providing 12 months' written notice to Manitoba Hydro. Decreases to Protected Firm Load and/or increases to Guaranteed Curtailable Load may be subject to capacity limitations and will be at the discretion of Manitoba Hydro. The time period may be shortened if customers are decreasing their Protected Firm Load as a result of notification by Manitoba Hydro that additional Option 'R' curtailable load is available, as described in section 6 (ii). Customers increasing their Protected Firm Load and/or decreasing their Guaranteed Curtailable Load must maintain a minimum curtailable load of 5 MW per month.

8. MANNER OF NOTICE TO CURTAIL

(i) Option 'A' ,' C' and 'R' Customers

For Option 'A' and 'R' customers, the Notice to Curtail of five minutes means that the customer must reduce the load by the contracted curtailable amount or to the contracted firm amount within five minutes of the initiation from Manitoba Hydro. For Option 'C', the Notice to Curtail of one hour means that the customer must reduce the load within one hour from the time the "Notice to Curtail" is given.

Initiation will be by telephone or by an electronic signal sent to the customer by the Manitoba Hydro System Operator. Both the initiation signal and the load response will be recorded by Manitoba Hydro.

(ii) Option 'E' Customers

Manitoba Hydro will give Option 'E' customers notice in writing that their load may be curtailed when Manitoba Hydro expects to be short of firm energy supplies. Manitoba Hydro will provide not less than 30 days notice. Notice will be deemed received three days from the date of mailing; or if faxed or sent by electronic mail, on the date that it was sent.

After the notice period has been met, Option 'E' customers will be on standby and curtailable on 48 hours notice by fax or electronic mail. Manitoba Hydro will give Option 'E' customers notice in writing whenever their standby status is withdrawn.

9. DEMAND PRO-RATION FOR OPTION 'E" CUSTOMERS

Customers curtailed under Option 'E' will have their Demand Charge prorated on the curtailable portion of load to exclude the period during which an Option 'E' curtailment was in effect. For example, if the load were curtailed for ten days in December, the Demand Charge would be reduced by 10/31 or 32% and, as well, the curtailable credit would be applied. This additional discount would apply only during months of curtailment and only to that portion of load which is curtailable. This provision will not reduce the maximum demand established for the purposes of computing the demand ratchet.

10. ADDITIONAL CHARGES FOR FAILURE TO CURTAIL

(i) Option 'A' ,'C' and 'R' Customers

The first failure to curtail load on request in any contract period will not attract additional charges, but the customer will forego the discount for that month.

After the first failure, the following additional charges will apply. First subsequent failure in any 12-month period: loss of monthly discount plus additional charge equal to discount. Second and subsequent failure in any 12-month period: loss of discount and additional charge equal to 3x discount, at which time, Manitoba Hydro will have the right to exclude the customer from further participation in the program.

(ii) Option 'E' Customers

If the customer has elected to participate in Option 'E', in the event of a single failure to curtail load, Manitoba Hydro may in its own discretion exercise one of the following remedies:

a) the normal additional charges, as described in 10 (i); or

b) twenty-four hours after the time curtailment was to have started, Manitoba Hydro may cause electricity service to the Point of Delivery to be restricted to achieve the maximum load that should have been achieved by curtailment; or

c) if load limitation as described in 10 (ii) b) is, in Manitoba Hydro's opinion, not practical or reasonable, 24 hours after the time curtailment was to have started, Manitoba Hydro may cause electricity service to the Point of Delivery to be disconnected for the remainder of the period. Disconnection shall only take place after explicit written communication with the customer and only if, otherwise, Firm Load customers would be impacted.

11. DURATION OF CURTAILMENTS

Notwithstanding the maximum single curtailment duration provisions of each of the options, Manitoba Hydro will attempt to minimize the duration.

12. UNPLANNED INTERRUPTIONS

In addition to program curtailments for which notice is provided, customers will continue to be subject to unplanned interruptions such as those due to under frequency relay operation during power system emergencies. Manitoba Hydro cannot guarantee continuous service to any class of service in Manitoba or extra provincially.

CURTAILABLE RATE PROGRAM OPTIONS
AS OF APRIL 1, 2014
UNLESS SUPERCEDED BY FURTHER ORDER OF THE PUB

Discount to Demand Charge Expressed as Percentage of Reference Discount per kW/month.

OPTIONS	**TERMS AND CONDITIONS**					
	Minimum Notice to Curtail	Maximum Duration Per Curtailment	Maximum Daily Hours of Curtailment	Maximum Number Curtailments Per Year	Maximum Annual Hours of Curtailment	Discount as Percentage of Reference Discount
A	5 minutes	4-1/4 Hours	6 Hours (Oct 1 - Apr 30) 10 Hours (May 1 - Sep 30)	15 Curtailments	63.75 Hours	70%
C*	1 Hour	4 Hours	8 Hours	15 Curtailments	60.00 Hours	40%
E	48 Hours	10 Days	24 Hours	3 Curtailments	720.00 Hours	35%
R	5 minutes	4-1/4 Hours	10 Hours (Apr 1 – Mar 31)	25 Curtailments	106.25 Hours	70% + Reserve Discount
A & E	Combination	Combination	Combination	18 Curtailments	783.75 Hours	100%
C & E*	Combination	Combination	Combination	18 Curtailments	780.00 Hours	70%
R & E	Combination	Combination	Combination	28 Curtailments	826.25 Hours	100% + Reserve Discount

* Options ‘C’ and ‘CE’ will no longer be available as of the sunset date.

The Monthly Reference Discount shall equal A, and shall be adjusted on April 1st of each fiscal year by the annual inflation factor, where:

A = the amount of the Reference Discount which is related to the marginal value of capacity, expressed in Canadian Dollars. The Reference Discount of $3.36 per kW/month as of April 1, 2014 shall be adjusted each year by the Inflation Factor as defined below.

Inflation Factor = at the end of each fiscal year of Manitoba Hydro, the percentage change in the Consumer Price Index for Manitoba as recorded for the most recent set of 12 month periods for which data are available.

Reserve Discount: The fixed price to be paid for energy during curtailment under Option ‘R’ has been set at $0.04 per kW.h.

Manitoba Hydro

REPORT TO
THE PUBLIC UTILITIES BOARD

CURTAILABLE RATE PROGRAM

APRIL 1, 2013 – MARCH 31, 2014

September 2014

TABLE OF CONTENTS

Page No.

REPORT TO PUBLIC UTILITIES BOARD
CURTAILABLE RATE PROGRAM
APRIL 1, 2013 – MARCH 31, 2014

SUMMARY

This Curtailable Rate Program ("CRP") annual report covers the period from April 1, 2013 to March 31, 2014. During this period three customers participated in the program and 14 Option R curtailments were successfully initiated.

The Public Utilities Board ("PUB") Order 42/13 dated April 26, 2013 approved, on an interim basis, the CRP Reference Discount of $3.28/kW for fiscal 2013/14. Customers received monthly credits on their electrical bill for their participation in the program totaling $5,965,689 during this time.

Manitoba Hydro's 2012/13 & 2013/14 General Rate Application ("GRA") included proposed revisions to the Terms and Conditions of the Curtailable Rate Program. The main revisions included a reduction in the amount of Option A and Option R load available to customers, the elimination of curtailment Options C and CE; and a change to the hours defined as Peak and Off-Peak to correspond to a potential time-of-use rate offering.

In Order 43/13, the PUB accepted, on an interim basis, Manitoba Hydro's proposed changes to the Terms and Conditions of the CRP. As two of the changes proposed by Manitoba Hydro could not be easily reversed if final approval of the rate setting process was not granted given the proposed changes to the Terms and Conditions, Manitoba Hydro requested to defer implementation of the change in the defined hours for Peak and Off-Peak periods, and the elimination of Curtailment Options C and CE until such time as the PUB grants final approval. Manitoba Hydro also advised that it would implement the other changes to the CRP accepted by Order 43/13, including reducing the global subscription cap on Option A, but only to the extent that Option C load can still be accommodated. By letter dated June 25, 2013, the PUB accepted Manitoba Hydro's proposal.

BACKGROUND

The CRP Terms and Conditions applicable during the reporting period from April 1, 2013 to March 31, 2014 took effect on April 1, 2013.

The Terms and Conditions allow Manitoba Hydro to reserve the right to limit the amount of total curtailable load used for maintaining operating and contingency reserves[1]. Manitoba Hydro's application to revise the CRP Terms and Conditions included a reduction to available Option A and C load from 230 MW to 178 MW and available Option R load from 100 MW to 50 MW. There is no limit for Option E load. The revised caps do not affect current CRP customers. Upon final approval of the changes to the Terms and Conditions, the Option C customer will have one year to decide if they wish to convert their load to Option A or to firm service. The caps have been beneficial to both Manitoba Hydro and curtailable customers by ensuring the value of curtailable load does not depreciate. A decreased value would result in lower discounts paid to customers making the program less attractive to them.

Manitoba Hydro uses curtailable load, among other measures, to maintain operating and contingency reserves as a means of minimizing disruption to firm customers in the event of loss of generation or transmission.

Curtailable load provides value to Manitoba Hydro all year round, as curtailments for system emergencies can occur at any time of the year. However, it has the greatest value during peak times as it is during the peak periods that Manitoba Hydro's capacity surplus is the most vulnerable. Options A and C curtailable load in these hours increases the amount of capacity for sale in the export markets while Option R load can allow Manitoba Hydro to meet its contingency reserve obligations at a lower cost.

Curtailable load provides risk mitigation benefits to the power system. Curtailable load can be used to avoid shedding firm load and/or breach of North American Electric Reliability Council (NERC) standard(s) by Manitoba Hydro or the Midwest Independent System Operator-Manitoba Hydro Contingency Reserve Sharing Group (MISO-MBHydro CRSG)[2]. Option R curtailable load allows Manitoba Hydro to meet reserve obligations thereby freeing

---

[1] Per North American Electric Reliability Council (NERC) Glossary of Terms, Operating Reserves: The reserves needed to protect Manitoba Hydro and its obligations to the Midwest Independent System Operator power system against Contingencies or Disturbances. These events are typically a result of loss of supply caused by sudden generating or transmission outages. Operating Reserves consist of various types including Contingency Reserves. Contingency Reserves: a component of Operating Reserves which are sufficient in magnitude and response to meet NERC Disturbance Control Standards. Contingency Reserves are comprised of Operating Reserves-Spinning and Operating Reserves-Supplemental. Curtailable load (also referred to as Interruptible Load) can be a source of Operating Reserves-Supplemental.

[2] The MISO-MBHydro CRSG is a NERC registered Contingency Reserve Sharing Group that has operated since January 1, 2010. The CRSG was established under the terms of the Amended MISO-Manitoba Hydro Coordination Agreement and executed on October 9, 2009.

up hydro generation for market transactions in the short-term opportunity energy market[3]. In this circumstance the benefits of having Option R available are dependent on Manitoba Hydro's water supply conditions as follows:

- High Water Supply - the generating capacity freed up for commercial use allows for increased hydraulic generation for export as idle generating units can be run to capture additional sales. Without Option R capacity in place energy would be spilled. With Option R load, the additional energy generated can be sold at on-peak prices.

- Average Water Supply - allows for additional hydraulic generation during on-peak hours that would otherwise be produced during off-peak hours (due to limited on-peak generating capability). In this case Manitoba Hydro captures the benefit of the price differential between on and off-peak periods.

- Low Water Supply - does not provide any significant benefits because Manitoba Hydro has sufficient shut down generating units that could be run temporarily for operating reserves purposes without relying on Option R load reductions.

Manitoba Hydro will not initiate load curtailments in order to facilitate an opportunity spot market sale[4].

PERFORMANCE FOR 2013/14

Curtailment Options:

The Curtailable Rate Program consists of four base curtailment options and three combinations. Options vary dependent on: minimum notice to curtail, maximum duration per curtailment, maximum daily hours of curtailment, maximum number of curtailments per year, and maximum annual hours of curtailment.

[3] Opportunity export sales are sales of capacity and/or energy that are not backed by dependable energy and are incremental exports that arise from time to time as a result of water conditions that are better than the lowest historic levels.

[4] Spot market sales are sales that occur on a day ahead or real time basis. They are not considered to be a capacity sale.

The three customers that participated in the Curtailable Rate Program during the April 1, 2013 to March 31, 2014 period designated a total of 228 MW to Manitoba Hydro's reserves, allocated as 80 MW Option AE, 67 MW Option A, 31 MW Option C and 50 MW Option R. The amount each customer designated as curtailable load in relation to their total load varies, and therefore, impacts their curtailable credit, as shown on the following table:

Summary of Curtailment Credit Data April 1, 2013 to March 31, 2014					
Customer	**Option(s)**	**CRP Load as % of Total Load**	**Average On-Peak MW**	**Average On-Peak LF**	**Average Monthly Cr.**
1	A, R, E	87%	194.0	94.3%	$447,671
2	A	94%	24.5	93.6%	$49,469
3	C	0%	7.1	60.2%	$0

Customer 1: 87% of total load represents 41% Option AE, 26% Option R and 20% Option A for 2013/14.

Customer 3: this customer was operating below their protected firm load and therefore had no load available for curtailment.

Load designated under Option R must be nominated as a Guaranteed Curtailment. That is, the customer must agree to shed a specified number of MW in order to be compliant with the curtailment request. Under all the other curtailment options, customers can nominate curtailable load as Guaranteed Curtailment or Curtail to Protected Firm Load.

Dependent on the curtailment option selected, Manitoba Hydro will curtail customers to meet reliability obligations only. Options A, C and R curtailments assist in securing operating and contingency reserves whereas Option E curtailments are initiated to meet firm energy requirements in the event that Manitoba Hydro expects to be short of firm energy supplies.

Implementation and Size of Curtailments:

There were 14 Option R curtailments during the April 1, 2013 to March 31, 2014 period, all of which were initiated in response to a contingency or disturbance event requiring deployment of Manitoba Hydro's supplemental reserves. The following table summarizes the duration and load in MW of each curtailment.

April 2013 to March 2014	Option 'R'	
	Hrs	**MW**
April 18, 2013	0.63	50
April 19, 2013	0.25	50
April 25, 2013	0.77	50
May 27, 2013	1.77	50
June 6, 2013	0.70	50
June 21, 2013	1.37	50
July 3, 2013	0.93	50
July 3, 2013	1.55	50
July 7, 2013	1.43	50
July 17, 2013	0.73	50
August 19, 2013	1.72	50
September 3, 2013	0.23	50
February 5, 2014	3.05	50
March 27, 2014	0.75	50
Total	**15.88**	**N/A**
Average	**1.13**	**50**

All curtailments occurred during peak hours. The customer did not use an alternative power source to supply their load during the curtailments.

Manitoba Hydro continues to use telephone to communicate curtailment requirements to customers on the program. This procedure is manageable and provides the additional security that curtailment(s) will be initiated by confirmation from an agent of the customer. Manitoba Hydro experienced no difficulties in communicating the 14 curtailments during this reporting period.

Reference and Reserve Discounts:

The maximum discount available to a participating customer is called the “Reference Discount.” The Reference Discount is related to the marginal value of capacity, and is adjusted on April 1 of each year by the inflation factor. The Reference Discount in effect for the reporting period April 1, 2013 to March 31, 2014 was $3.28 per kW/month, as approved by the PUB, on an interim basis, in Order 42/13 dated April 26, 2013. Option AE customers receive 100% of the discount, while Option A and R customers receive 70% of the discount or $2.30 per kW/month. Option C customers receive 40% of the discount or $1.31 per kW/month.

For curtailable load nominated as 'Protect to Firm Load' the Reference Discount is calculated and credited to customers' bill each month as (A - B) x C x D where:

A = On-Peak Period Demand (kW)
B = Protected Firm Load (kW)
C = On-Peak Period Load Factor
D = Discount Amount

For curtailable load designated as a 'Guaranteed Curtailment' the Reference Discount is calculated and credited to customers' bill each month as GC x D where,

GC = the customer's guaranteed curtailable load
D = Discount Amount

Customers selecting Curtailment Option R receive, in addition to the Reference Discount, a Reserve Discount for each curtailment initiated and successfully completed. The Reserve Discount represents the value of carrying contingency reserves and is calculated and credited to customers' bill for each successful curtailment as LR x Du x FD where,

LR = amount of load reduction (in kW) requested by Manitoba Hydro's System Control to the customer at the time of an Option R curtailment
Du = duration of the curtailment (in hours)
FD[5] = fixed discount amount, currently set at $0.04 per kWh

The table below illustrates the amount of the monthly Reference Discount Credit that each customer received from April 1, 2013 to March 31, 2014, as well as their monthly On-Peak Demand and On-Peak Load Factor.

Monthly Reference Discount Credit									
2013 to 2014	Customer 1 Options AE, R, A			Customer 2 Option A			Customer 3 Option C		
	On Peak MW	LF %	Discount Paid $	On Peak MW	LF %	Discount Paid $	On Peak MW	LF %	Discount Paid $
Apr	208.8	92.6%	$439,020	24.6	97.6%	$51,875	31.7	59.4%	$0
May	207.8	83.9%	$408,342	24.9	93.7%	$50,388	28.6	39.5%	$0
June	175.5	93.8%	$443,042	24.6	92.5%	$49,159	19.0	6.1%	$0
Jul	175.5	97.7%	$456,860	24.6	94.7%	$50,350	0.7	70.1%	$0

[5] The Fixed Discount amount is based on the value of carrying contingency reserves on Manitoba Hydro units.

Monthly Reference Discount Credit									
2013 to 2014	Customer 1 Options AE, R, A			Customer 2 Option A			Customer 3 Option C		
	On Peak MW	LF %	Discount Paid $	On Peak MW	LF %	Discount Paid $	On Peak MW	LF %	Discount Paid $
Aug	175.5	97.4%	$455,635	24.8	98.1%	$52,438	0.7	69.9%	$0
Sep	175.5	95.7%	$449,584	24.7	67.8%	$36,131	0.7	74.4%	$0
Oct	175.5	95.7%	$449,654	24.3	95.8%	$50,310	0.8	56.5%	$0
Nov	209.3	93.9%	$443,462	24.1	99.5%	$51,754	0.8	68.1%	$0
Dec	205.9	92.8%	$439,684	24.4	97.7%	$51,475	0.9	76.7%	$0
Jan	207.0	97.6%	$456,335	24.3	95.6%	$50,168	0.9	46.0%	$0
Feb	205.9	96.4%	$452,137	24.1	96.1%	$50,011	0.4	78.2%	$0
Mar	205.9	94.8%	$446,540	24.3	94.4%	$49,575	0.4	78.1%	$0
Total	**2,328.0**	**94.3%**	**$5,340,296**	**293.8**	**93.6%**	**$593,633**	**85.5**	**60.2%**	**$0**

The discounts shown for Customer 1 do not include the $31,760 credited in respect of the Option R Reserve Discount.

Adequacy of Terms and Conditions:

Manitoba Hydro proposed revisions to the Terms and Conditions of the Curtailable Rate Program as part of its 2012/13 & 2013/14 GRA. The revisions included:

- a reduction in the amount of Option A and Option R load available to customers;
- elimination of curtailment Options C and CE;
- change in hours defined as Peak and Off-Peak to correspond to a potential time-of-use rate offering;
- removal of the monthly variation to nominate curtailable or firm load; and
- exclusion from the program after a customer's 2nd failure to curtail in a 12 month period.

In Order 43/13, dated April 26, 2013, the PUB accepted the proposed revisions as noted above, on an interim basis. Subsequent to the receipt of that Order, Manitoba Hydro, in its letter dated May 15, 2013, informed the PUB of the difficulty in implementing a change in the defined Peak and Off-Peak hours, and elimination of Option C and CE on an interim basis, and proposed that these changes be deferred until such matters can be finalized. The PUB, in its letter dated June 25, 2013, confirmed Manitoba Hydro's proposed approach.

The Terms and Conditions have protected Manitoba Hydro's contingency reserves and provided operating reserves that satisfy the requirements of NERC and the MISO-MB Hydro CRSG.

CONCLUSION

The Curtailable Rate Program facilitates fulfilling Manitoba Hydro's commitment of carrying, deploying, and re-establishing contingency reserves to meet its obligations with the MISO-MBHydro CRSG and to maintain compliance to NERC Standards. The program also assists in minimizing disruption to Manitoba Hydro's firm customers.

CRP continues to fulfill Manitoba Hydro's obligations, and with the above mentioned changes to the Terms and Conditions, will preserve the value of the program to both Manitoba Hydro and its customers.

ATTACHMENT 1

ESTIMATE OF THE VALUE OF CURTAILABLE LOAD TO MANITOBA HYDRO

The value of curtailable load to Manitoba Hydro is related to an estimate of the marginal cost of firm, long-term capacity. Over the long term, a representative value for capacity can be developed by estimating the annual carrying cost (includes finance and depreciation costs but not operating/fuel costs) of the lowest cost resource required to provide capacity to Manitoba Hydro, which is a simple cycle combustion turbine (SCCT). In 2005 the annual carrying cost of a SCCT was estimated to be $78 per kW per year, or $6.50 per kW per month, evaluated at load. It was proposed that this cost would escalate at the rate of inflation. This cost was reviewed in 2012 and was found to be appropriate going forward. This approach has the advantage of providing a clear transparent value, which is also stable over time and is consistent with the approach that is utilized to evaluate the benefits of other resource options such as DSM that may have a capacity component.

Curtailable load is less valuable than a generation resource such as a SCCT. The SCCT can provide more flexibility in dispatch and also has the capability to deliver for longer time periods during extended emergency situations. Once in place, a SCCT can be relied upon as a permanent, long-term resource, unlike curtailable load which can be terminated with a notice period of one year. Curtailable load normally has more value in the summer months, when it can assist in supporting seasonal capacity exports, and in the peak winter months, when it may add reliability to the Manitoba Hydro system. Curtailable load will provide more winter reliability benefits in years in which there is little capacity surplus on the system. When there is a significant capacity surplus on the Manitoba Hydro system, curtailable load provides less winter value than it would, for example, in the period around the 2023/24 time period, when the requirement to add generation to serve domestic customers may be expected to occur with 2013 planning assumptions and base demand side management program assumptions. The value of reliability benefits in a single year is not easily determined, which is why longer-term levelized values are used to infer the benefits of curtailable load.

The economic benefits of curtailable load can vary considerably year to year for a number of reasons. In the case of Option R CRP, the economic benefits derived from this option will vary depending on water conditions. Export market conditions can also impact the value of curtailable load to Manitoba Hydro. In the MISO market, current supply and demand conditions for capacity resources can cause variability in the near term value of capacity resources. Use of a longer-term levelized value maintains stability in CRP pricing, therefore sheltering the CRP customer from these sources of variability.

As described above curtailable load is less valuable than a SCCT because it has limited dispatchability, is not sustainable in reducing load over longer periods, and is not guaranteed to exist in the long term. Therefore in order to reflect these factors, curtailable load is assigned a long-term levelized value that is 42% of the annual carrying cost of a SCCT. After consideration of inflation subsequent to the 2011 base year, this yields an estimate of benefits for the year beginning April 1, 2013 of $3.28 per kW/month, which is referred to as the "Reference Discount". This value would apply to the curtailable rate option that provides the most value to Manitoba Hydro, that being Options AE and RE, for which the discount is set to return 100% of the estimated value of curtailable load to the customer. Other options provide less flexibility and are accordingly worth less to Manitoba Hydro. These have been priced to reflect their lesser value to Manitoba Hydro but still to return the full estimated value of that option to the customer.

REPORT TO

THE PUBLIC UTILITIES BOARD

LIMITED USE OF BILLING DEMAND

2013/14

September 2014

Manitoba Hydro

TABLE OF CONTENTS

REPORT TO PUBLIC UTILITIES BOARD ON THE LIMITED USE OF BILLING DEMAND RATE OPTION

SUMMARY

This report on the Limited Use of Billing Demand ("LUBD") rate option covers the period April 1, 2013 to March 31, 2014. During this period there were 81 customers on the LUBD rate, of which 59 are classed as General Service Small, 16 are General Service Medium, and 6 are General Service Large.

The LUBD rate option, implemented on July 1, 2000, is a rate option that Manitoba Hydro offers to address the concerns of low load factor customers. These customers, if billed on standard General Service Demand rates, are affected by high demand charges in comparison to relatively low energy use, resulting in a high cost of energy per kilowatt-hour. Customers on LUBD have a lower impact on the system peak compared to the overall General Service class, as is evident by their low winter coincidence factor of 31%.

Billing on LUBD rates as opposed to standard General Service Demand rates has saved LUBD customers approximately $290,000 during the 2013/14 fiscal year. This represents annual savings of approximately $3,600 per LUBD customer or $300 per customer per month.

BACKGROUND

In Order 91/00, dated June 30, 2000, the Public Utilities Board of Manitoba ("PUB") approved Manitoba Hydro's LUBD program, on an interim basis, as a temporary rate offering for a two-year period commencing July 1, 2000. The program became a permanent rate offering in Order 116/08 dated July 29, 2008, when the PUB granted final approval of the terms and conditions of the LUBD and directed Manitoba Hydro to file status reports on the LUBD rate option on an annual basis.

The LUBD rate was introduced to address the high unit energy costs faced by a relatively small number of customers with very low load factors. These customers, who set high demands relative to their overall energy use, were opposed to paying high demand charges when they used little energy. Under the program, customers could opt for a lower demand charge in exchange for a higher energy charge. Demand charges are intended to recover at least a portion of the utility's costs incurred to meet the peak load that do not vary with a customer's consumption. The LUBD rate option recognizes that low load factor customers, as a group, have a much lower ratio of coincidence with system peak periods than typical General Service customers, and therefore, the cost associated with meeting the peak of low-load factor customers is lower.

DESCRIPTION

The LUBD rate was designed such that demand customers would be indifferent between this rate and the standard General Service rate for which they otherwise qualify at a billing load factor of approximately 18%. At billing load factors less than 18%, customers could reduce their overall bills by paying a higher energy charge in exchange for a lower demand charge.

There is no change in the Basic Charge or determination of the Billing Demand when customers choose LUBD over standard rates.

ELIGIBILITY

All General Service Demand customers are eligible for the LUBD rate but only those customers with low energy use relative to their billing demand will benefit from selecting this option. Customer savings depend on the manner in which the business operates and consumes energy. This means that two customers with the same average annual billing load factor may not see the same results, and a lower annual billing load factor does not necessarily mean more savings. For example, a GS Small Demand customer who exceeds 50 kV.A in only a few months of the year may save little in Demand Charges if they are on LUBD (and pay for all energy at the higher LUBD Energy rate) compared to a customer with an identical billing load factor that exceeds 50 kV.A by a significant margin in most or all months of the year.

LUBD customers who elect to convert back to the standard General Service Rate are not eligible to participate in the LUBD rate option for the next 12 months.

CUSTOMER PARTICIPATION

There were a total of 81 customers that billed on the LUBD rate in the 2013/14 fiscal year, an overall decrease of 2 customers from the 2012/13 fiscal year.

The majority of customers on LUBD continue to be in the General Service Small Demand rate class as shown in Table 1 which provides a summary of the number of customers, by rate class, participating in the LUBD rate option in 2013/14:

Table 1

Rate Class	No. of Customers
General Service Small	59
General Service Medium	16
General Service Large (750 V to 30 kV)	3
General Service Large (> 100 kV)	3
Total	**81**

In the 2013/14 fiscal year, the majority (approximately 85%) of LUBD customers had an annual billing load factor of 20% or less, as shown in Table 2. Customers with a load factor over 20%, or customers not benefiting on LUBD, are referred to their Manitoba Hydro Representative for review.

Table 2:

Billing Load Factor	No. of LUBD Customers
0% - 5%	19
6% - 10%	15
11% - 15%	24
16% - 20%	11
over 20%	12
Total	**81**

The billing load factors for LUBD customers are considerably lower than billing load factors associated with typical General Service customers. Based on 2013/14 billing data, the billing load factor for regular General Service customers was 45% for GS Small Demand, 53% for GS Medium, 59% for GS Large 750 V to 30 kV, and 80% for GS Large > 100 kV.

Load Research data for 2012/13 indicates that the peak coincidence factor for the LUBD class is also lower than the class average peak coincidence factor, as shown in Table 3 below:

Table 3:

Rate Class	Summer Coincidence Factor %	Winter Coincidence Factor %
LUBD	42%	31%
GSS Demand	89%	91%
GSM	91%	92%
GSL 750 V - 30 kV	89%	90%
GSL > 100 kV	57%	77%

Customers participating in LUBD represent 29 different industry types as defined by Statistics Canada and listed in Table 4. The majority of customers fall in the category of "Other Utility Industries" which typically represents water and waste pumping stations. Other major industry types include Amusement/Recreational Services, Agriculture, and Wood industries. These four industries represent 41% of the LUBD customers.

Table 4:

Industry Type	# of Customers
Accommodation	1
Agriculture	8
Amusement and Recreational Services	8
Auto. Vehicles, Parts, Sales & Service	1
Business Services	1
Chemical and Chemical Products	1
Education	3
Electrical and Electronic Products	1
Fabricated Metal Products	4
Furniture and Fixtures	1
Industrial and Heavy Construction	2
Local Government	1
Membership Organizations	2
Metals, Hardware, Plumb, Heat, Wholesale	2
Miscellaneous Government	2
Non-Metallic Mineral Products	1
Other Products, Wholesale	5
Other Service Industries	3
Other Utility Industries	10
Paper and Allied	1
Plastic Products	3

Industry Type	**# of Customers**
Primary Metals	1
Printing, Publishing & Allied	1
Real Estate Operators	2
Refined Petroleum and Coal Products	1
Storage and Warehousing	5
Transportation	1
Transportation Equipment	2
Wood	7
Total	81

FINANCIAL IMPACTS

For 2013/14, the total savings to customers on the LUBD rate option, compared to the standard General Service rate, was approximately $290,000 ($3,600 per customer or $300 per customer month). Of the 81 customers, 58 benefited during the 12 month period while 23 customers paid more in comparison to the standard General Service rate. These 23 accounts have been referred to their Manitoba Hydro Representative for review. The majority will likely stay on LUBD as the loss for the year was minimal and there is potential for savings in the future given the nature of their usage. Four customers however have switched off LUBD and are now billing under the standard General Service rate, while another service has since been removed.

Table 5 provides a comparison of the revenue billed to LUBD customers versus what they would have been billed had they remained on the standard General Service rate based on the 2013/14 fiscal year. Table 6 provides a distribution of the number and percentage of LUBD customers by average monthly savings (loss) realized through their participation in the LUBD rate offering in 2013/14.

Table 5:

Rate Class	**As Billed on LUBD**	**If Billed as Standard GS**	**Annual Difference**
General Service Small	$ 372,873	$ 447,704	$74,832
General Service Medium	$ 442,035	$ 546,103	$104,068
General Service Large (750 V to 30 kV)	$ 71,283	$ 91,696	$20,412
General Service Large (> 100 kV)	$ 131,304	$ 222,108	$90,804
Total	**$1,017,495**	**$1,307,612**	**$290,116**

Table 6:

Average Monthly Savings (Loss)	No. of LUBD Customers	% of LUBD Customers
Over $1,501	2	2%
$1,001 - $1,500	4	5%
$501 - $1,000	10	12%
$201 - $500	15	19%
$101 - $200	7	9%
$0 - $100	21	26%
$(1) - $(50)	15	19%
$(51) - $(100)	5	6%
Over $(100)	2	2%
Total	**81**	**100%**

CONCLUSION

The LUBD rate was designed to provide an electricity rate option for customers with low billing load factors and it is generally performing as anticipated. The revenue impact to Manitoba Hydro of billing customers under the LUBD instead of the respective General Service Demand rates is modest at approximately $290,000 for the last fiscal year.

June 23, 2014

Mr. H. Singh
Executive Director
Public Utilities Board
400-330 Portage Avenue
Winnipeg, Manitoba
R3C 0C4

Dear Mr. Singh:

RE: Manitoba Hydro Roadway Lighting Conversion Program- Application for Interim Light Emitting Diode Rates for the Area and Roadway Lighting Class

Manitoba Hydro's efforts toward pursuing Demand Side Management ("DSM") opportunities were reviewed extensively by the Public Utilities Board ("PUB") and other parties at the recently concluded Needs for and Alternatives To ("NFAT") proceeding. The importance of Manitoba Hydro's investment in DSM to meet Manitoba's future electricity demand in the most economic manner and to assist customers with managing their energy bills was acknowledged by all parties. Manitoba Hydro remains committed to continuing its aggressive pursuit of all economic DSM opportunities to meet these goals.

During the NFAT proceeding, Manitoba Hydro introduced its 2014 to 2017 Power Smart Plan ("the Plan"), which includes aggressive new energy efficiency targets that will see investments in the utility's Power Smart programs more than double over the next three years. One of the commercial initiatives included in the Plan is the Light Emitting Diode ("LED") Roadway Lighting Conversion Program (the "LED Conversion Program"), which Manitoba Hydro will launch in the summer of 2014.

The Corporation is requesting the approval of new LED rates that will allow Manitoba Hydro to effectively introduce this program, and contribute toward the successful attainment of the Power Smart targets outlined in the Plan.

Information with respect to the LED Conversion Program and the achievement of Power Smart energy conservation targets related to the improved efficiency of LED streetlights compared with the current HPS streetlight technology is provided herein for the PUB's consideration in approving new rates for this program.

Manitoba Hydro's LED Roadway Lighting Conversion Program

Manitoba Hydro has been pursuing energy efficient opportunities in the area of lighting for over 20 years, through its Commercial Lighting Program and its past Roadway Lighting Conversion and Residential Compact Fluorescent Lighting programs. As a continuation of these efforts, the LED Conversion Program will retrofit existing High Pressure Sodium ("HPS") roadway lights to LED fixtures over a seven year period. The LED roadway lighting fixtures will consume approximately 40 percent less electricity compared to HPS lighting, and as such, the LED Conversion Program will assist Manitoba Hydro in achieving its Power Smart energy conservation targets.

LED technology produces a more direct white light and has a 20 year product life, while HPS technology produce a yellow/orange light and has only a 5 year product life. In 2013, Manitoba Hydro began conducting pilot replacements with 44 HPS roadway lights being converted to LED on nine streets in Winnipeg and Thompson, which resulted in total annual energy savings of over 9,000 kWh. These pilot projects enabled Manitoba Hydro to monitor the product performance of different LED manufacturers, the light outputs, and general customer feedback. To date, Manitoba Hydro has not experienced any performance issues or issues with public acceptance of the lighting.

In addition to the energy cost savings and efficiencies LEDs will derive for Manitoba Hydro, LED fixtures will also improve the efficiency mandates of a number of municipalities in the Province. To that end, the Association of Manitoba Municipalities ("AMM") recently passed a resolution to lobby Manitoba Hydro for the provision of LED lighting options when replacing and/or installing lighting fixtures. The AMM resolution with respect to LED Street Lighting is provided as Attachment 1 to this Application.

Manitoba Hydro will launch its LED Conversion Program in the summer of 2014, and in working with Manitoba municipalities and local governments, will convert all HPS roadway lighting (less than 1000W) to energy efficient LED technologies over the next 7 years. The program is expected to achieve 35 GWh in electricity savings and 5 MW in winter peak demand savings by 2020/21, and is expected to reduce Manitoba Hydro's street-light maintenance costs of single light out calls by approximately $800,000 annually once the entire conversion program has been fully implemented.

Proposed LED Rates

Manitoba Hydro is requesting PUB approval, on an interim basis, to implement LED rates for the Area and Roadway Lighting Class. Manitoba Hydro does not currently have rates in place for LED roadway lighting fixtures. The new LED rates are required at this time in order to accurately and appropriately charge customers for services provided under Manitoba Hydro's Area and Roadway Lighting rate schedule, given the initiation of the replacement of HPS lighting with LED lighting fixtures beginning in the summer of 2014.

Attachment 2 provides the supporting calculations for the proposed LED rates. Manitoba Hydro derived the proposed LED rates by determining the annual kilowatt hour savings expected to be achieved by converting from HPS lighting to LED and then determining the monthly cost savings using the Area and Roadway Lighting Energy charge from Manitoba Hydro's 2013 Prospective Cost of Service Study (PCOSS 13) updated to reflect actual rate increases for September 1, 2012, May 1, 2013, and May 1, 2014. The monthly cost savings were then deducted from the approved HPS rates effective May 1, 2014, to determine the proposed LED rates.

Attachment 3 provides the proposed rate schedules (pages 18 and 19) for rates effective August 1, 2014, which include proposed LED rates for the Area and Roadway Lighting class. The proposed rates will apply to all LED installations, including new installations and those related to the replacement of existing HPS fixtures.

Manitoba Hydro has also provided a copy of this Application to Area and Roadway Lighting customers that will benefit from the new LED rates, namely the City of Winnipeg and the Association of Manitoba Municipalities.

Should you have any questions with respect to the foregoing, please do not hesitate to contact the writer at 204-360-3257.

Yours truly,

MANITOBA HYDRO LAW DIVISION

Resolutions

AMM Resolution #26-2013

Manitoba Hydro LED Street Lighting

Sponsor(s)	Department(s)
Tache, RM (Eastern)	Manitoba Hydro

THEREFORE BE IT RESOLVED THAT the Association of Manitoba Municipalities lobby Manitoba Hydro to provide LED lighting options to municipalities when replacing and/or installing lighting fixtures.

Manitoba Hydro | **Attachment 2**
Application for Interim LED Rates | **June 23, 2014**

NEW RATE NAME		HPS Category	HPS Wattage	LED Wattage	Wattage Savings	kW Savings	Annual Hours	Annual kWh Savings	Energy Rate	Annual Energy Savings	Per Month Savings	Approved Monthly HPS Rate	Proposed Monthly LED Rate

ELECTRIC LOAD FORECAST

INDEX

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

ELECTRIC LOAD FORECAST

7.0 OVERVIEW

Tab 7 provides a summary of the 2014 Electric Load Forecast.

The province of Manitoba is growing, both in population and economically, resulting in more housing and in increases in related services within the commercial sector. Economic growth results in the anticipated expansion associated with commercial and industrial customers. Together, forecast population and economic growth result in a Manitoba load that is expected to grow in all sectors.

This Tab provides information on both current load and load growth assumptions. Manitoba Hydro considers all available options for meeting the energy needs of Manitobans, including both demand-side resources and supply-side resources as discussed in Tab 9. The current Demand Side Management plan, as detailed in Tab 8, is combined with the load forecast to represent the forecast net load, which is used to forecast general consumers revenue in MH14.

7.1 ELECTRIC LOAD FORECAST SUMMARY

The Electric Load Forecast provides a long term projection of future electricity demand in Manitoba with a forecast provided for both energy and capacity requirements. The load forecast is reviewed and updated on an annual basis as part of the annual corporate planning cycle. A copy of the 2014 Electric Load Forecast is provided in Appendix 7.1.

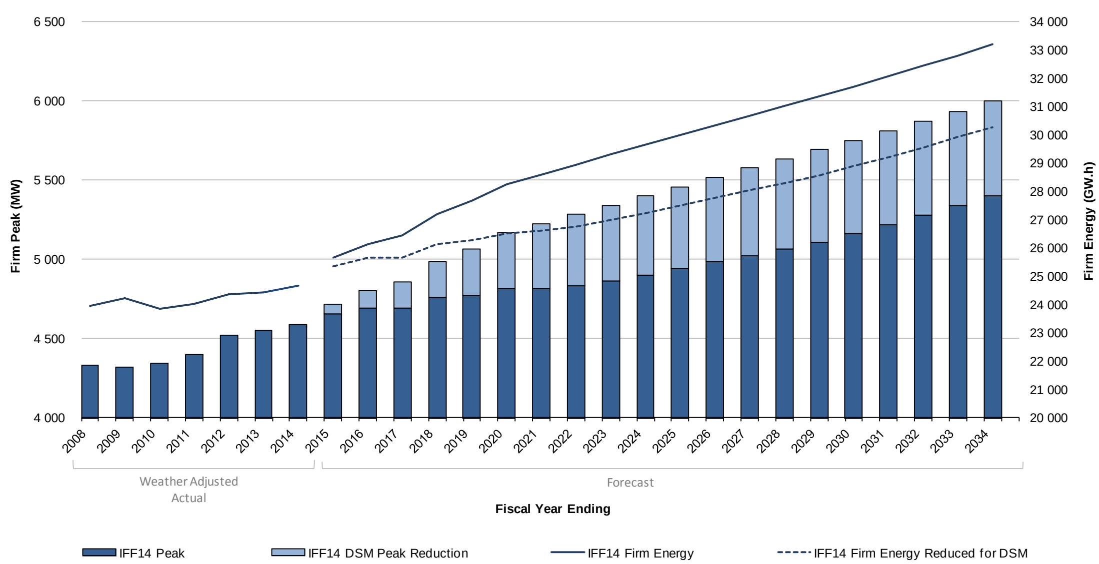
Manitoba load is forecast for the following sectors: Residential, General Service – Mass Market, General Service – Top Consumers, Losses and Station Service, and Miscellaneous. The Residential and General Service markets combined represent the majority of energy use in Manitoba.

The 2014 Load Forecast reflects the following with respect to Demand Side Management (“DSM”):

- Historical load values include the effect of Manitoba Hydro's past DSM efforts, including both improvements to energy codes and standards, as well as past market-based Power Smart programs.
- Forecast load values reflect the future impact of implemented or committed energy codes and standards, but not future activity under market–based DSM programs.
- Forecast future activity under market-based DSM programs has not been removed from the 2014 Load Forecast. The energy savings forecast to be achieved through future market-based DSM programs are considered in the Peak and Energy demand information provided in Tab 9 of the Application.

The figure below provides the forecast growth in Manitoba Hydro's load, as well as the reduction to forecast load growth including the impacts of the forecast DSM activities. Manitoba Hydro's DSM initiatives are described in detail in Tab 8 of the Application.

Figure 7.1



The figures in section 7.1 below compare the 2014 Electric Load Forecast to the forecast adjusted for the DSM Savings attributable to the future market-based DSM Programs.

Manitoba Hydro continually seeks to enhance the forecast and its supporting methodologies. The load forecast is produced annually to take into account changes in the markets as well as new outlooks into the future. This allows the planning process at

Manitoba Hydro to make annual adjustments to account for incremental changes and adjust for longer-term trends. A comparison describing the changes between the 2013 Electric Load Forecast and the 2014 Electric Load Forecast can be found in the 2014 Electric Load Forecast (Appendix 7.1) starting at page 12. The description of the methodology can be found in the 2014 Electric Load Forecast starting on page 59.

7.1 Residential Sector

Historical Period (1994/95 - 2013/14):

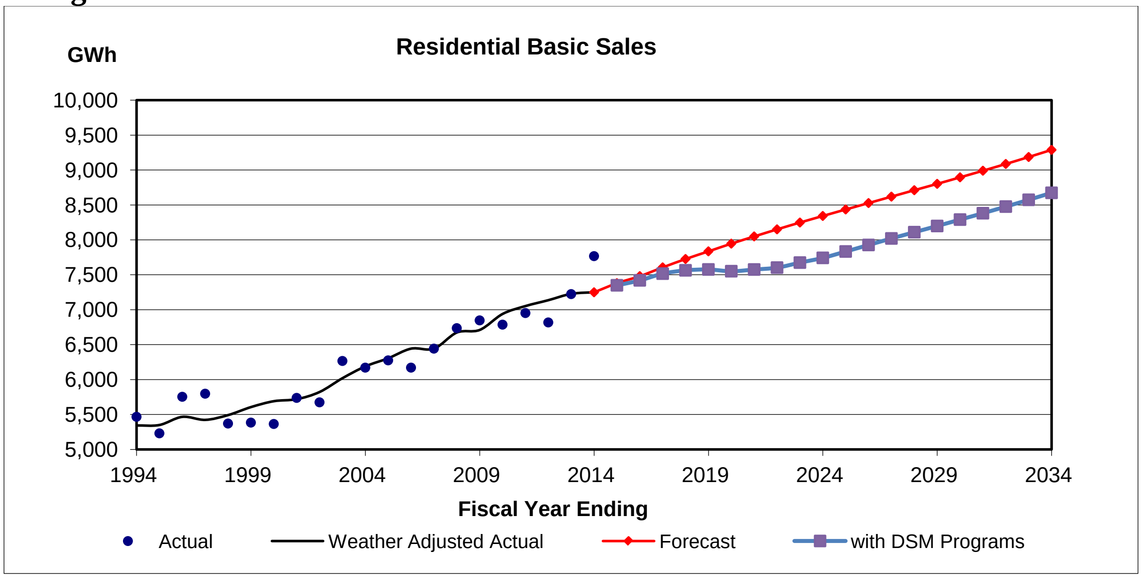
The residential sector had minimal growth during the 1990's but growth has been steady since about 1999. During the last 20 years, weather adjusted Residential consumption has been growing at an average of 100 GWh or 1.6% per year. This growth reflects the effects of past improvements in energy efficiency codes and standards and past participation in Power Smart programs.

Forecast Period (2014/15 – 2033/34):

Over the forecast period, the Residential sector is expected to grow by 102 GWh or 1.2% per year. This is primarily due to anticipated growth in population which accounts for 1% of the growth. The increase in average use per customer is expected to add 0.2% to the annual growth. With the inclusion of energy savings to be achieved through Power Smart programs, the overall net Residential growth is expected to be 71 GWh or 0.9% per year.

Figure 7.2 below provides a graphical representation of the historical and forecast usage of the Residential sector.

Figure 7.2- Residential Sales



Note: Sales forecast at meter.

7.2 General Service Sector

Historical Period (1994/95 - 2013/14):

During the past 20 years, the General Service sector overall has grown 203 GWh or 1.7% per year on a weather-adjusted basis. This growth reflects the effects of past improvements in energy efficiency codes and standards and past participation in Power Smart programs.

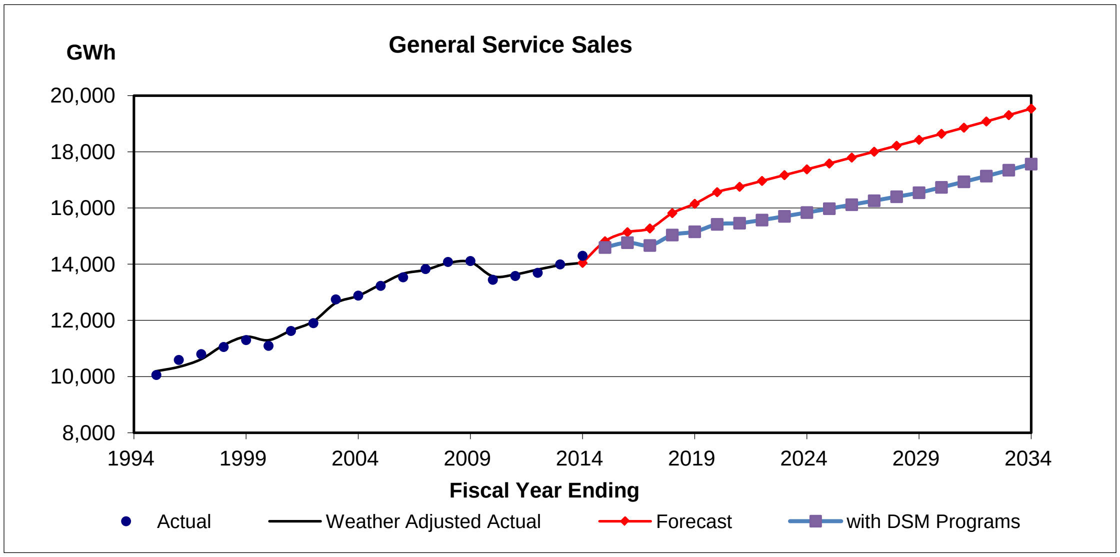
The General Service sector primarily consists of two categories of consumers: Mass Market and Top Consumers. Mass Market has grown steadily at an average of 117 GWh per year or 1.6%. The Top Consumers are more sensitive to economic conditions and were growing at an average of 173 GWh per year until the onset of the economic downturn of 2009/10. During 2009/10 and 2010/11, the Top Customers decreased 741 GWh and excluding the loss of one Top Consumer, have since recovered and resumed normal operations.

Forecast Period (2014/15 – 2033/34):

Growth in the General Service sector is forecast to grow 274 GWh or 1.7% per year over the forecast period. Mass Market is expected to contribute 142 GWh per year of projected growth with Top Consumers contributing the remaining 132 GWh per year. This includes the anticipated short term committed load growth in the Pipeline sector, minor growth in other Top Consumers and an expected Top Consumer load decrease. The inclusion of Power Smart programs lowers General Service growth to 176 GWh or 1.1% per year.

Figure 7.3 below provides a graphical representation of the historical and forecast usage of the General Service sector.

Figure 7.3- General Service Sales



Note: Sales forecast at meter.

7.3 Gross Firm Energy

Gross Firm Energy includes all electricity that is generated to meet firm energy requirements for all customers within Manitoba and excludes non-firm (interruptible load).

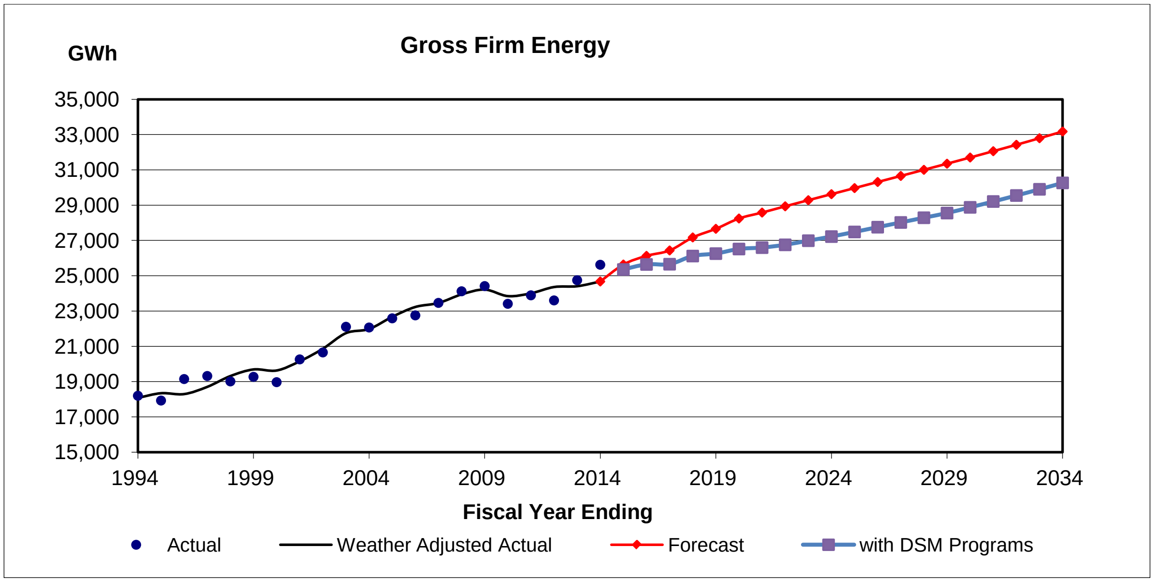
Historical Period (1994/95 - 2013/14):

During the past 20 years, Gross Firm Energy has grown 333 GWh or 1.6% per year on a weather-adjusted basis. The trend in Gross Firm Energy growth has been relatively consistent over the period and reflects the effects of past improvements in energy efficiency codes and standards and past participation in Power Smart programs. As noted earlier, the economic downturn had a significant impact on some General Service Top Consumers in 2009/10 and was the main reason for the decline that year; however, since then excluding the loss of one Top Consumer, this sector has since recovered and resumed normal operations.

<u>Forecast Period (2014/15 – 2033/34)</u>:
During the forecast period, Gross Firm Energy is expected to grow 425 GWh or 1.5% per year. The inclusion of Power Smart programs will lower Gross Firm Energy growth to 279 GWh or 1.0% per year.

Figure 7.3 below provides a graphical representation of the historical and forecast usage of Gross Firm Energy.

Figure 7.4- Gross Firm Energy



Note: Energy forecast at generation.

7.4 Gross Total Peak

The Gross Total Peak is the maximum hourly load required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports and diesel customers with curtailed loads added back in. The term "integrated" indicates that the average load within the peak hour is used.

<u>Historical Period (1994/95 - 2013/14)</u>:

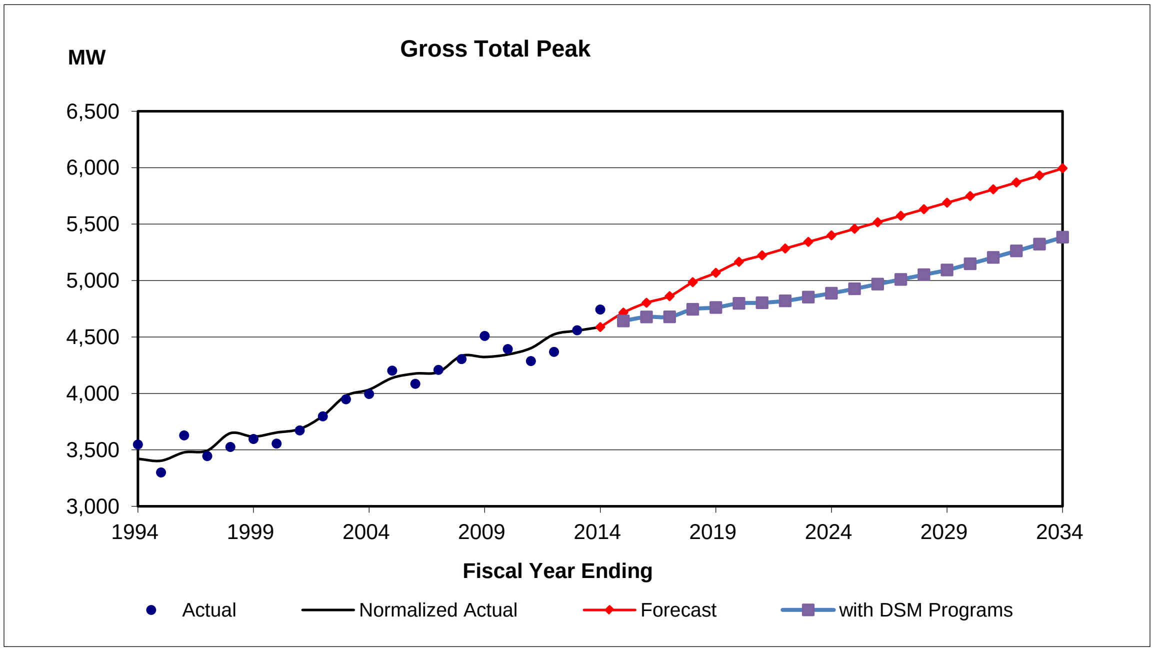
During the past 20 years, Gross Total Peak has grown 62 MW or 1.6% per year on an adjusted basis. Gross Total Peak has grown significantly since 2000/01, reflecting the general growth in energy load over that period.

<u>Forecast Period (2014/15 – 2033/34)</u>:

During the forecast period, Gross Total Peak is projected to grow 70 MW or 1.3% per year. The inclusion of Power Smart programs will lower the demand growth to 40 MW or 0.8% per year.

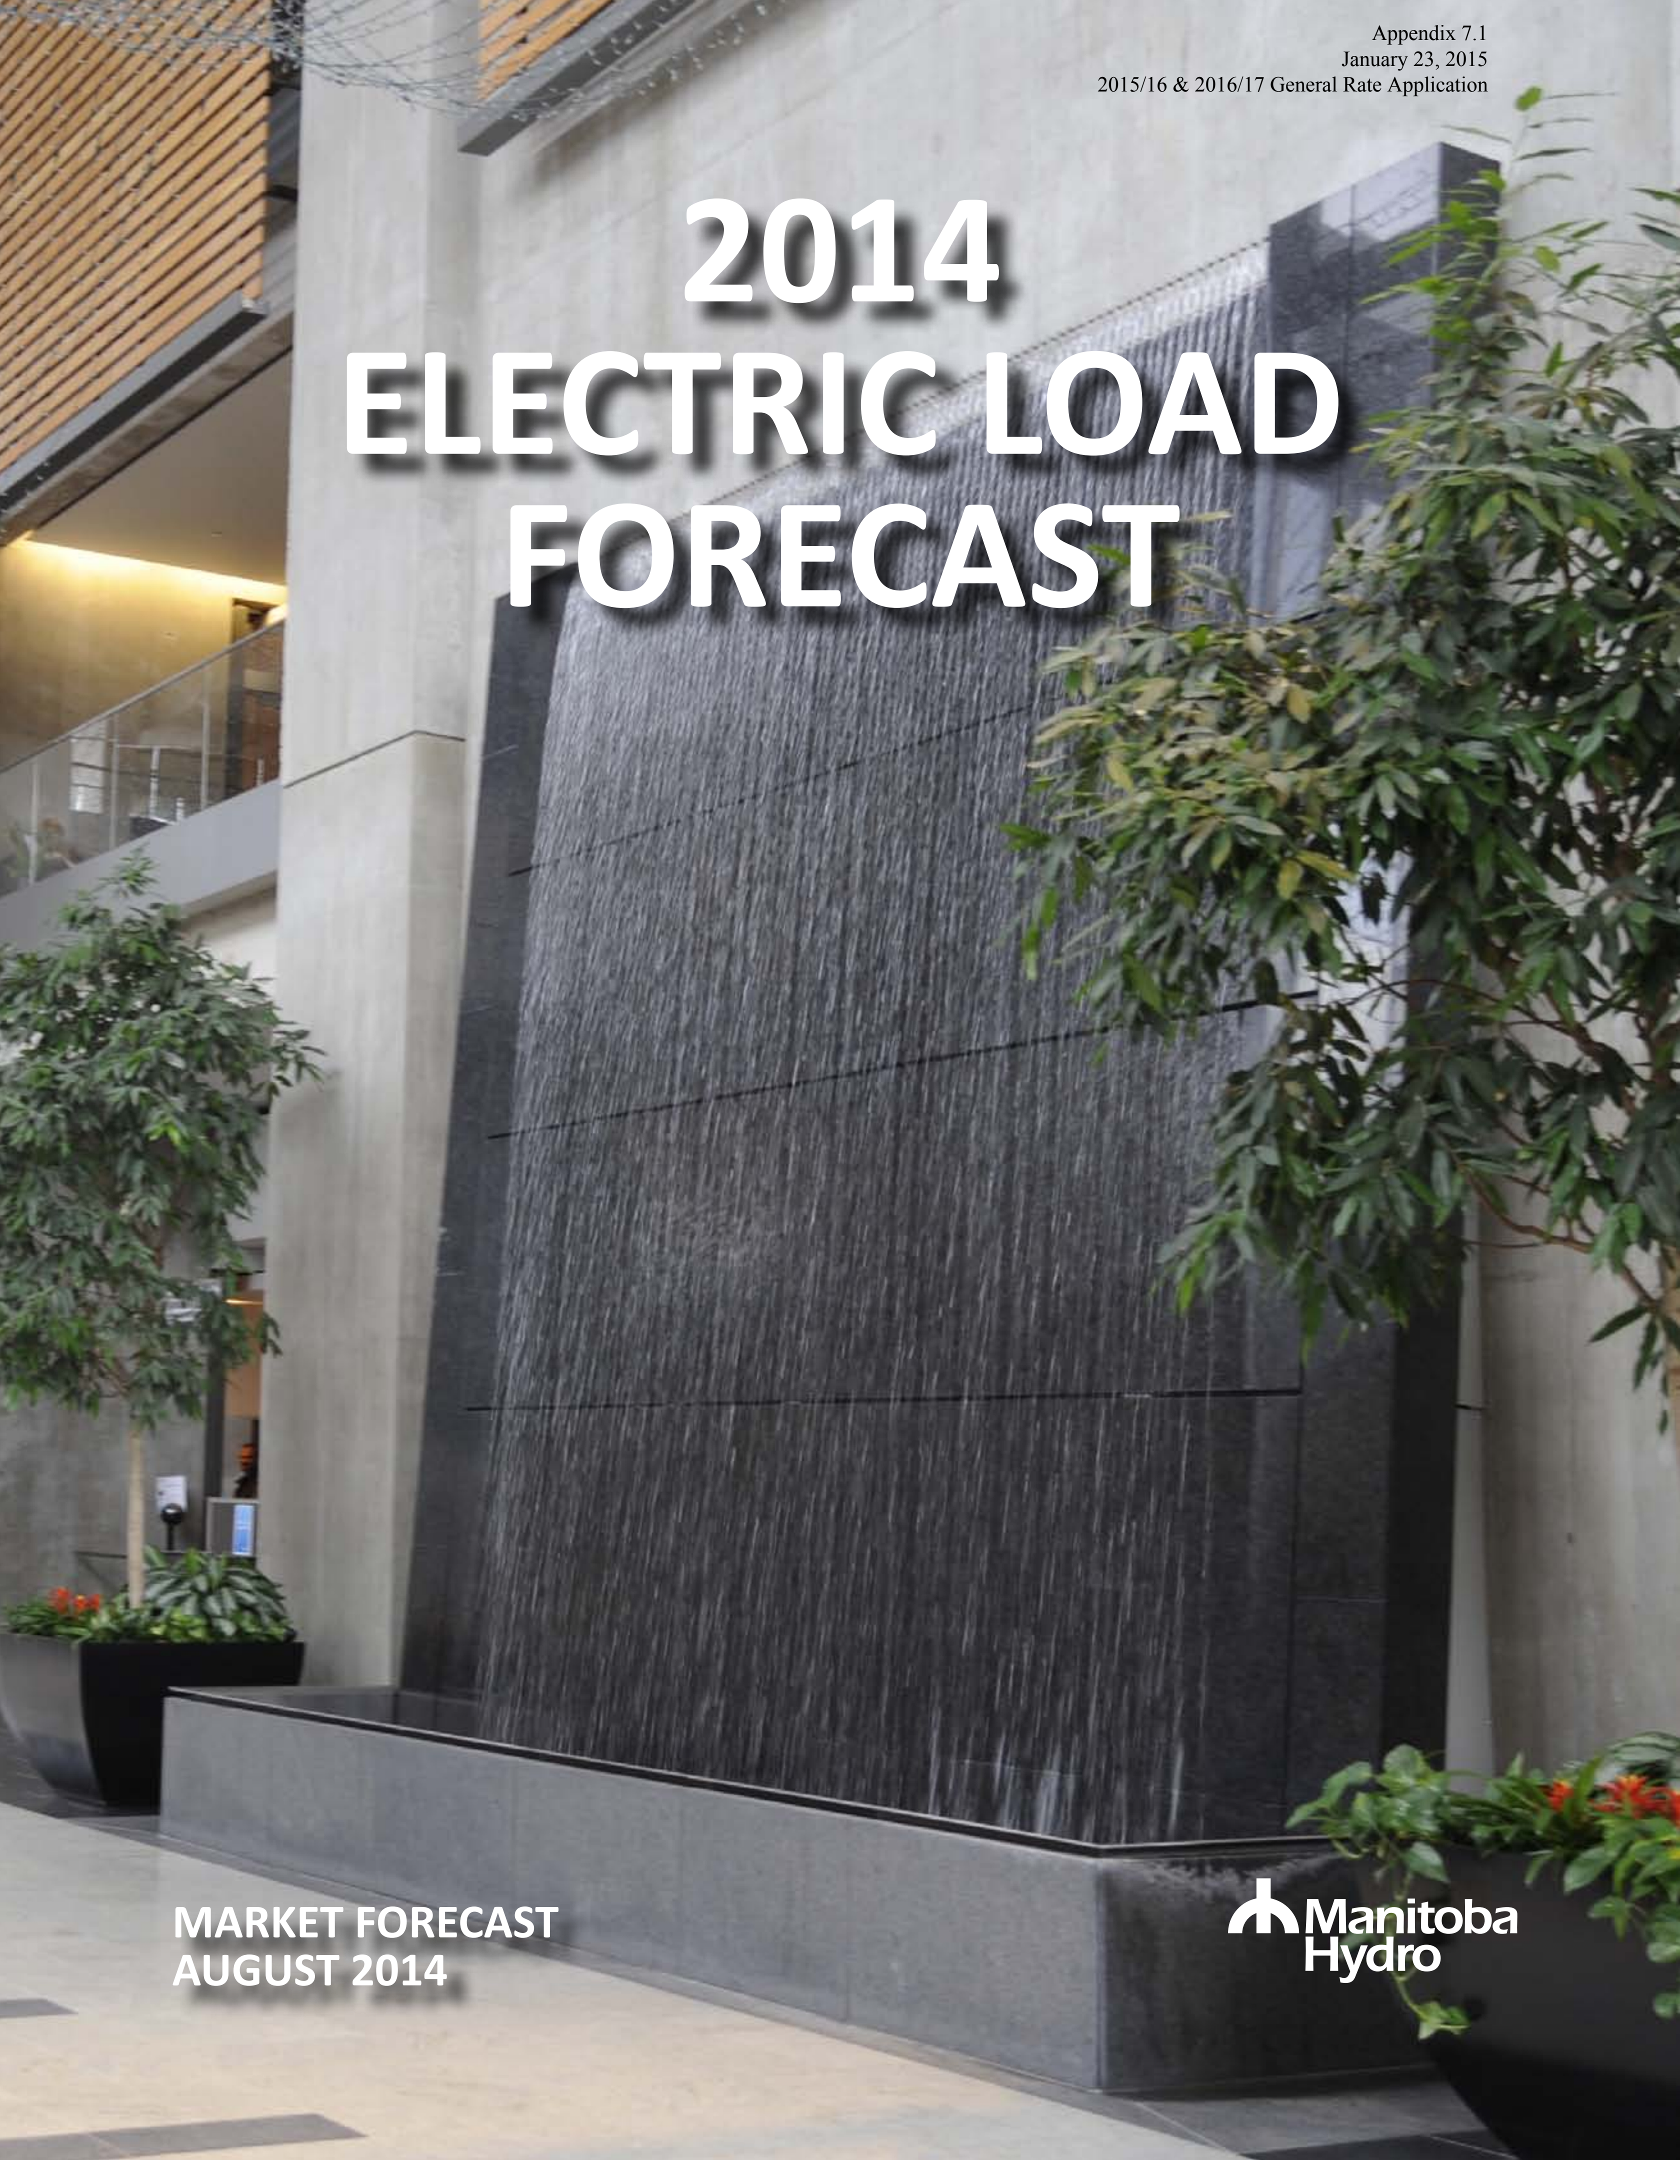
Figure 7.5 below provides a graphical representation of the historical and forecast of Gross Total Peak.

Figure 7.5- Gross Total Peak



Note: Peak forecast at generation.

2014 ELECTRIC LOAD FORECAST



MARKET FORECAST
AUGUST 2014

Manitoba Hydro

EXECUTIVE SUMMARY

Overview

The Gross Firm Energy in Manitoba is forecast to grow from a weather adjusted value of 24,677 GW.h in 2013/14 to 29,626 GW.h in 2023/24. This average growth is 495 GW.h or 1.8% per year for 10 years. By 2033/34, Gross Firm Energy is forecast to be 33,177 GW.h, a twenty-year growth rate of 425 GW.h or 1.5% per year.

Gross Total Peak is forecast to grow at about the same pace, growing 81 MW or 1.6% a year for the next 10 years, and 70 MW or 1.3% a year for the next 20 years. In 20 years, the peak will grow 1,408 MW to 5,995 MW.

Growth is expected in all sectors. The 20 year growth rates in the Residential Basic, General Service Mass Market and General Service Top Consumers sectors are forecast to be 1.2%, 1.4% and 2.0% respectively.

During the last 10 years, Gross Firm Energy has grown 269 GW.h or 1.2% per year. This ten year period includes the 2009 economic downturn that slowed growth.

The primary driver of growth in Manitoba is the population, with the secondary driver being the economy. Manitoba Hydro's 2014 Economic Outlook provides both the forecast of the population and the resulting forecast of Residential Basic customers that is used in this document. The population of Manitoba has grown from 1,166,000 people in 2003/04 to 1,269,000 people in 2013/14, averaging 0.9% growth per year. The forecast is that Manitoba's population will grow to 1,542,000 by 2033/34, averaging 1.0% per year. The primary reason for the expected increase of population growth in Manitoba is due to the Provincial Nominee Program which will continue to sustain moderate annual growth in immigrants.

Residential Basic customer growth is expected to mimic population growth, growing 1.0% per year over the next 20 years. An increase in average use per customer adds 0.2% to the growth and is primarily due to increased use of electric space and electric water heating in dwellings.

General Service Mass Market is forecast to grow at an average 1.4% per year, comparable to its historic growth of 1.4% per year over the past ten years.

General Service Top Consumers is forecast to grow at 2.0% per year. This is higher than its 0.1% growth per year during the past ten years which included the loss of a customer and an economic downturn. But it is less than the 3.5% growth per year during the prior ten years. Combined, the 20 year historical growth of the Top Consumers has been 1.9% per year. Short term committed loads include 1,194 GW.h of growth in the Pipeline sector, an expected top consumer load decrease of 494 GW.h, and other top consumer increases totaling 401 GW.h.

Change Between the 2013 and 2014 Forecast

The Gross Firm Energy in 2013/14 was 562 GW.h less than forecast in 2013 due to a temporary load loss of two Top Consumers. By 2019/20, the 2014 forecast is 850 GW.h higher due to increases to Top Consumers in the Pipeline sector and a higher Residential customer forecast in the earlier years. By 2032/33 the increase in the 2014 forecast is reduced to 129 GW.h due to an reduction in the Residential customer forecast and increases to the projected impacts of Codes and Standards. This equates to a 0.4% increase in the forecast of 2032/33, which represents a gain of less than half a year of load growth (1 year = approximately 425 GW.h).

The Gross Total Peak forecast in 2032/33 is down 28 MW compared to the 2013 Load Forecast, less than a half a year of load growth (1 year = approximately 70 MW).

Load Sensitivities and Extreme Events

The effect of alternate assumptions has been quantified for sensitivity or scenario analysis:

	Annual Energy Effect (GW.h)	Peak Effect (MW)
1% Increase/Decrease in Population	± 130	± 24
1% Increase/Decrease in Income and GDP	± 125	± 23
1% Increase/Decrease in Electricity Price	∓ 62	∓ 11
1% Increase/Decrease in Gas to Electricity Price Ratio	± 0.5	± 0.1
Climate Change per Degree Celsius Warmer	+ 23	- 47
If 0% or 100% of Residential had Electric Space Heat	-2,733, +4,796	-891, +1,564
If 0% or 100% Residential had Electric Water Heat	-892, +928	-102, +106
Increase/Decrease of One Very Large Industrial Customer	± 1,500	± 180
Maximum Potential Effect of Increased Online Shopping	- 846	- 156
Additional Load if 100% Electric Vehicle Saturation Rate	+ 4,172	+ 289
Illustrated Effect of Grid Parity (e.g. Solar Panels)	- 1,824	-104

(For comparison, 1 year of load growth is approximately 425 GW.h or 70 MW)

TABLE OF CONTENTS

LIST OF TABLES AND FIGURES

INTRODUCTION

This document is prepared annually as Manitoba Hydro's forecast of its future load requirements for its service area. The service area consists of all of Manitoba (99.85% of sales), as well as two resale customers that supply energy to Creighton, Sask. (0.12% of sales) and the Northwest Angle, Minn. (0.03% of sales). Exports of power to other utilities are not included.

This information is provided for several purposes. Short term forecasts of sales by billing month within rate groups are needed to forecast revenue for rate making, accounting and system operations. Long term forecasts of energy and peak is required by power planning to determine long term supply requirements.

A "customer" in this document refers to a metered electrical service. Unmetered services, such as flat rate water heating and sentinel rentals do not count as customers, and street lights group a number of services as one customer. A customer is not the same as a building. One building can have multiple electric services and may count as more than one customer, or multiple buildings may have only one service and may count as only one customer. A customer in this document is also not the same as a customer on the billing system. The latter is a person or organization that Manitoba Hydro serves. One billing customer may pay the bill for multiple services and thus count as multiple customers in this document.

Electric consumption is read from a customer's meter in units of kilowatt-hours (kW.h). A typical dwelling not using electricity for heating uses approximately 10,000 kW.h per year. This document reports electric use in terms of gigawatt-hours (GW.h). One GW.h equals one million kW.h, which is approximately the energy of 100 typical dwellings not using electricity for heating.

The highest load requirement for a time period is known as the peak load. It is given in terms of megawatts (MW). One MW equals one thousand kilowatts (kW). A typical dwelling not using electricity for heating would use a maximum of about 2.5 kW sometime during the year. However, dwellings will not all be at their maximum use at the same hour. The use of all dwellings at any specific hour is known as the coincident load. The coincident peak is the load at the hour of Manitoba's system peak. A typical dwelling not using electricity for heating would use about 1.6 kW at the coincident peak. Therefore 1 MW is approximately the coincident peak requirement of 600 typical dwellings not using electricity for heating.

Components of Manitoba's Electricity Use – 2013/14

General Consumers Sales (also referred to as Total Sales) includes the energy supplied to all of Manitoba Hydro's individually billed customers. Over the 2013/14 fiscal year, Manitoba Hydro averaged 552,660 General Consumers Sales customers who consumed 22,338 GW.h.

The major groups include

(1) Residential Basic, with 462,274 customers who used 7,767 GW.h or 34.8% of Sales. These are mostly residences that include single-family dwellings, multi-family dwellings and individual apartment suites.
(2) General Service Mass Market, with 66,569 customers who used 8,839 GW.h or 39.6% of Sales. These are small to large Commercial and Industrial customers.
(3) General Service Top Consumers, with 31 customers who used 5,461 GW.h or 24.4% of sales. These are 17 high-usage companies (some count as multiple customers) that are forecast individually.

The remaining customers include Seasonal customers (billed twice a year rather than monthly), Diesel customers (four remote towns not connected to the integrated grid system), Flat Rate Water Heating and Area and Roadway Lighting. Their electricity use totals only 271 GW.h or 1.2% of Total Sales. Over 50,000 of these services do not count as customers.

Manitoba Load at Common Bus is the total load metered at all the substations in the province that supplies Manitoba Hydro's non-Diesel customers and includes Distribution Losses and Construction Power. In 2013/14, Common Bus was 23,541 GW.h or about 5.4% more than Total Sales.

Gross Firm Energy is the total load needed to be generated for domestic firm load requirements on the Integrated System (excludes diesel). It includes Transmission Losses and Station Service. Some customers are on non-firm contracts (Surplus Energy Program), and their load is not included as part of Manitoba Hydro's generation requirement. In 2013/14, Gross Firm Energy was 25,625 GW.h or about 14.7% more than Total Sales.

FORECAST OVERVIEW

General Consumers Customer Forecast

In 2013/14, Manitoba Hydro had an average of 552,438 General Consumer Sales customers. These were made up of 462,274 Residential Basic customers, 66,569 General Service Mass Market customers, 31 General Service Top Consumers customers and 28 SEP (Surplus Energy Program, i.e. non-firm) customers, with the rest being Diesel, Seasonal and Area and Roadway Lighting.

During the last 10 years, Residential Basic customers have grown at an average of 4,558 (1.0%) per year. Manitoba Hydro's 2014 Economic Outlook provides the forecast of Residential Basic customers, and this document uses that forecast. It calls for a growth of 5,906 (1.2%) per year over the next ten years and 5,069 (1.0%) per year over the next 20 years. The primary reason for the increase is an expectation of increased population growth in Manitoba due to government immigration initiatives which will impact both the Residential and Commercial Sectors.

General Service Mass Market customers have grown 590 (0.9%) per year over the last 10 years. They are forecast to grow 546 (0.8%) over the next ten years and 446 (0.6%) over the next 20 years.

Residential Seasonal customers, who are mainly cottages with lower usage, are growing at a slower rate than Residential Basic, averaging 70 (0.3%) customers per year over the last 10 years. They are forecast to grow at 96 (0.5%) over the next 10 years and 98 (0.5%) over the next 20 years.

Area and Roadway Lighting customers were re-grouped in 2006 when Manitoba Hydro changed its billing system, and the lighting customer counts changed at that time. Area and Roadway Lighting is expected to grow at 5 (0.4%) customers annually over the next 10 years and 5 (0.4%) over the next 20 years.

General Consumers Sales Forecast

During 2013/14, Total General Consumer Sales was 22,338 GW.h. The fiscal billing year (using weather from March 16, 2013 to March 15, 2014) was much colder than normal giving a weather adjustment for the year of -772 GW.h, resulting in a weather adjusted Total Sales value of 21,566 GW.h.

Over the last 10 years, Total Sales have grown at 228 GW.h (1.1%) per year. The growth was 1.6% per year in Residential Basic, 1.4% per year in General Service Mass Market, but only 0.1% in General Service Top Consumers due to the economic downturn in 2009 that included the loss of one Top Consumer customer. This historical growth includes the effect of past Demand Side Management (DSM) initiatives.

Sales are forecast to grow at 444 GW.h (1.9%) per year over the next 10 years and 378 GW.h (1.5%) per year over the next 20 years before accounting for future market-based DSM programs.

Most of the growth is forecast to occur in General Service Mass Market, growing 142 GW.h (1.4%) per year over the next twenty years, followed by Top Consumers at 132 GW.h (2.0%) per year and Residential Basic at 102 GW.h (1.2%) per year.

Manitoba Energy Forecast

The actual Gross Firm Energy was 25,625 GW.h in 2013/14. Gross Firm Energy has grown 269 GW.h (1.2%) per year for the past 10 years. This historical growth reflects the effect of past Demand Side Management (DSM) initiatives. Gross Firm energy is forecast to grow to 33,177 GW.h by 2033/34 at an average growth of 425 GW.h or 1.5% per year. This is before accounting for future market-based DSM programs.

Distribution losses, which is the difference between Manitoba Hydro's substations and the customers' meters, has a wide variance from year to year and has ranged between 3.5% and 5.5% of Total Sales. It is forecast to be 4.4% of Sales for the entire forecast.

Transmission Losses which is the difference between the generators and the substations is forecast to be 9.2% of Total Sales for the entire forecast.

Distribution Losses and Transmission Losses total almost 14% which needs to be added to Total Sales to estimate Gross Firm Energy. This 14% value should generally be used to estimate load at generation when only load at the customer's meter is known, for example to convert Power Smart program savings from the customer meter to generation. The exception is for large General Service customers who own their own transformation and incur minimal Distribution Losses. For these customers, a 10% value should be used.

Table 6 - Components of Manitoba Energy

MANITOBA FIRM ENERGY (GW.h)
History and Forecast
2003/04 - 2033/34

Fiscal Year	General Consumer Sales less Diesel	Dist. Losses	Dist. Loss %	Const. Power	Manitoba Load at Common Bus	Trans. Losses	Trans. Loss %	Less Non Firm Energy	Station Service	Gross Firm Energy

Comparison of the 2013 Forecast to Actuals

Comparison of the 2013 Forecast to the 2013/14 Weather Adjusted Actuals

The weather adjusted General Consumer Sales for 2013/14 was 21,566 GW.h which was 510 GW.h lower than the 2013 forecast of 22,076 GW.h.

The weather adjusted Residential Basic sector was 90 GW.h lower than the forecast and the weather adjusted General Service Mass Market sector for was 37 GW.h higher than forecast. These differences do not take into account Demand Side Management (DSM) programs that were forecast to be 25 GW.h for Residential Basic and 56 GW.h for General Service Mass Market. With DSM incorporated, Residential Basic was 65 GW.h lower than forecast and General Service Mass Market was 93 GW.h higher than forecast.

The majority of the difference was in the Top Consumers sector for 2013/14 using 5,461 GW.h that was 464 GW.h lower than the 2013 forecast of 5,925 GW.h. Three Top Consumers contributed to the majority of this difference. Two had unexpected reductions of load in 2013/14 that are expected to be mostly restored in 2014/15. The third had a delay to a current expansion project but the forecast load is still expected and is included in the 2014 Forecast.

Distribution losses were 125 GW.h higher than forecast and Transmission losses were 159 GW.h lower than forecast.

Overall, the weather adjusted Gross Firm Energy for 2013/14 was 24,677 GW.h which was 562 GW.h lower than the 2013 forecast of 25,239 GW.h.

The normalized Gross Total Peak for 2013/14 was 4,587 MW, 28 MW higher than forecast.

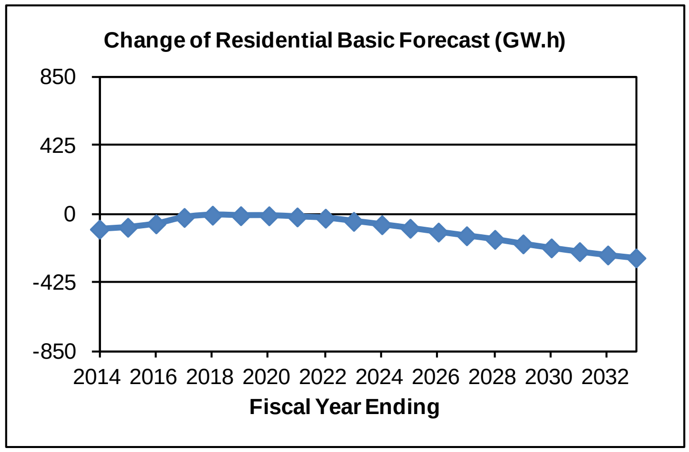
*Note: Actuals include DSM. Forecast excludes program-based DSM initiatives.

Change between the 2013 and 2014 Forecasts

Change Between the 2013 and 2014 Residential Basic Forecast

Figure 1 - Change of Res Basic Forecast



The 2014 Residential Basic Forecast starts down 78 GW.h from the 2013 forecast. By 2017/18, it is only down 3 GW.h due to a higher customer forecast in the earlier years. The difference then grows to be 268 GW.h down due to a lower customer forecast for the later years. 268 GW.h represents less than 1 year of Manitoba system load growth (1 year = approximately 425 GW.h).

Major changes and their 2032/33 effect:

1. The customer forecast was lowered by 4,854 (-80 GW.h).
2. Estimates of the reduction due to future Codes & Standards was increased (-384 GW.h).
3. Change to average use due to implementation of econometric model (+200 GW.h), from:
   a. Historical growth excluding evaluated DSM and Codes & Standards: +447 GW.h
   b. Increase due to the modeling of real Income: +628 GW.h
   c. Decrease due to the modeling of real electricity price: -875 GW.h
4. Modeling of ratio of gas to electric price on new home saturations (-33 GW.h)

Table 8 - Change of Res Basic Forecast

CHANGE OF RESIDENTIAL BASIC FORECAST (GW.h) Comparison of 2013 to 2014 forecast

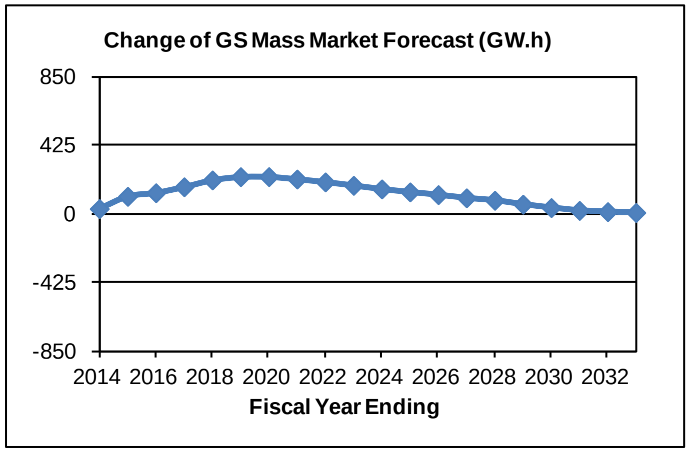
Change Between the 2013 and 2014 GS Mass Market Forecast

Figure 2 - Change of GS Mass Market Forecast



The 2014 General Service Mass Market Forecast is up 235 GW.h in 2018/19 from the 2013 forecast primarily due to the increase in the short term Residential customer forecast. By 2032/33, the Mass Market forecast is only up 13 GW.h by 2032/33.

Major changes and their 2032/33 effect:

1. The forecast of GS Mass Market customers was lowered by 1,046 due to a lower GDP forecast and a lower Residential Customer forecast (-138 GW.h).
2. Estimates of the reduction due to future Codes and Standards was increased (-517 GW.h)
3. Change to average use due to implementation of econometric model (+637 GW.h), from:
   a. Growth of historical average use due to adding DSM and Codes & Standards: +423 GW.h
   b. Increase due to the modeling of real GDP: +997 GW.h
   c. Decrease due to the modeling of real electricity price: -783 GW.h

Table 9 **- Change of GS Mass Market Forecast**

CHANGE OF GS MASS MARKET FORECAST (GW.h) Comparison of 2013 to 2014 forecast										
Fiscal Year	2013 Fcst	2014 Fcst	Change	%		Fiscal Year	2013 Fcst	2014 Fcst	Change	%

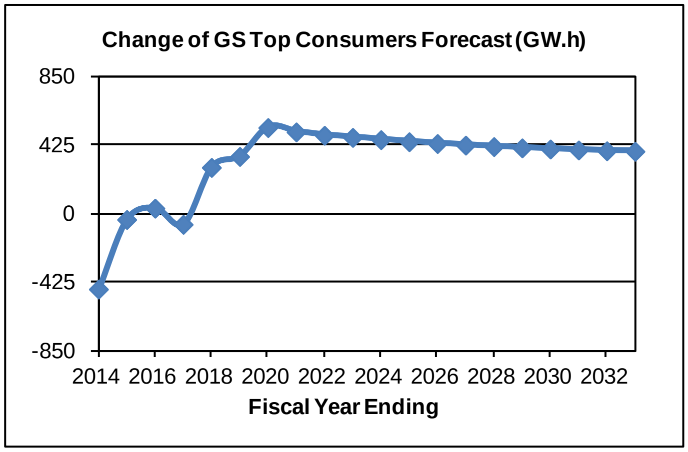
Change Between the 2013 and 2014 GS Top Consumers Forecast

Figure 3 - Change of GS Top Consumer Forecast



The General Service Top Consumers is similar to the 2013 forecast for the first three years, and then rises to be 537 GW.h higher in 2019/20 primarily due to pipeline projects. From 2020/21, the change slowly decreases due to a reduction to the annual amount allocated to the Potential Large Industrial Loads. By 2032/33, the increase is 390 GW.h. This is less than a year of Manitoba system load growth (1 year = approximately 425 GW.h).

Changes made (and the 2032/33 effect):

1. Load was down 464 GW.h in 2013/14 due to a temporary equipment problem with one top consumer and an unexpected reduction of a second top consumer. (-50 GW.h)
2. Two major expansion projects are expected in the Pipeline sector. (+655 GW.h)
3. The Potential Large Industrial Loads forecast was reduced from an average 100 GW.h per year to 91 GW.h per year. (-159 GW.h)
4. Potential Large Industrial Loads begins in the 4th year of the forecast, which in the 2014 forecast is one year later giving one less year of PLIL growth by 2032/33. (-98 GW.h)

Table 10 - Change of GS Top Consumer Forecast

CHANGE OF GS TOP CONSUMERS FORECAST (GW.h) Comparison of 2013 to 2014 forecast										
Fiscal Year	2013 Fcst	2014 Fcst	Change	%		Fiscal Year	2013 Fcst	2014 Fcst	Change	%

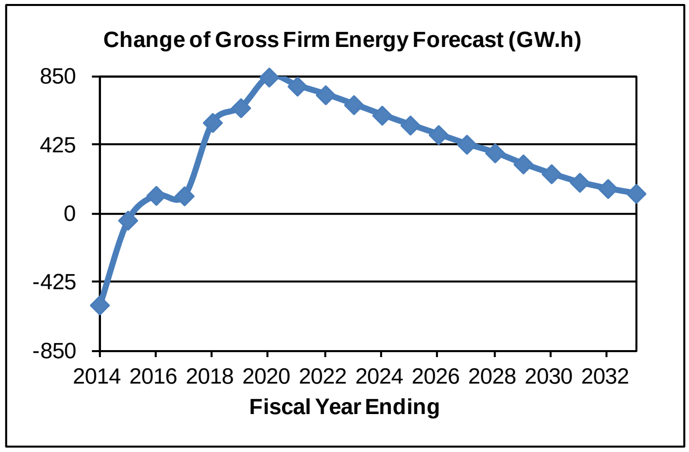
Change Between the 2013 and 2014 Gross Firm Energy Forecast

Figure 4 - Change of Energy Forecast



The Gross Firm Energy forecast was down 562 GW.h in 2013/14 due to a temporary load loss of two Top Consumers. By 2019/20, the 2014 forecast is 850 GW.h higher due to increases to Top Consumers in the Pipeline sector and a higher Residential customer forecast in the earlier years. By 2032/33 the increase in the 2014 forecast is reduced to 129 GW.h due to a reduction in the Residential customer forecast and increases to the projected impacts of Codes and Standards. This equates to a 0.4% increase in the forecast of 2032/33, which is a gain of less than half a year of load growth (1 year = approximately 425 GW.h).

Summary of changes made in each sector (and the 2032/33 effect):

1. Residential Basic forecast, primarily due to an overall reduction in the Residential customer forecast and projected energy savings due to Codes and Standards. (-268 GW.h)
2. General Service Mass Market forecast, due to mostly offsetting changes. (+13 GW.h)
3. General Service Top Consumers forecast, mostly in the Pipelines sector. (+390 GW.h)
4. Other Sales and Losses. (-6 GW.h)

Table 11 - Change of Energy Forecast

GROSS FIRM ENERGY (GW.h) Comparison of 2013 to 2014 forecast										
Fiscal Year	2013 Fcst	2014 Fcst	Change	%		Fiscal Year	2013 Fcst	2014 Fcst	Change	%

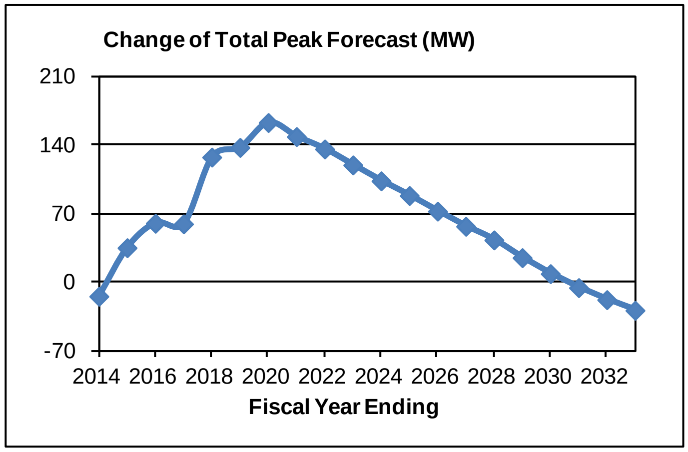
Change Between the 2013 and 2014 Gross Total Peak Forecast

Figure 5 - Change of Peak Forecast



The Gross Total Peak forecast is down 28 MW (0.5%) by 2032/33 from the 2013 forecast. The peak forecast very closely follows the energy forecast with the reasons for reduction in peak being similar to those for energy.

In 2032/33 the peak forecast is lower than projected in the 2013 forecast because of a small increase of the expected peak load factor which is forecast to grow to 63.2% compared to 62.6% in the 2013 forecast. The Load Factor increase is due to the Top Consumers forecast growing at a faster rate than other sectors.

The reduction in peak in 2032/33 amounts to 28 MW, less than a half a year of load growth. (1 year = approximately 70 MW).

Table 12 - Change of Peak Forecast

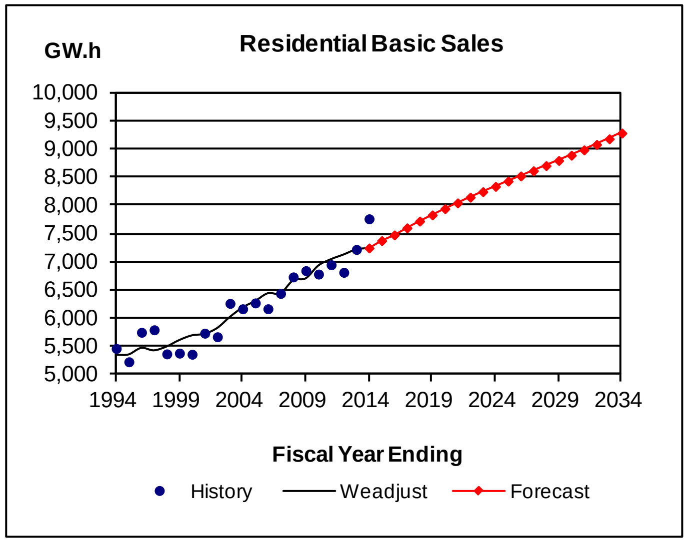
FORECAST DETAILS

Residential Basic

Figure 6- Residential Basic Sales



In 2013/14, there were 462,274 Residential Basic customers. 79% are single detached, 9% multi attached, and 12% individually metered apartment suites. 54% are in Winnipeg where natural gas is available, 29% in natural gas available areas outside Winnipeg, and 17% do not have natural gas available.

Residential Basic has grown 100 GW.h (1.6%) per year for the past 20 years and 106 GW.h per year (1.6%) for the past 10 years which reflects the effect of past Demand Side Management (DSM) initiatives. It is forecast to grow 109 GW.h (1.4%) per year for the next 10 years and 102 GW.h (1.2%) per year for the next 20 years.

The primary drivers of Residential Basic growth are population and average use per customer. The population is forecast to grow 1.2% per year over the next 10 years and 1.0% over the next 20 years. The increase in average use per customer is expected to add 0.2% to the growth.

Table 13 - Residential Sales

Electric Heat Billed: Customers who have electric space heating included with their electric bill.
Non Electric Heat Billed: Customers who do not have electric space heating included with their electric bill.
% Electric Space Heat: The proportion of Total Basic customers who are Electric Heat Billed.
% Electric Water Heat: The proportion of Total Basic customers who have Electric Water Heaters.

The average use (kW.h/customer) for Electric Heat Billed customers is decreasing as individually metered apartment suites are making up a higher proportion of the growth. The average use for Non Electric Heat Billed customers is increasing mainly due to the increase in the use of electric water heaters, the increase due to ventilation requirements in new dwellings, and miscellaneous end uses.

Residential Diesel, Seasonal, and Flat Rate Water Heating

Residential Diesel

There were 583 Residential Diesel customers that used 9 GW.h in 2013/14 at an average of 14,791 kW.h per customer. They have 60 amp service that does not allow for electric space heating. Space heating in these four communities is mainly provided by fuel oil. The number of customers is expected to grow to 740 and usage is expected to increase 2.0% a year to 13 GW.h by 2033/34 under the assumption that the communities continue to be separate from the Integrated System.

Residential Seasonal

There were 20,757 Residential Seasonal customers that used 92 GW.h in 2013/14 at an average of 4,455 kW.h per customer. The number of customers is expected increase to 22,714 customers by 2033/34. Seasonal customers are billed only twice a year either due to low usage (being a seasonal residence or cottage) or because of a location that makes it difficult to access for more frequent meter readings. The usage of Residential Seasonal customers is expected to increase 1.6% a year to 127 GW.h in 2033/34.

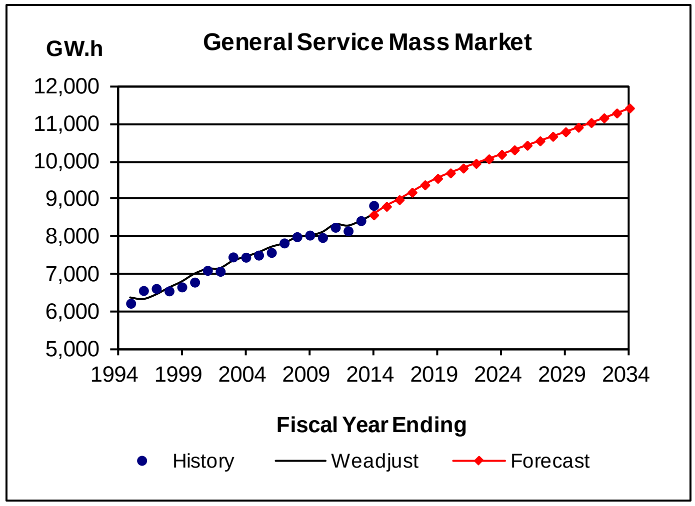
Residential Flat Rate Water Heating

Residential Water Heating is a flat rate unmetered service. This service has not been available to new customers since November 12, 1969. There were 3,858 remaining services in 2013/14. The number of services and usage is expected to decrease 5% per year throughout the forecast period. Usage was 20 GW.h in 2013/14 and that will decrease to 7 GW.h by 2033/34.

General Service Mass Market

General Service Mass Market includes all Commercial and Industrial customers, excluding the General Service Top Consumers. There were 66,569 General Service Mass Market customers in 2013/14. Approximately 85% are Commercial and the others are Industrial.

Figure 7 - General Service Mass Market



GS Mass Market has grown 117 GW.h (1.6%) per year for the past 20 years and 114 GW.h per year (1.4%) for the past 10 years. This historical growth reflects the effect of past Demand Side Management (DSM) initiatives. It is forecast to grow 161 GW.h (1.7%) per year for the next 10 years and 142 GW.h (1.4%) per year for the next 20 years.

The primary driver for growth in the GS Mass Market is the number of Residential Basic customers. As population grows, commercial and industrial services grow to service the population. The secondary driver is the economy. Changes in the Manitoba Gross Domestic Product (GDP) are reflected in the GS Mass Market's electricity use.

Table 15 - General Service Mass Market

GENERAL SERVICE MASS MARKET (GW.h) HISTORICAL/WEATHER ADJUSTMENT/FORECAST

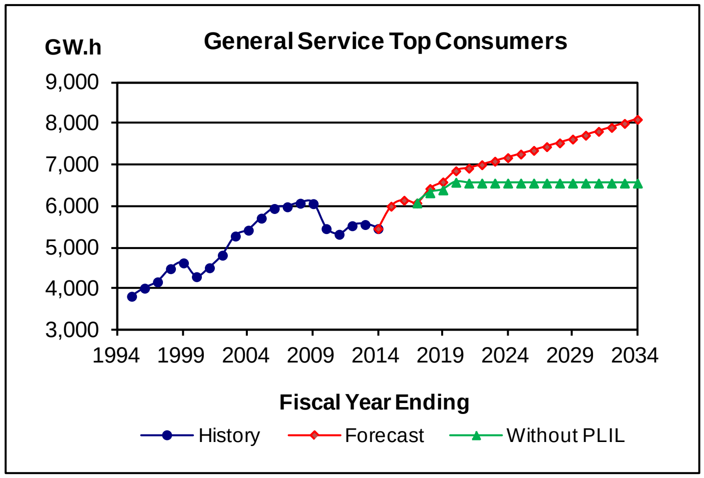
General Service Top Consumers

General Service Top Consumers includes the top energy consuming businesses in Manitoba and represents 25% of all General Consumers Sales. GS Top Consumers includes 17 companies that account for 31 customers in the Primary Metals, Chemicals, Petrol/Oil/Natural Gas, Pulp/Paper, Food/Beverage and Colleges/Universities sectors.

Figure 8 - General Service Top Consumers



GS Top Consumers has grown 86 GW.h (1.9%) per year over the past 20 years and but only 4 GW.h per year (0.1%) over the past 10 years. The loss of one Top Consumer and the effect of the economic downturn from 2008 to 2011 lowered the past 10 year growth rate. The 2014 forecast is expected to grow 172 GW.h (2.8%) per year for the next 10 years and 132 GW.h (2.0%) per year for the next 20 years. The short term increase is primarily due to planned expansions in the Petrol/Oil/Natural Gas sector. In the long term, GS Top Consumers is expected to grow at a rate dependent on the Canada and U.S. Gross Domestic Product (GDP) projections.

Table 16 - General Service Top Consumers

GENERAL SERVICE TOP CONSUMERS (GW.h) HISTORICAL/FORECAST WITH PLIL					
Fiscal Year	Sales	Fiscal Year	Individual	PLIL	Total

2012/13	5,560	2032/33	6,562	1,443	8,005
2013/14	5,461	2033/34	6,562	1,541	8,103

GS Top Consumers are forecast individually as their usage does not grow in a slow, steady, predictable pattern. Their short term outlooks are not conducive to econometric forecasting models and must be examined on an individual basis. The forecast for each company includes their short term committed plans and expectations over the next several years, but excludes longer term plans that are uncommitted and subject to change.

The sum of the individual company forecasts grow from 5,461 GW.h in 2013/14 to 6,582 GW.h by 2019/20. This growth of 1,121 GW.h includes the load changes due to committed plans of companies, and also includes an expected major load decrease of one customer by 2016.

Top Consumers do not add small amounts of load on a regular interval basis. Instead, they make major changes that add or remove a large amount of load at one time. Load changes are related to individual business cycles and it may be years between one of these changes.

For the longer term, an average expected growth is included for all customers together. This added growth is called Potential Large Industrial Loads (PLIL). It includes consideration for company expansions, cutbacks and shutdowns, new startups of 100 GW.h a year or more, and the long term normal incremental growth of all the companies within the Top Consumers sector combined. Since customer intentions are generally known for the first three years, PLIL is not added until 2017/18, the fourth year of the forecast.

GS Top Consumers has grown an average of 86 GW.h (1.9%) per year over the past twenty years. During that time, there were four new customers totaling 1,100 GW.h, nine instances of major customer expansions totaling 1,400 GW.h, and two existing customers who closed operations reducing consumption by 700 GW.h. None of these events could have been predicted five years before they occurred. One new customer and four expansions occurred within the past 10 years despite the economic downturn. These major events amount to a net 1,800 GW.h increase or 90 GW.h annually over the past 20 years. PLIL is estimated econometrically and averages 91 GW.h (1.3%) per year starting in the fourth year of the forecast and will total 1,541 GW.h by 2033/34.

1,541 GW.h is approximately equivalent to the load of Manitoba Hydro's largest consumer. If only one other customer of similar size starts up in Manitoba within the next 20 years, this one new customer alone would consume all of the provision that PLIL has projected.

General Service Diesel, Seasonal, and Flat Rate Water Heat

General Service Diesel

In 2013/14, there were 179 General Service Diesel Full Cost customers. They used 5 GW.h in 2013/14. The group is forecast to use 7 GW.h by 2033/34.

General Service Seasonal

There were 861 General Service Seasonal customers in 2013/14. Consumption was 5 GW.h in 2013/14 and is expected to grow to 6 GW.h by 2033/34.

General Service Flat Rate Water Heating

General Service Water Heating is a flat rate unmetered service that has not been available to new customers since November 12, 1969. There were 392 remaining services in 2013/14. The number of services is expected to decrease 5% per year throughout the forecast period. Consumption was 7 GW.h in 2013/14 and that is forecast to decrease to 3 GW.h by 2033/34.

General Service Surplus Energy Program

Participants in the Surplus Energy Program (SEP) used 29 GW.h in 2013/14 and are expected to grow to use 33 GW.h per year by 2017/18 and continue at that rate for the remainder of the forecast. This energy is considered to be “interruptible” and thus “non-firm”. The energy used by these customers is included in Sales. But it is excluded from the Gross Firm Energy forecast.

Plug-In Electric Vehicles

This forecast includes an estimate of the future adoption of Plug-In Electric Vehicles (PEVs) in the Manitoba Hydro service area. This is made up of two types:

(1) Plug-In Hybrid Electric Vehicles (PHEVs) that run on an electric battery but use an internal combustion engine (ICE) when the electricity runs low. An example is the Chevrolet Volt.

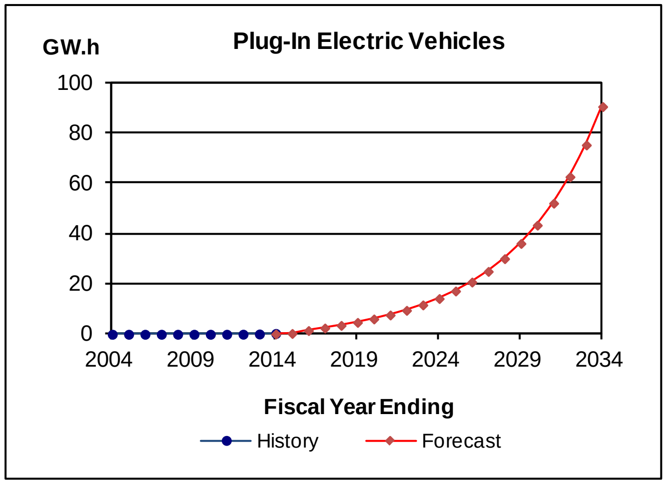
(2) Battery Electric Vehicles (BEVs) run only on electric battery power. Pure electric plug-in vehicles include the Nissan Leaf, the Tesla and Mitsubishi MiEV.

The forecast of PEVs does not include non-plug-in Hybrid Electric Vehicles (HEVs). These vehicles, such as the non-plug-in Toyota Prius, have an internal combustion engine as well as a battery and electric motor to drive the wheels. The HEV battery is charged with power from the ICE and through regenerative breaking. It is not charged by plugging in and therefore does not affect electricity consumption in Manitoba. As of March 1, 2014 and after 13 years in the market, there were only 3,960 HEVs registered in Manitoba, making up about 0.5% of all registered vehicles.

For the most part, the expected success of plug-in electric cars has not materialized worldwide. According to the Plug-In Hybrid & Electric Vehicle Research Center at UC Davis, total cumulative global sales of PHEV's and BEV's worldwide passed the 500,000 mark at the end of June, 2014. Out of the total global vehicle count of just over one billion, electric vehicles represent 0.05% of the total. The US accounts for about 45% of the total electric vehicle sales, while Japan is second, China third and the Netherlands fourth. While President Obama's goal of 1,000,000 electric vehicles on US roads by the end of 2015 seems unrealistic, according to the Centre for Solar Energy and Hydrogen Research Baden-Württemberg (ZSW), there will be over a million such vehicles on the road worldwide by the end of 2016. Range anxiety and price are cited as the main reasons for limited sales.

The Electric Vehicle Forecast

Figure 9 - Plug-In Electric Vehicles



As of March 1st, 2014, there were 67 plug-in electric passenger vehicles, plus the Manitoba Hydro Electric Bus, registered in Manitoba according to the Manitoba Public Insurance Corporation. The passenger electric vehicle registrations comprised of 27 pure electric plug-in vehicles and 40 plug-in hybrid electric vehicles. The 2013 Load Forecast had predicted a total of 103 plug-in vehicles to be registered in Manitoba at fiscal year ending 2014. The latest electric vehicle forecast is adjusted to incorporate the lower actual registrations recorded in fiscal year ending 2014. The number of new PEVs is expected to slowly increase until it reaches about 0.7% of new vehicle sales (415 per year) in 2023/24 and 4.1% of new vehicle sales (2,837 per year) in 2033/34. The total number of electric vehicles on the road is expected to be 2,057 (0.2% of total vehicle registrations) in 2023/24 and 15,910 (1.3% of total vehicle registrations) in 2033/34.

The following table provides the forecast of the number of new vehicles and total number of vehicles each year in Manitoba, as well as the corresponding numbers for Plug-In Electric Vehicles. Trailers, farm equipment and motor cycles are not included in the count. The forecast incorporates passenger as well as commercial category vehicles such as Sport Utility Vehicles (SUVs), trucks and transit buses. A passenger PEV consumes approximately 3,500 kW.h per year, equivalent to one residential electric hot water tank. An electric transit bus consumes 123,500 kW.h per year, equivalent to four electrically heated single detached dwellings.

Forecast energy usage for PEVs in Manitoba is expected to be 14 GW.h in 2023/24 and 91 GW.h in 2033/34. Forecast peak usage coincident to Manitoba Hydro’s system peak is expected to be 1.8 MW in 2023/24 and 11.3 MW in 2033/34.

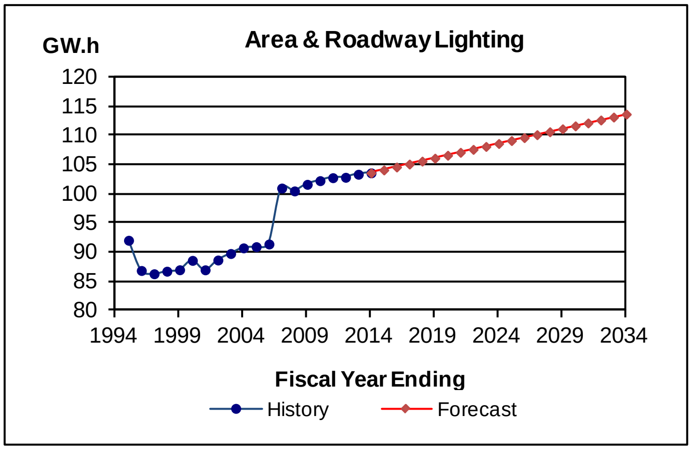
Area & Roadway Lighting

Figure 10 - Area & Roadway Lighting



The Area and Roadway Lighting sector represents 0.5% of all sales within Manitoba. This sector includes electricity sales for the Sentinel Lighting and Street Lighting rate groups. Sentinel Lighting is an outdoor lighting service where units are available either as rentals to an existing metered service or on an unmetered, flat rate basis. Street Lighting includes all public roadway lighting in Manitoba. Energy-efficient street lighting initiatives caused the significant drop in usage in the mid 1990's. In 2006, a readjustment of the rate classes moved some flat rate General Service meters into the Lighting sector. Only Street Lights count as customers.

The Area and Roadway Lighting sector is forecast to increase from 104 GW.h in 2013/14 to 114 GW.h by 2033/34 at an average growth rate of 1 GW.h or 0.5% per year. This does not include the effect of future Demand Side Management (DSM) initiatives in this sector.

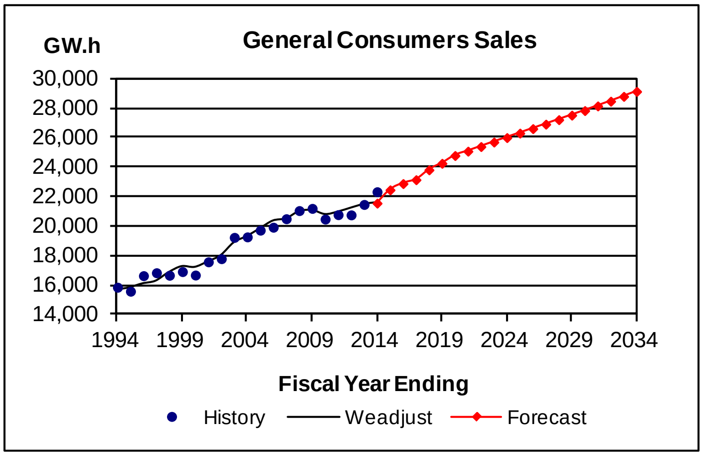
Total General Consumers Sales

Figure 11 - General Consumers Sales



General Consumers Sales includes sales to all of Manitoba Hydro's individually billed customers, but excludes export sales. This includes the total of all sales from the Residential, General Service and Lighting sectors. The General Service sector makes up about two-thirds, the Residential sector makes up about one-third and the Lighting group is only 0.5% of all sales.

Weather adjusted General Consumers Sales has grown 301 GW.h (1.6%) per year for the past 20 years and 228 GW.h (1.1%) per year over the past 10 years. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Sales are forecast to grow 444 GW.h (1.9%) per year for the next 10 years and 378 GW.h (1.5%) per year for the next 20 years.

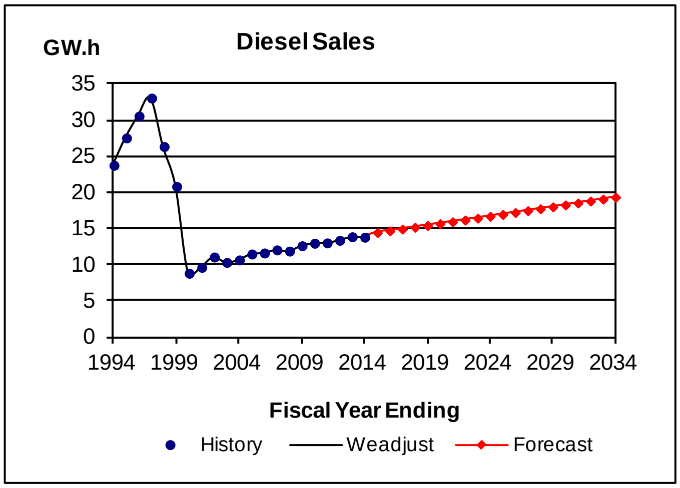
Diesel Sales

Figure 12 - Diesel Sales



There are four communities served by diesel generation in Manitoba: Brochet, Lac Brochet, Tadoule Lake and Shamattawa. Sales within these communities are included in General Consumers Sales, but are not part of the Integrated System, and are thus not part of Common Bus or Gross Firm Load.

Between 1997 and 1999, eleven communities previously served by diesel generation were connected to the Integrated System resulting in the drop in overall diesel sales. The four sites that were to remain diesel were converted from 15 amp service to 60 amp service between 1991 and 2001 causing the increase in those years.

Diesel customers do not have electric heat, which requires a minimum 200 amp service, therefore there is no weather effect.

Table 21 - Diesel Sales

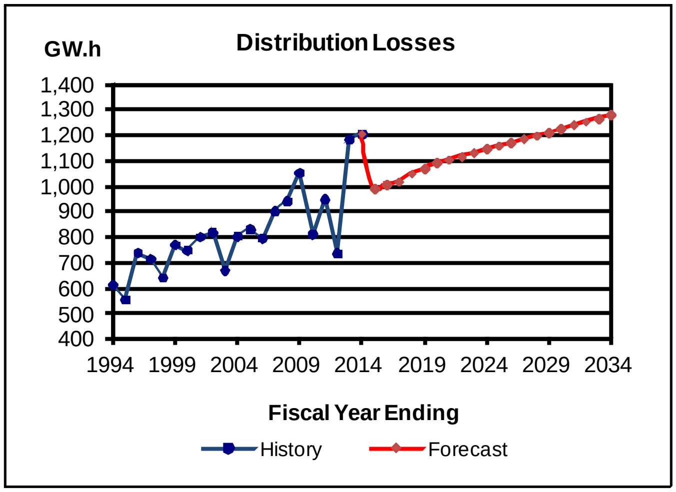
Distribution Losses

Figure 13 - Distribution Losses



Distribution Losses are made up of the power loss between the distribution substation (Manitoba Load at Common Bus less Construction) and the customer's meter (General Consumers Sales less Diesel), as well as all other differences between what was billed and what was metered. The other differences include:

1. The offset between cycle billing (General Consumers Sales) and actual calendar month usage (Common Bus).
2. Customer Accounting adjustments,
3. Inaccuracies associated with estimated billing (including flat rate estimates),
4. The metered but unbilled consumption of Manitoba Hydro offices, and
5. Energy lost due to theft.

Distribution Losses are forecast in 2014/15 to be 4.4% of the General Consumers Sales less Diesel and remain at that level throughout the forecast.

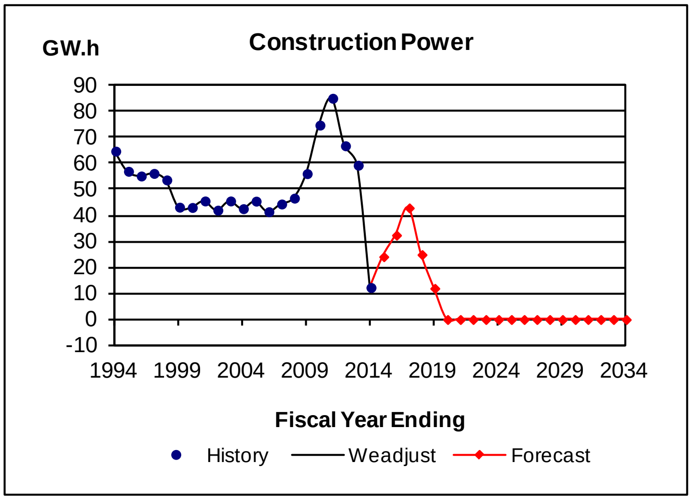
Construction Power

Figure 14 - Construction Power



Construction Power represents the energy used by Manitoba Hydro and its contractors in the construction of major capital works such as generating stations, converter stations and major transmission lines. Construction Power also includes Station Service until a plant is commissioned. Until 2013, about 48 GW.h of heating load at the Gillam, Limestone and Kettle town sites was included in Construction Power. This energy is now included in Distribution Losses.

The Construction Power forecast includes: (1) the Pointe Du Bois spillway replacement started in April 2013 with expected completion in the Fall of 2015, and (2) the Keewatinoow Converter Station, started in January 2012 with expected completion in the Fall of 2017. Construction Power does not include construction power estimates for Keeyask as they were not available at the preparation of this forecast.

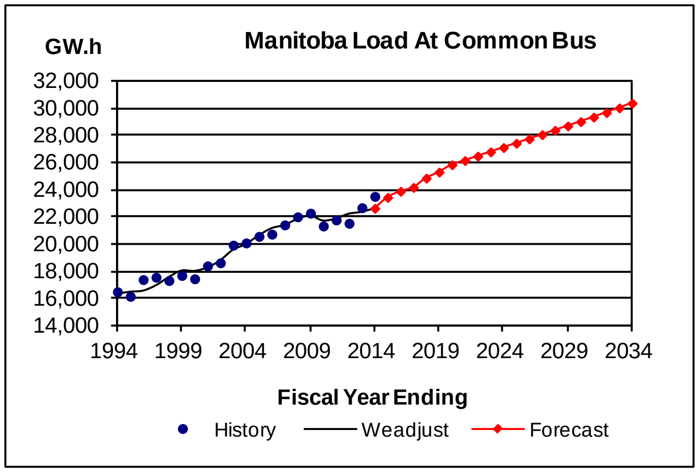
Manitoba Load at Common Bus

Figure 15 - Manitoba Load at Common Bus

Manitoba Load at Common Bus is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers, Construction Power plus associated Distribution Losses, but excludes Diesel customers, Transmission Losses and Station Service.



Common Bus is metered and totaled to correspond exactly to each calendar month. Weather adjustment is done on a calendar month basis.

Weather adjusted Common Bus has grown 321 GW.h (1.7%) per year for the past 20 years and 262 GW.h (1.2%) per year during the past 10 years reflecting the recent economic downturn. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Common Bus is forecast to grow 447 GW.h (1.8%) per year for the next 10 years and 387 GW.h (1.5%) per year for the next 20 years.

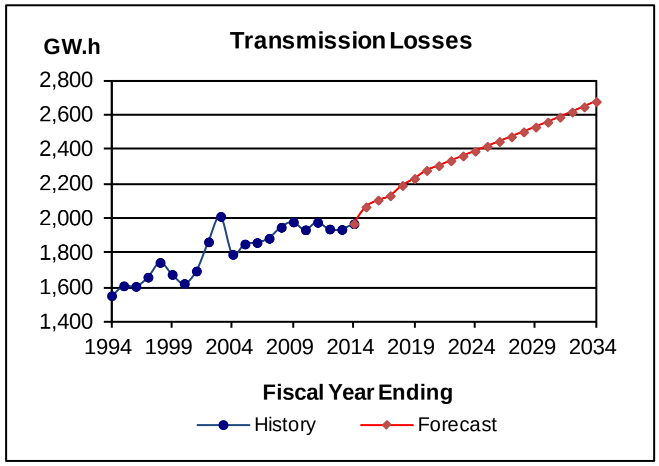
Transmission Losses

Figure 16 - Transmission Losses



Transmission Losses are the amount of energy lost while delivering power from the generation stations to all of the distribution substations that make up Common Bus. Transmission Losses only contains losses associated with supplying Manitoba customers. Losses attributable to exports and the gains attributable to imports are excluded. Transmission Losses are mostly losses on the High Voltage Direct Current (HVDC) lines, and are substantial because of the distance of transmission from northern generation to southern distribution points, but are much less than what AC losses would be over that distance. Transmission Losses vary year to year depending on water conditions, system configuration, outages and the magnitude of the load. Losses were higher in 2002/03 due to two HVDC transformer failures.

Transmission Losses are forecast to be 9.2% of the General Consumers Sales less Diesel Sales.

Table 25 - Transmission Losses

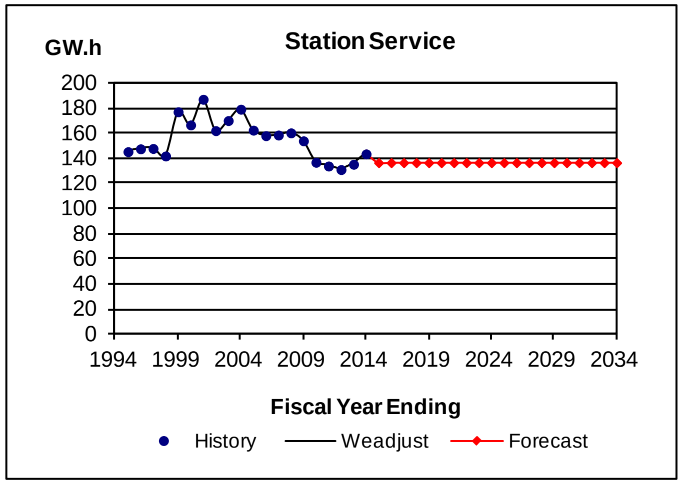
Station Service

Figure 17 - Station Service



Station Service is the energy used by power plants to generate power and service their own load. Manitoba energy or peak without Station Service is referred to as "Net", and with Station Service as "Gross". Station Service has only been reported since 1994.

Station Service energy is forecast to be 137 GW.h and Station Service peak is forecast to be 24 MW from 2014/15 to 2033/34.

Station Service for Keeyask and for future non-committed plants is excluded from this forecast.

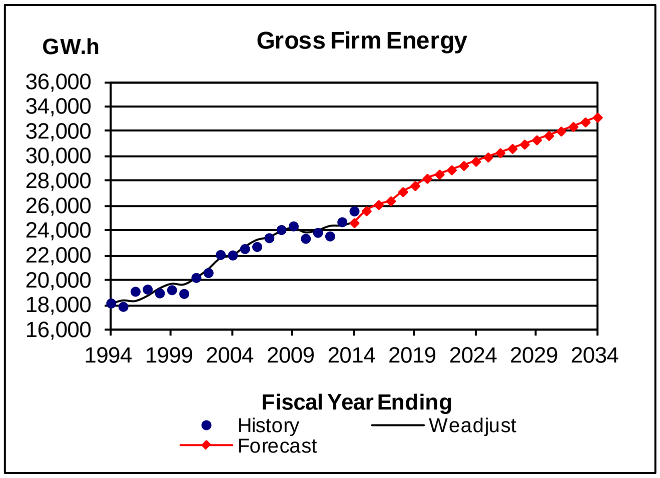
Gross Firm Energy

Figure 18 - Gross Firm Energy



Gross Firm Energy is the energy required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports, interruptible (non-firm) loads, Diesel Sales and Station Service for Keeyask and non-committed plants.

Gross Firm Energy has grown steadily during the past twenty years, except for the economic slowdown in the 1990's and more recently in 2009.

Weather adjusted Gross Firm Energy has grown 333 GW.h (1.6%) per year for the past 20 years and 269 GW.h (1.2%) per year during the past 10 years reflecting the recent economic downturn. This historical growth includes the effect of past Demand Side Management (DSM) initiatives. Energy is forecast to grow 495 GW.h (1.8%) per year for the next 10 years and 425 GW.h (1.5%) per year for the next 20 years.

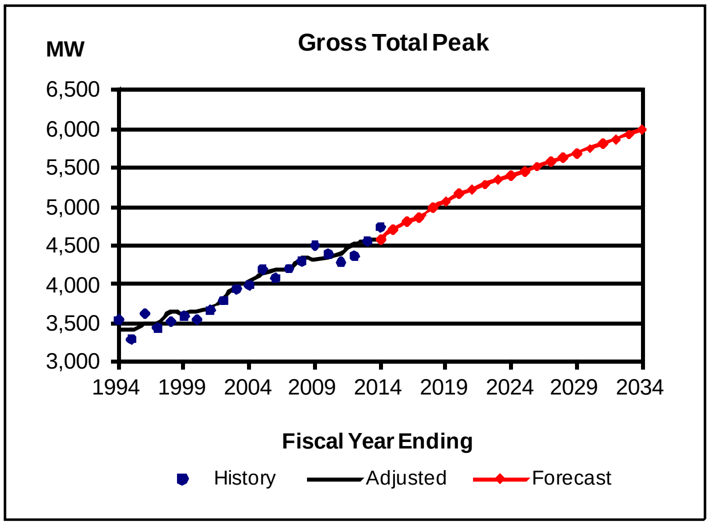
Gross Total Peak

Figure 19 - Gross Total Peak



Gross Total Peak is the maximum integrated (i.e. average) hourly load required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports and Diesel Sales. It includes Station Service and Curtailable Loads.

Typically, the peak occurs on a very cold winter weekday either in the morning (often from 8 a.m. to 9 a.m.) or in the afternoon (from 5 p.m. to 6 p.m.) Electric heating contributes by placing the peak on one of the coldest days, whereas the operation or lack thereof of large industrials often makes the difference as to the specific day and peak hour.

The adjusted Gross Total Peak has grown from 3,403 MW in 1994/95 to 4,587 MW in 2013/14 at an average growth of 62 MW or 1.6% per year. It is forecast to grow to 5,995 MW at 70 MW (1.3%) per year by 2033/34.

Peak load is measured and recorded differently than energy data. The system load at every hour is calculated by System Operations as:

Hourly Gross Total Peak (t)

= Hourly Total Generation (t)

- Hourly Metered Exports (t) + Hourly Metered Imports (t)

- Losses Associated with Exports (t) + Gains Associated with Imports (t)

+ Curtailments (t)

Losses for exports and gains for imports are only known on a monthly energy basis. The hourly value is obtained by using the ratio of exports/imports for the hour to the total exports/imports for the month and applying that to the total metered loss/gain for the month. The remaining difference between the balance of the load and Common Bus is taken as the Transmission Losses associated with Manitoba load.

Curtailments for individual customers are calculated as the difference between what the customer would have used if not curtailed versus what they did use. This is not the same as the calculation used for billing.

Annual Peak

The forecast annual peak is higher than the maximum of the monthly peaks. This is because the peak can occur in any one of the winter months. The same characteristic is apparent in historical peaks. The average historical annual peak is higher than the maximum of the highest average monthly peaks. For studies requiring yearly data, the annual peak should be used.

16 Hour Peak

The peaks in this document are integrated hourly peaks. For some studies and analysis of avoided cost or DSM savings, an estimate of the average peak during onpeak hours (from 6 a.m. to 10 p.m.) may be desired. To convert hourly peak to 16 hour peak, multiply the hourly peak in the associated month by the following percentages:

Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
94.4%	94.9%	95.8%	96.0%	96.3%	96.0%	96.6%	95.6%	95.8%	96.6%	95.6%	95.5%	94.8%

VARIABILITY AND ACCURACY

Weather Effect and Weather Adjustment

The weather effect is determined in any sector every year by regressing the previous two years of actual monthly energies against the actual DDH and DDC for the month. This results in a GW.h per DDH effect and a GW.h per DDC effect for that sector for that year.

Only sectors whose major variation is due to weather can have a weather effect estimated. Sectors that vary primarily due to industrial output levels or seasonal but non-weather reasons may yield false weather effects if estimated. Weather effects are not determined for the GS Top Consumers, Seasonal, Diesel, Water Heating and Lighting sectors.

For sectors where a weather effect is calculated, this document will show energy as the reported value and as a weather adjusted value. Forecasts are based on the weather adjusted values. The calculations are:

Weather Adjustment = DDH weather effect * (DDH actual - DDH normal)
+ DDC weather effect * (DDC actual - DDC normal)

Weather Adjusted Actual = Actual - Weather Adjustment

Following are the DDH and DDC weather effect factors by sector:

Residential Basic: 0.6 GW.h / DDH, 1.0 GW.h / DDC
GS Mass Market: 0.3 GW.h / DDH, 1.0 GW.h / DDC
General Consumers Sales: 0.9 GW.h / DDH, 2.0 GW.h / DDC
Gross Firm Energy: 1.1 GW.h / DDH, 2.5 GW.h / DDC
Gross Total Peak: 47 MW / degree (at -30 degrees Celsius),
103 MW / degree (at +30 degrees Celsius)

Effect of Extreme Weather

A record cold winter will increase load 4% and a record warm winter will decrease it 4%. An additional 2% load increase is possible due to a record hot summer and a 1% decrease due to a record cool summer.

The effect of extreme weather is larger on a monthly basis, and even larger on a daily basis.

		Effect of Weather due to Winter Extremes on Gross Firm Energy							
	GW.h/DDH	Normal		Record Warm			Record Cold		
	1.1	DDH	GW.h	DDH	GW.h	Effect	DDH	GW.h	Effect
Year:	2014/15	4,570	25,639	3,678	24,633	-4%	5,439	26,619	4%
Month:	Jan 2015	948	2,828	663	2,506	-11%	1,261	3,181	12%
Day:	Jan 2015	31	91	6	64	-30%	56	120	31%

		Effect of Weather due to Summer Extremes on Gross Firm Energy							
	GW.h/DDC	Normal		Record Cool Summer			Record Hot Summer		
	2.5	DDC	GW.h	DDC	GW.h	Effect	DDC	GW.h	Effect
Year:	2014/15	183	25,639	69	25,355	-1%	364	26,089	2%
Month:	July 2014	69	1,865	6	1,708	-8%	142	2,045	10%
Day:	July 2014	2	60	0	55	-9%	14	89	49%

The effect of a change in temperature on the load at the time of peak due to a 5 degree temperature difference is 16% in the summer and 5% in the winter.

Summer	Winter	Effect of Change in Temperature on Gross Total Peak							
MW/Deg	MW/Deg	Normal		Warm Winter, Cool Summer			Cold Winter, Hot Summer		
103	47	Temp	MW	Temp	MW	Effect	Temp	MW	Effect
Summer	2014/15	30	3,283	25	2,766	-16%	35	3,801	16%
Winter:	2014/15	-30	4,716	-25	4,481	-5%	-35	4,951	5%

Load Variability

Uncertainty is an inherent characteristic of forecasting. The load will vary both year to year and long term because of underlying changes in population growth, economic growth, changes in the operations of Top Consumers, and overall use patterns. An economic recession will slow energy growth and an economic boom will increase it. Cycles cannot be predicted in advance so some appropriate midpoint must be chosen as the forecast.

This forecast was created as Manitoba Hydro's best estimate of Manitoba's future energy requirement with an expectation of a 50% chance that actual growth will be higher than the forecast, and a 50% chance that actual growth will be lower than the forecast. This can also be called the P50 forecast.

To evaluate the potential for variation, historic load variability has been analyzed using a probabilistic-based approach. Doing this provides an estimate of the magnitude of the potential load variation from the forecast due to population, economy and other effects. 10% and 90% confidence bands (-/+ 1.28 standard deviations), also known as P10 and P90, were selected to be a proxy for the Low and High Load Forecast Scenarios for use in risk analysis studies. They are calculated as follows:

Load = Base Forecast -/+ 1.28 x Standard Deviation

For other probability points, substitute for the 1.28 the following numbers:

Prob	0.1%	2.5%	10%	20%	50%	80%	90%	97.5%	99.9%
Z(Prob)	-3.09	-1.96	-1.28	-0.84	0.00	0.84	1.28	1.96	3.09

This calculation gives the variability due to long term economic effects. It does not include variability due to weather which was removed through the use of weather adjusted load. The standard deviation of the weather variation has been found to be approximately 2% of both the energy and peak. Annual weather variations tend to be independent of the economy, so the variance due to weather can be added to the variance without weather to derive an overall variance that includes weather.

The following four charts and tables summarize the variability for energy and peak. By 2033/34, the Load Forecast has an 80% probability of being accurate to within ±2,163 GW.h or ±6.5%. Due to the inherent variability of the load, this is the best level of accuracy possible.

The overall economic standard deviation in 2033/34 is 1,688 GW.h or 5.1% of the forecast energy. Analyzed individually, the economic standard deviation of the Top Consumers sector is 1,229 GW.h (15.2%), Residential is 457 GW.h (4.9%) and Mass Market is also 457 GW.h (4.0%), showing that the Top Consumers sector is the majority of the variance.

5 and 10 Year Forecast Accuracy

Due just to the load variation caused by population growth and economic growth, there is only a certain level of accuracy possible. Using the load variability estimates of the previous section, it can be said that due to economic variability alone, there is less than a 50% chance that a 5 year energy forecast can be within 1.8% of the actual, and less than a 50% chance that a 10 year energy forecast can be within 2.5% of the actual.

Recognizing the inherent uncertainty of the forecast, historic forecast variation has been tracked. The following four figures and tables compare previous load forecasts to actual results 5 and 10 years later.

The energy savings achieved under Manitoba Hydro's market-based DSM programs between the year the forecast was prepared and the year being forecast was subtracted first from the forecast value. The difference is taken as the accuracy of the forecast.

The following figures and tables may seem to give the impression that there may be cycles in the forecast made up of alternating periods of over-forecasting and under-forecasting. But these are not so much due to a bias in the forecast as they are due to unexpected periods of recession or economic growth. Once one of these unexpected periods occur, it will affect the accuracy of the previous five 5-year forecasts for 5 years, and the accuracy of the previous ten 10-year forecasts for ten years.

Compensation for these periods of over and under-forecasting cannot be applied until after the events occur and only then can be identified and quantified. The forecast assumes average expected economic conditions. When that does not occur, the forecast will be high or low.

The weather adjusted Gross Firm Energy is shown in two separate columns in the Energy Accuracy table and they vary in each year due to the difference in weather normals used in each of the respected forecasts. Those weather normals differences are due to the use of a 25 year rolling average which relies on the previous 25 years of weather data at the time the forecast is created.

LOAD SENSITIVITES AND EXTREME EVENTS

Manitoba Hydro examines the effect of possible events on the load. The information presented here provides planners with an understanding of what the potential scale of these individual events may have on the system load requirements.

The individual effects of each event can be included in scenario or sensitivity analysis if the need arises. Each change in assumption can be individually applied to the forecast as required to capture the annual energy and peak effect of the desired assumption in any given year. All values are listed at Generation and include transmission and distribution losses.

A change of 1% in annual growth rate over 20 years would be equivalent to a 20% change in any individual event. Effects are summarized below, and the details of each effect follow.

Sensitivity of the Load to a Change In Assumptions	**Annual Energy Effect (GW.h)**	**Peak Effect (MW)**
1% Increase/Decrease in Population	± 130	± 24
1% Increase/Decrease in Income and GDP	± 125	± 23
1% Increase/Decrease in Electricity Price	∓ 62	∓ 11
1% Increase/Decrease in Gas to Electricity Price Ratio	± 0.5	± 0.1
Climate Change per Degree Celsius Warmer	+ 23	- 47

Certain events may have a significant effect on the load and are provided for scenario analysis.

Evaluation of Extreme Events	**Annual Energy Effect (GW.h)**	**Peak Effect (MW)**
If 0% or 100% of Residential had Electric Space Heat	-2,733, +4,796	-891, +1,564
If 0% or 100% Residential had Electric Water Heat	-892, +928	-102, +106
Increase/Decrease of One Very Large Industrial Customer	± 1,500	± 180
Maximum Potential Effect of Increased Online Shopping	- 846	- 156
Additional Load if 100% Electric Vehicle Saturation Rate	+ 4,172	+ 289
Illustrated Effect of Grid Parity (e.g. Solar Panels)	- 1,824	-104

For context, one year of energy growth is 425 GW.h and one year of peak growth is 70 MW.

Population / Economic / Price Changes

The population, economy and prices are the most significant drivers of the load in Manitoba. These variables are inputs to the econometric models utilized in this forecast. The individual effect of each driver based on the coefficients found in the models is summarized below.

Population: A 1% increase in population (12,686 people) results in a 1% increase in the number of Residential Basic customers (4,653 customers representing 74 GW.h) and a 0.60% change in the number of GS Mass Market Small and Medium customers (397 customers representing 41 GW.h). The total effect on Manitoba Gross Firm Energy would be 130 GW.h (0.53%).

Income / GDP: A 1% increase in real income results in a 0.27% increase in Residential average use (43 kW.h per customer and 20 GW.h overall). A 1% increase in Manitoba GDP results in a 0.55% increase in GS Mass Market Small and Medium average use (563 kW.h per customer totaling 37 GW.h). A 1% increase in Canada/US GDP results in 0.29% increase in GS Large Customer average use (15,934 kW.h per customer totaling 5 GW.h) and a 0.86% change in Top Consumers use (47 GW.h). The total effect of a 1% increase in Income and GDP together on Manitoba Gross Firm Energy is 125 GW.h (0.51%).

Electricity Price: A 1% increase in real electricity price results in a 0.26% decrease in Residential average use (-41 kW.h per customer totaling -19 GW.h). It will also result in a 0.12% decrease in GS Mass Market Small and Medium average use (-120 kW.h per customer totaling -8 GW.h; a 0.26% decrease in GS Mass Market Large average use (-14,213 kW.h per customer totaling -5 GW.h) and a 0.43% decrease in GS Top Consumers use (-23 GW.h). The total effect on Manitoba Gross Firm Energy is -62 GW.h (-0.25%).

Gas to Electricity Price Ratio: The gas to electricity price ratio is only modeled to affect new Residential construction therefore its effect is relatively small. A 1% increase in the ratio will result in 26 new electrically heated dwellings, with a total effect of about 0.5 GW.h.

	Energy (GW.h)	**Peak (MW)**
1% Increase/Decrease in Population	± 130	± 24
1% Increase/Decrease in Income and GDP	± 125	± 23
1% Increase/Decrease in Electricity Price	∓ 62	∓ 11
1% Increase/Decrease in Gas to Electricity Price Ratio	± 0.5	± 0.1

Climate Change

The Intergovernmental Panel on Climate Change projects an increase in global temperature as a result of rising concentrations of greenhouse gases in the atmosphere. Changes to temperature and extreme events have the potential to influence future energy demands.

In the last 100 years, the city of Winnipeg's 25-year average temperature has resulted in Degree Days Heating (DDH) in the range of 4,500 to 5,000 each year. A 25 year moving average is used for the forecast to help minimize the effects of year to year variability and to represent the long term climatology. This section quantifies the general effect caused by a 1°C increase in average daily temperature throughout the year.

In Manitoba Hydro's case, if Winnipeg experienced a uniform 1°C warming throughout the year, winter months would be subject to less heating while summer months would be subject to more cooling. Over 200 winter days, every degree Celsius of temperature rise above average conditions will result in an approximate decrease of 200 Degree Days Heating (DDH) per year, and a corresponding approximate increase of 100 Degree Days Cooling (DDC) per year over 100 summer days.

Applying the Weather effect for Manitoba Hydro at Generation gives:

Decrease of 200 DDH ➔ -225 GW.h and -47 MW in the winter

Increase of 100 DDC ➔ +248 GW.h and +103 MW in the summer

The resulting total effect of every one degree increase in temperature would be:

An increase of 23 GW.h to annual energy and a decrease of 47 MW to system peak.

	Energy (GW.h)	**Peak (MW)**
Climate Change per Degree Celsius Warmer	+23	-47

Change in Residential Use of Electricity for Space heat

Currently, 36.3% or 165,576 out of 456,130 Residential Basic customers heat their home with electricity. An increase of 1% in the percentage of customers with electric space heat would result in a change of 4,561 customers with electric space heat at 25,050 kW.h per customer, and a change of -4,561 customers without electric space at 10,572 kW.h per customer. The total Residential Basic increase would be 66 GW.h and 75 GW.h for Manitoba Gross Firm Energy. At a 35% load factor, this would be an increase of 25 MW at Peak.

If all Residential customers had electric space heat, then the additional load would be 4,796 GW.h. If no residential customers had electric space heat, then the reduction in load would be 2,733 GW.h

	Energy (GW.h)	Peak (MW)
If 0% or 100% of Residential had Electric Space Heat	-2,733, +4,796	-891, +1,564

Change in Residential Use of Electricity for Water heat

Currently, 49.0% or 223,500 out of 456,130 Residential Basic customers have electric water heat. An increase of 1% in the percentage of customers with electric water heat would result in a change of 4,561 customers with electric water heat using 3,500 kW.h per customer. The total Residential Basic increase would be 16 GW.h and 18 GW.h for Manitoba Gross Firm Energy. At a 100% load factor, this would be an increase of 2 MW at Peak.

If all Residential customers had electric water heat, then the additional load would be 928 GW.h. If no residential customers had electric space heat, then the reduction in load would be 892 GW.h

	Energy (GW.h)	Peak (MW)
If 0% or 100% Residential had Electric Water Heat	-892, +928	-102, +106

Potential Changes in Load from Very Large Industrial Customers

This forecast includes an expectation that there may be new large industrial users of electricity that may come to Manitoba. GS Top Consumers includes a Potential Large Industrial Loads category that adds 1,541 GW.h to GS Top Consumers by 2033/34. This is expected to be made up of increases and decreases by current top consumers, additions of new top consumers and company closures. However, this forecast does not anticipate the scenario of a single customer using up the entire PLIL projection.

Manitoba Hydro's largest customer currently uses in excess of 1,500 GW.h annually and has a coincident peak load of about 180 MW. It is feasible that one or more customers of this size could decide to start up in Manitoba in the next 20 years. A single large new customer could use the entire amount of energy that has been forecast under the Potential Large Industrial Loads projection.

Similarly, it is possible that one or more very large customers may discontinue operations in Manitoba. This could also be the equivalent of losing Manitoba Hydro's largest customer.

	Energy (GW.h)	Peak (MW)
Increase/Decrease of One Very Large Industrial Customer	± 1,500	± 180

Maximum Potential Load Effect of Increased Online Shopping

Online shopping is a growing service offering by many retailers. It is possible that this trend could lead to fewer retail establishments if online shopping becomes pervasive. The potential load reduction of such a scenario will be the electricity use of about 6,300 General Service customers in the Retail sector who currently use about 742 GW.h. At generation, this represents a potential total of 846 GW.h and 156 MW (using a 62% load factor). This assumes that the structures used for retail are torn down or are refurbished with other businesses that would otherwise have built a new structure.

	Energy (GW.h)	Peak (MW)
Maximum Potential Load Effect of Increased Online Shopping	-846	-156

Potential Load from High Adoption of Electric Vehicle Technology

This forecast includes the expected impact due to adoption of electric vehicles within Manitoba over the next twenty years. The specifics have been detailed in the Electric Vehicle Forecast section of this document.

It is possible that the current technological challenges will be solved, price will match those of internal combustion vehicles, and range anxiety will be alleviated. Should breakthroughs and advances in battery technology, changes in consumer perceptions, and price reductions happen in the next few years, it is possible that electric vehicles may grow to be the dominant vehicle.

The maximum load possible if 100% of all new passenger and commercial vehicles purchased every year are Plug-In Electric Vehicles (PEVs), then these vehicles would require 4,764 GW.h and 592 MW. Currently, the forecast for 2033/34 is 91 GW.h and 11 MW for PEVs, therefore the maximum additional load possible for 100% saturation would be an increase of 4,172 GW.h (10 years of load growth) and 581 MW (about 8 years of peak growth).

	Energy (GW.h)	Peak (MW)
Additional Load if 100% Electric Vehicle Saturation Rate	+4,172	+289

Illustrated Effect of Grid Parity

Grid Parity is when a customer will have an economic option to provide some or all of the electricity needs their home or business requires with an alternative energy source. Grid parity requires the self-generated kW.h cost to be competitive with utility power when considering operating, maintenance costs and a reasonable amortization period for capital costs.

Solar photovoltaic installations are frequently referenced in discussions related to grid parity as costs continue to decline. Initial adoption rates may be gradual and may take years to mature. For illustrative purposes, the effect at utility generation if 400,000 customers added solar panels each providing 4,000 kW.h per year with a 200% coincident load factor would be:

	Energy (GW.h)	Peak (MW)
Illustrated Effect of Grid Parity (e.g. Solar Panels)	-1,824	-104

ASSUMPTIONS

Economic Assumptions

Economic forecast assumptions are taken from the 2014 Economic Outlook and the 2014 Energy Price Outlook. These documents contain Manitoba Hydro's forecasts of economic variables including prices of electricity, natural gas and oil, Manitoba disposable income, Gross Domestic Product (GDP), Manitoba population and residential customers.

The following are the economic variables used in the preparation of this Electric Load Forecast:

Residential Customers - The number of Residential Basic customers in Manitoba is forecast to increase by 1.3% (5,802 units) in 2014/15 and averages 1.0% per year over the forecast period. This compares to a historical average increase of 1.0% per year over the last ten years. This is used in the Residential and GS Mass Market customer forecasts.

Electricity Prices - The electricity price forecast is based on CPI and rate increase projections used in the Integrated Financial Forecast. The real electricity price is forecast to increase by 2.2% in 2014/15, increase between 1.9% and 2.1% from 2015/16 to 2018/19 and then increase by 1.9% per year throughout the rest of the forecast period.

Natural Gas Prices – Manitoba Hydro views the natural gas price forecast as commercially sensitive information. Consistent with the Clean Environment Commission and Electric General Rate Application, this information will not be publicly disclosed. This is used in the Residential Basic forecast.

Manitoba Disposable Income - Real Manitoba disposable income annual growth was 1.2% for the past 10 years and 0.8% for the past 20 years. It is forecast to grow at 1.0% annually for the next 10 years and 1.2% annually for the next 20 years. This is used in the Residential forecast.

Gross Domestic Product (GDP) - Real economic growth in Manitoba is forecast to be 2.2% in 2014/15. It is expected to grow to 2.7% by 2016/17 and then drop to 1.6% by 2020/21 and then stay at that level for the remainder of the forecast period. This is used in the GS Mass Market and GS Top Consumer forecasts.

Normal Weather Assumptions

Weather for forecast purposes is measured by degree days. Winnipeg temperatures are used, as Winnipeg is central to most of the weather-dependent load (Residential and General Service Mass Market) in Manitoba.

Cold weather is expressed in Degree Days Heating (DDH), which is the number of average degrees colder than 14 degrees Celsius each day. Hot weather is expressed in Degree Days Cooling (DDC), which is the number of average degrees warmer than 18 degrees Celsius each day. Daily temperature is the average of the high and low temperature for the day. The equations are:

DDH = sum (max(0, 14 - (Daily high + Daily low) / 2))

DDC = sum (max(0, (Daily high + Daily low) / 2) - 18)

The base temperature of 14 degrees for DDH is the temperature below which most buildings have their heating systems (furnaces) running.

The base temperature of 18 degrees for DDC is the temperature above which buildings start to run their space cooling systems (air-conditioning).

The forecast is prepared assuming normal weather. Normal weather is determined from the 25 year average of Degree Days Heating and Degree Days Cooling in Winnipeg over the period April 1989 to March 2014.

The 25 year weather normals used for every year of this forecast are 4,569.8 DDH and 182.9 DDC. This is an increase of 28.5 DDH from last year’s normal of 4,541.3 DDH, and a decrease of 7.2 DDC from last year’s normal of 190.1 DDC.

The range of DDH from 1989 to 2014 was from a warm winter of 3,677.6 DDH in 2011/12 (892.2 DDH below normal) to a cold winter of 5,439.3 DDH in 1995/96 (869.5 DDH above normal).

The range of DDC from 1989 to 2014 was from a cool summer of 71.8 DDC in 2004/05 (111.1 DDC below normal) to a hot summer of 270.3 DDC in 1989/90 (87.4 DDC above normal).

Demand Side Management (DSM) in the Forecast

This forecast reflects future DSM savings associated with existing Provincial building codes and improved equipment efficiency standards (Codes and Standards). This is the only DSM initiative that is specifically accounted for in the forecast.

Savings due to DSM programs to date are embedded in the historical data that is the basis for this forecast. The current level of past achieved DSM savings is assumed to remain in place throughout the future. Future DSM savings arising from future Power Smart offerings and market engagement above the current level and incremental to the above mentioned Codes and Standards are treated as a supply-side resource and are not reflected in this forecast. They are accounted for separately in Manitoba Hydro's Power Smart.

As a result, historical growth rate in this document are not directly comparable to future growth rates because the history includes the effect of past DSM initiatives, but the forecast does not.

For customers involved in DSM initiatives such as the Load Displacement and Alternative Energy, the forecast excludes the effect of the initiatives, and project the load without the savings due to the initiatives.

Price / Income / GDP Elasticity

The economic effects of price, income and GDP have been incorporated into the 2014 forecast. The elasticity of each has been estimated from econometric modeling. See the Methodology section for more details. A summary of the elasticities found is:

	Price Elasticity	Real Income Elasticity	Real GDP Elasticity
Residential Basic	-0.26	0.27	
GS Mass Mkt Small/Medium	-0.12		0.55
GS Mass Mkt Large	-0.26		0.29
GS Top Consumers	-0.43		0.86
Gross Firm Energy	-0.25	0.51 (Income + GDP combined)	

METHODOLOGY

Residential Basic Methodology

The Residential Basic forecast was derived from population forecasts contained in Manitoba Hydro's 2014 Economic Outlook produced by the Economic Analysis Department, combined with an average use forecast developed from an econometric model. These results were then embedded into a residential end use model. The following components make up the end use model:

1. **Forecast Residential Dwellings** - The forecast of the total number of Residential Basic customers for the 2014/15 to 2033/34 period was taken from the 2014 Economic Outlook. The customer forecast is based on the average of several Manitoba population forecasts from various external agencies multiplied by a forecast of the people per customer ratio. The customer forecast is reduced by about 0.5% to account for customers with multiple services to obtain the forecast of individual dwellings.

2. **Determine Historical and Forecast Dwelling Breakdowns** – Historical data was taken back to 2009, the year of the last Residential Energy Use Survey. Billing data between 2009/10 and 2013/14 was used to update the survey data. The number of historical dwellings each year since 2009/10 was broken down by dwelling type (Single-Family Detached, Multi-Family Attached, and Individually-Metered Apartment suites) within each fuel region (Winnipeg, Gas Available outside Winnipeg and No Gas Available). Demolitions were estimated and the historical percentage of the number of new dwellings out of the total was applied to each regional dwelling forecast.

3. **Historical Space Heating Systems –** The number of historical dwellings by type and region were each divided into nine space heating systems: Electric Forced Air Furnace, Electric Baseboard, Electric Ground Source Heatpump, Electric Boiler, Gas High-Efficiency Furnace, Gas Mid-Efficiency Furnace, Gas Standard-Efficiency Furnace, Gas Boiler, and Other heat that is not billed for gas or electric. Starting percentages for 2009/10 were taken from the 2009 Residential Survey.

4. **Forecast of Space Heating Systems in New Dwellings** – Econometric equations were developed to forecast the number of electric space heating systems in new single detached and multi attached dwellings in Winnipeg and South Gas regions as follows:

Logit (Percentage of New Dwellings (t))

= -7.27 + 5.09 * PGEFF (lag(t))	Single Detached, Winnipeg
= -2.10 + 3.01 * PGEFF (lag(t))	Single Detached, South Gas
= -8.31 + 9.67 * PGEFF (lag(t))	Multi Attached, Winnipeg
= -2.42 + 4.91 * PGEFF (lag(t))	Multi Attached, South Gas

Logit	- A log transformation of percentages used for saturation analysis
PGEFF	- Ratio of the gas to electricity price for high efficiency furnaces
lag(t)	- The weighted average (30%, 40%, 30%) of the 3, 4 and 5 year lags

R-squared: 35.7%, 72.4%, 28.8%, 49.1%

T-stats:

Constant: -7.06, -7.53, -3.63, -3.22

PGEFF: 3.49, 7.59, 2.98, 4.61

5. **Forecast of Space Heating Systems in Existing Dwellings** – The average age of heating systems in existing dwellings was determined from the 2009 Residential Energy Use Survey. The number of replacements was estimated using a Weibull distribution based on average age of furnaces. Switches of furnace types were estimated using survey respondents in older dwellings with newer heating systems. Their former heating system was determined from billing system notes and inventory.

6. **Forecast of Water Heating Systems in New and Existing Dwellings –** Electric and natural gas water heater saturations and average age were estimated for dwellings with and without natural gas space heat using information from the 2009 Residential Energy Use Survey. The number of replacements was forecast using a Weibull distribution based on the average age of water heaters and switches between fuels were taken into account when forecasting future numbers of water heaters.

7. **Other End Uses** – Other major uses of residential electricity were forecast by dwelling type, including central air conditioning, major appliances, televisions and lighting using the saturation data from the 2009 Residential Energy Use Survey.

8. **Space Heating, Water Heating and Appliance Usage** – Conditional Demand Analysis using the 2009 Residential Survey data combined with 2009/10 customer annual use from billing data was used to derive the average annual energy use for different types of heating systems and appliances for existing and for newer dwellings. These average uses were multiplied by the number of each type of system and appliance to get the forecast of total energy use.

9. **Determine Overall Average Use** – An econometric model was used to forecast the average annual electricity use per customer of the Residential Basic sector. The Average Use per customer without Demand Side Management (DSM) programs and Codes & Standards (C&S) savings was used as the dependant variable in the econometric log model. Historical yearend data from 1989/90 to 2013/14 was modeled. The resulting model and parameters are :

   Log ((Total Use + DSM Programs + C&S) / customers)
   =6.529 + 1.596 x Ratio - 0.256 x Log Elec Price + 0.270 x LIncomeE + 0.005 x Trend

Ratio	- Electric Heat Customer Count / Total Res Basic Customer Count
Log Elec Price	- Natural Log of Manitoba Real Residential Electricity Price lagged 2.5 yrs
LIncome	- Natural Log of Manitoba Real Income per Residential Basic Customer

   R-squared: 99.4%
   T-stats:

Constant:	6.89
Ratio:	3.33
Log Elec Price:	-3.45
LIncomeE:	2.99
Trend:	5.26

10. **Determine Total GW.h used**

    The forecast number of dwellings multiplied by the overall average use determined the GW.h forecast. Annual savings estimates from the Heating Fuel Choice Initiative were subtracted, forecast Codes and Standards energy savings as outlined in the 2014-2017 Power Smart Plan 15 year Supplementary Analysis Report were subtracted, and future use of Electric Vehicles in the Residential sector was added. The result was the forecast of Residential Basic customer total energy use. This excludes savings from future Demand Side Management programs.

General Service Mass Market Methodology

A) General Service Mass Market Customer Forecast

Econometric analysis of historical sales data is used to develop models to forecast the number of General Service Mass Market customers. Forecasts of Manitoba GDP and Manitoba Hydro Residential Customers from the 2014 Economic Outlook are then input into the models, which generate forecasts for the number of customers for each year of the forecast period.

The number of customers at fiscal yearend was forecast using the following calculations for each year (t):

Number of Customers (t)
= Number of Customers (t-1)
+ Change in the Number of Customers (t)

Change in the Number of Customers (t)
= Number of Customers (t-1)
x Percentage Change in Number of Customers (t)

The percentage change in number of Small Non-Demand, Small Demand and Medium customers was modeled using yearend historical customer data from 1984/85 to 2013/14. The resulting model and parameters are as follows:

Percentage Change in Number of Customers (t)
= -0.002 + 0.129 x LCGDP + 0.601 x CRES

LCGDP	- Annual Lagged Percentage Change in Manitoba Gross Domestic Product
CRES	- Annual Percentage Change in Residential Basic Customers

R-squared: 60.6%

T-stats:

Constant:	-1.45
CGDP:	4.08
CRES:	4.19

The number of General Service Large customers was modeled using yearend historical customer data from 1989/90 to 2013/14. The resulting model and parameters are as follows:

Number of GS Large Customers (t)

= 11.694 + 0.005 x GDP

R-squared: 97.7%

T-stats:

Constant:	1.53
GDP:	31.56

B) General Service Mass Market Average Use Forecast

Historical Average Use was calculated by removing the effects of DSM and Codes & Standards. Average use for Small Non-Demand, Small Demand and Medium classes are forecast using econometric log model with Electricity Price and Manitoba GDP included in the regression.

Average Use of Small Non-Demand, Small-Demand and Medium classes were modeled using historical data from 1989/90 to 2013/14. The resulting model and parameters are as follows:

Log Average Use

=5.835 - 0.118 x Log Elec Price + 0.554 x LGDP – 0.033 x Dummy

Log Elec Price	- Natural Log of Manitoba Real GSMM Electricity Price
LGDP	- Natural Log of Manitoba Real Gross Domestic Product
Dummy	- "1" after year 2006/07, due to a billing system change causing a reclassification of customers in 2006/07.

R-squared: 98.5%

T-stats:

Constant:	10.81
Log Elec Price:	-2.03
LGDP:	13.06
Dummy:	-3.18

The Average Use for Large Mass Market customers was modeled using historical data from 1989/90 to 2013/14. The resulting model and parameters are as follows:

Log Average Use
=13.528 - 0.256 x Log Elec Price + 0.287 x LGDP

Log Elec Price - Natural Log of Manitoba Real GSMM Electricity Price
LGDP - Natural Log of Cross Real Gross Domestic Product (equally weighted on Canadian and US GDP)

R-squared: 94.2%
T-stats:

Constant:	23.23
Log Elec Price:	-2.30
LGDP:	6.47

Top Consumer customers are excluded from these classes for forecasting purposes.

Customers are assigned to a rate class depending on their usage. If usage by an individual customer increases (or decreases) sufficiently then they will be re-assigned to the appropriate rate class. These shifts tend to offset each other over time so individual classes have not shown significant upward or downward trends in average use. By definition, the truncation of these classes results in relatively stable average use for each class.

C) General Service Mass Market Total Use Forecast

General Service Mass Market customer growth is assigned to Small Non Demand, Small Demand and Medium classes by using their 5 year average use by class and allocating the customers appropriately.

Total GW.h for the General Service Mass Market sector is forecast by multiplying the forecast number of customers in each rate class by the forecast average use. Codes and Standards energy savings from the 2014-2017 Power Smart Plan 15 Year Supplementary Analysis Report were subtracted, and future use of Electric Vehicles in the Mass Market sector was added.

General Service Top Consumers Methodology

Each company in the Top Consumers group is forecast individually. Information on individual company operating plans is collected from industry news, Manitoba Hydro's economic experts and Manitoba Hydro's Key & Major Account advisors. This information is used to prepare company specific short term forecasts for committed projects that are known for the next 3 to 5 years. The company's individual forecast is then held constant for the years following.

To account for longer term energy requirements in this group of consumers, a special classification called Potential Large Industrial Loads (PLIL) has been created. PLIL is used instead of attempting to forecast each top consumer individually for the long term. It represents the natural growth or contraction of all the top consumers as a group, as well as unexpected major expansions, new customers, or loss of customers.

To forecast PLIL, an econometric model was used. Historical effects of Demand Side Management (DSM) energy savings were removed from the Top Consumer load. An econometric log model was developed by applying Top Consumer Electricity Price and equally weighted Canadian and US Real GDP.

Total Load of Top Consumers was modeled using historical data from 1983/84 to 2013/14. The resulting model and parameters are as follows:

Log Total Load

=1.477 – 0.426 x Log Top Price + 0.862 x LGDP

Log Top Price - Natural Log of Manitoba Real Top Consumers Electricity Price

LGDP - Natural Log of Cross Real Gross Domestic Product (equally weighted on Canadian and US GDP)

R-squared: 97.6%

T-stats:

Constant:	2.27
Log Top Price:	-2.95
LGDP:	15.98

Electric Vehicles

The methodology for forecasting Electric Vehicles used historical data on automobile registrations per year in Manitoba to help estimate future trends. Appropriate assumptions from recent relevant literature were applied to Manitoba's situation. The forecast section on Electric Vehicles provides further details.

Other Sectors

Seasonal, Water Heating, Lighting

Most of the smaller sales sectors, including Seasonal, Flat Rate Water Heating and Area and Roadway Lighting were done by analysis of changes in the number of customers or services and in changes in average use per customer or service. Growth rates were applied based on history and a best estimate as to what the future will bring.

Diesel

Each of the diesel generated supplied communities was individually forecast and included in the forecast under the assumption that these communities are not anticipated to be connected to the Integrated System during the forecast period.

Monthly Sales Allocations

Monthly percentages of customer growth through the year and GW.h for the month of the year were averaged for the past five years. These were applied to the forecast annual customers and kW.h to get the monthly forecast.

Monthly and Annual Gross Firm Energy and Gross Total Peak

The 5 year monthly percentage of Common Bus and Station Service are applied to their annual energy to calculate their monthly values. Transmission Losses are calculated using a 5 year average of their ratio to Common Bus. Monthly Common Bus, Transmission Losses and Station Service are added up to give the Monthly System Energy. Monthly Common Bus, Transmission Losses, Station Service and Gross Firm Energy are totaled to give the Annual Gross Firm Energy.

The Gross Total Peak is calculated from Load Factors applied to the forecast monthly Gross Total Energy. Prior to calculating the Load Factors, the Top Consumer energy and peak are subtracted because the Top Consumers have a higher average hourly energy relative to their peak value than the Residential and General Service Mass Market Customers. A 10 year historical average Load Factor is calculated for the remaining energy and is applied to the forecast monthly energy to get the peaks for the remaining energy. The Top Consumer peaks are added using an 95% Load Factor applied to the Top Consumer monthly energy.

The annual Gross Total Peak is calculated using the 3 month winter Load Factor for the winter months of December, January and February applied to the energy for the same three months.

Historical weather adjusted energy is used to calculate the annual Load Factor. The historical trend of the load factor increasing 0.1% per year is applied to the forecast. The number of hours in the month is used to calculate monthly Load Factors and the number of hours in the three winter months is used to calculate annual Load Factors.

Growth Rates

Annual GW.h/year growth rates in this document are linear growth rates, calculated as:

GW.h growth / number of years.

Annual percentage growth rates in this document are compound growth rates calculated as:

(final GW.h / initial GW.h) ^ (1 / number of years) – 1.

GLOSSARY OF TERMS

Area and Roadway Lighting sector - includes electricity sales for the Sentinel Lighting and Street Lighting rate groups.

Common Bus - is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers, Construction Power plus associated Distribution Losses, but excludes Diesel customers, Transmission Losses and Station Service.

Customer – Most metered electrical services count as a customer. Unmetered services such as flat rate water heating and sentinel rental services do not count as a customer. Street lighting counts all the services grouped as a premise as one customer.

Codes and Standards – A Demand Side Management (DSM) initiative associated with existing Provincial building codes and improved equipment efficiency standards. This is the only DSM initiative that is specifically accounted for in the forecast.

Curtailable - is a load that can be curtailed on short notice. A discount is given for subscribing to this program. Curtailable loads can affect peak demand because some periods of curtailment may be at or near the system peak.

Degree Days Cooling (DDC) - DDC is a measurement designed to reflect the demand for energy needed to cool a building. DDC is the number of degrees warmer than 18 degrees Celsius each day is, based on the average of the high and low temperature of the day.

DDC = sum (max(0, (Daily high + Daily low) / 2) - 18)

Degree Days Heating (DDH) – DDH is a measurement designed to reflect the demand for energy needed to heat a building. DDH is the number of degrees colder than 14 degrees Celsius each day is, based on the average of the high and low temperature of the day.

DDH = sum (max(0, 14 - (Daily high + Daily low) / 2))

Gas Available Area – A city or town in Manitoba where customers have natural gas service available and can choose to heat their dwelling with either natural gas or electricity.

Approximately 82% of Residential Basic customers, including the entire city of Winnipeg, have gas available.

General Consumers Sales - includes the energy supplied to all of Manitoba Hydro's individually billed customers. It excludes export sales.

General Service Mass Market - includes all Commercial and Industrial customers, excluding the Top Consumers group.

General Service Sector - made up of sales to Commercial and Industrial businesses served by Manitoba Hydro. This sector consists of five rate groups (Basic, Diesel, Seasonal, Flat Rate Water Heating and Surplus Energy Program).

General Service Top Consumers - is made up of the largest electricity users of Manitoba Hydro.

Gross Firm Energy - is the energy required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports, interruptible (non-firm) loads and diesel customers.

Gross Total Peak - is the maximum integrated (i.e. average) hourly load required to serve Manitoba Hydro's customers on the Integrated System. It excludes exports and diesel customers. It includes curtailable loads.

GW.h (gigawatt-hour): The unit of energy primarily used in this document. One GW.h equals one million kW.h (kilowatt-hours), which is approximately equal to the energy of 100 typical dwellings not using electricity for heating, or 40 dwellings that use electricity for heating.

Integrated System - is the power grid that connects Manitoba Hydro's generation sources to its customers. All Manitoba Hydro's customers except diesel are on the Integrated System.

Interruptible (Non-Firm) Energy - includes all energy sold to Manitoba customers on a non-firm basis. Currently, the only rate group for this is the Surplus Energy Program (SEP).

kW.h/cust (kilowatt-hours per customer): The unit of energy primarily used in this document to represent the average use of one customer. The total usage in GW.h of a group of customers is divided by the number of customers and then multiplied by one million.

Load Factor - is the ratio of the average hourly energy over a period, usually a year, divided by the energy used at a specific hour, usually the hour of system peak. A load factor of 25% means that the average energy is one-quarter of what is used at system peak. A load factor greater than 100% means that the average hourly energy is more than what is used at system peak. Given a specific energy, a lower load factor means a higher peak. The equation is:

Load Factor = (Total Energy / Hours) / (Energy over the hour of system peak)

Manitoba Load at Common Bus - is the total load measured from all the distribution points (i.e. substations) within Manitoba. It includes all energy supplied to General Consumers Sales customers plus associated Distribution Losses, but excludes diesel customers, Transmission Losses and Station Service.

MW (megawatt): The unit of peak demand primarily used in this document. One MW is a million watts. One thousand MW of peak demand for one hour equals one GW.h of energy. Alternatively, one MW for a thousand hours also equals one GW.h of energy.

Net Firm Energy and **Net Total Peak** - are the same as Gross Firm Energy and Gross Total Peak except they exclude Station Service. The reporting of Manitoba Load in the Load Forecast used “Net” until 2008. It presented both until 2011. Starting with the 2012 forecast, only the “Gross” is presented. Net can be calculated when needed by subtracting Station Service from the Gross.

Residential Basic – is the primary residential customer group made up of single detached and multi-family dwellings as well as individually metered apartment suites.

Residential sector - made up of sales to residential customers for non-business operations. The Residential sector is comprised of four rate groups (Basic, Diesel, Seasonal, and Flat Rate Water Heating).

Station Service - is the energy used by power plants to generate power and service their own load.

MANITOBA HYDRO
2015/16 & 2016/17 GENERAL RATE APPLICATION

DEMAND SIDE MANAGEMENT

8.0 OVERVIEW

Tab 8 provides an overview of Manitoba Hydro's Demand Side Management ("DSM") program. Section 8.1 discusses the role of DSM at Manitoba Hydro, Section 8.2 provides a summary of the current DSM plan, and Section 8.3 provides a summary of the progress of Power Smart Programs to date.

8.1 DSM'S ROLE IN FULFILLING MANITOBA HYDRO'S MANDATE

By taking an integrated approach, DSM activities play a key role in a number of the Corporation's core business activities, including:

1) Integrated Resource Planning;
2) Demand Side Management;
3) Customer Care/Service & Relationship Management; and
4) Corporate Branding/Image.

8.1.1 Integrated Resource Planning

Manitoba Hydro's mandate is to provide for the continuance of a supply of energy to meet the needs of Manitoba consumers in the most reliable, economic and environmentally sustainable manner. In fulfilling this mandate, Manitoba Hydro's mission includes promotion of economy and efficiency in the supply and end-use of energy, requiring consideration of all available options for the supply and delivery of energy to Manitobans. These options include both supply-side resources and demand-side resources with both playing a significant role in meeting the province's existing and future energy needs as outlined in Tab 9.

Through an investment of $576 million, DSM efforts to 2013/14 have achieved an estimated 768 MW and 2,481 GW.h in capacity and energy savings, and 88 million cubic metres in natural gas savings. In addition to achievements to date, Manitoba Hydro's DSM plan targets the achievement of 1,136 MW and 3,978 GWh of savings over the next 15 years, involves an investment of more than a billion dollars and will be relied upon to meet 66% of projected electricity load growth in Manitoba during this period. The electricity savings achieved through DSM is significant with the magnitude being in the same range as a number of large generating stations.

Manitoba Hydro updates its DSM plans on an annual basis to reflect new and updated information. With the passing of *The Energy Savings Act* in the spring of 2012, the process and framework for establishing DSM plans in Manitoba was changed. Key changes include:

- Manitoba Hydro is to develop the DSM plan in consultation with the Minister Responsible for Manitoba Hydro, which provides a framework for the Province to guide Manitoba Hydro's DSM targets and priorities;
- A requirement for the DSM plan to be updated annually by March 31st of each year.
- A requirement to have the results of the DSM plan reported annually by March 31st of each year.

The 2014 – 2017 Power Smart Plan was developed under this new framework.

Subject to concurrence with the Minister, Manitoba Hydro incorporates all economic opportunities in its DSM plan. The energy savings targeted in the plan are incorporated into the Corporation's long term resource plan. As such, DSM is included within Manitoba Hydro's integrated resource planning process and all economic DSM opportunities would be part of its overall plans to meet the province's future energy needs.

8.1.2 Demand Side Management

Manitoba Hydro's DSM initiative involves all activities to achieve the energy savings targeted within its DSM plan. Similar to building other long life resource options, the DSM Plan involves making a significant investment, taking a long term perspective and having broad and coordinated efforts over this period.

Manitoba Hydro's DSM Plan takes a comprehensive approach to support the efficient and productive use of energy including offering incentive based programs, education, research, support for codes and standards, rates initiatives, customer-sited self-generation for load displacement, and load management activities. In aggregate, these activities form part of an overall integrated and long term strategy to lower the demand for electricity and natural gas in Manitoba and assist customers in managing their consumption and associated energy bills. Manitoba Hydro's Power Smart strategy is to ultimately create a sustainable market change where energy efficient technologies and practices become the market standard.

Codes, standards and regulations are an important aspect of DSM programming at Manitoba Hydro, providing tools for customers to evaluate their energy performance, validating the measurement and verification of program savings, and supporting substantial energy savings through energy performance regulation today and into the future. Codes and standards implemented through energy performance regulations help cement the savings obtained from Power Smart programs designed to accelerate the transformation of markets to more energy efficient technologies, locking those savings in for future generations.

Both the Canadian Standards Association (CSA) and Natural Resources Canada (NRCAN) recognize Manitoba Hydro as a leading contributor towards the national development of codes and standards governing energy performance. Manitoba Hydro's DSM initiative actively contributes financial resources and critical technical expertise to support the work undertaken by the CSA and NRCAN to develop new codes and standards in support of their long term and comprehensive strategy to reduce energy consumption by a broad range of consumer goods, residential and commercial buildings and industrial processes.

Manitoba Hydro's strategy also engages external third parties to promote and deliver programs or components of programs through arrangements that extend from third party delivery contracts to registered suppliers. The Refrigerator Retirement, Water & Energy Savings, Commercial Kitchen – Pre Rinse Spray Valve, and Residential LED Lighting programs are a few examples of programs delivered through third party delivery contracts. Manitoba Hydro has also entered into partnership arrangements with organizations such as, but not limited to, North End Community Renewal Corporation, Brandon Neighbourhood Renewal Corporation, Building Urban Industries for Local Development (BUILD), Brandon Energy Efficiency Program (BEEP) and numerous First Nation Communities to promote and deliver energy efficiency upgrades to lower income households under the Affordable Energy Program. Manitoba Hydro is further working with AKI Energy, an aboriginal social enterprise, to promote and deliver the Community Geothermal Program in First Nation communities. To leverage industry, Manitoba Hydro has signed Power Smart agreements with 2,500 retailers and contractors actively promoting Manitoba Hydro's programs directly to customers. Industrial programs also actively leverage the capabilities of equipment suppliers and vendors to assist customers in identifying opportunities for increased energy efficiency and related productivity improvement.

8.1.3 Customer Care/Service & Relationship Management

Operationally, DSM and customer care activities are integrated to complement the Corporation's overall objective of serving its customers in a comprehensive, efficient and convenient manner. Offering DSM programs and energy services provides Manitoba Hydro with an excellent opportunity to assist customers with lowering their energy bills and concurrently the activities build positive relationships with customers, industry and stakeholders. Numerous DSM related opportunities occur on a daily basis with customers in all sectors and the depth of interactions are reflected in the participation rates under the many Power Smart programs. For example, Manitoba Hydro is working with 54 First Nation communities to implement energy efficient measures in their communities, approximately 10,000 lower income customers have participated in the Affordable Energy Program, over 850,000 customers have participated in residential programs, over 26,000 customers have participated in commercial programs and with over $300 million being provided in convenient on-bill financing.

The customer care/service & relationship management functional activities align with the Corporation's DSM activities and allow Manitoba Hydro to capture synergies to reduce overall operational costs and to provide customers with exceptional customer service through addressing customers' energy needs in a convenient approach.

8.1.4 Corporate Branding/Image

Manitoba Hydro has successfully delivered DSM initiatives for over 20 years under the "Power Smart" brand. The Power Smart brand and associated significant DSM activities have been leveraged by the Corporation to enhance its corporate image with the general public, communities, key stakeholders and all customer sectors. A significant majority of customers report that they are very satisfied with Manitoba Hydro's "Efforts to Encourage Customers to be More Energy Efficient" with 82% reporting a satisfaction level of 7 or higher on a satisfaction scale of 1 - 10.

8.2 CURRENT DSM PLAN

Manitoba Hydro has a strong commitment to DSM, focusing on pursuing all cost effective energy efficiency opportunities and continually monitoring the market for emerging trends and additional opportunities. Under Manitoba Hydro's current long range plan for DSM, "The 2014-17 Power Smart Plan – 15 Year Supplemental Report", (see Appendix 8.1), energy and demand savings resulting from Power Smart initiatives are targeted to achieve 3,978 GW.h and 1,136 MW by 2028/29. This activity represents 13% of the estimated electric load forecast offsetting 66% of projected load growth during this period. Combined with the energy savings to date, total electric savings of 6,286 GW.h and 1,635 MW will be realized by 2028/29.

Over the last year, Manitoba Hydro has introduced a number of new DSM initiatives and enhancements to existing initiatives to assist residential, commercial and industrial customers in managing their energy bills. More specifically, new programs launched include the Residential LED Lighting program, the LED Roadway Lighting Conversion Program and the Load Displacement Program. In addition, a number of enhancements to existing Power Smart programs were introduced, such as increased incentives, new measures, and enhanced sales and technical support. Some examples are as follows:

- increased insulation incentives and introduced free energy assessments for electrically heated homes;
- added direct installation of high efficiency pre-rinse spray valves to the Commercial Kitchen program;
- introduced higher performance levels beyond the new energy code for buildings, and increased incentives and technical assistance to support energy modeling under the Commercial New Buildings program;
- increased incentives under the Refrigerator Retirement, Commercial Lighting, Commercial Building Envelope, Commercial CO2 Sensors, and Commercial Refrigeration programs; and
- expanded financial and technical support for embedded energy managers in large commercial and industrial facilities under the Industrial Performance Optimization Program, accelerating the identification of efficiency improvements among Manitoba's largest energy users.

8.3 SUMMARY OF PROGRESS TO DATE

Manitoba Hydro's Power Smart Programs have been and continue to be very successful at reducing customers' energy bills while contributing to a sustainable energy supply for the needs of the Province of Manitoba as a whole. Appendix 8.2 provides the 2012/13 Power Smart Annual Review, highlighting Power Smart achievements including annual load reductions of 2,296 GW.h and 637 MW in winter peak demand reductions (at generation). These Power Smart electrical savings translate into a cumulative reduction of $660 million in customer electricity bills to date, and indirect greenhouse gas emission reductions of approximately 1,532,000 tonnes of carbon dioxide equivalent emissions in 2012/13 alone.

The energy savings realized during 2013/14 are presently being evaluated with the report expected to be finalized in the spring of 2015. The Corporation's DSM efforts are on target with estimated savings 768 MW and 2,481 GW.h as of March, 2014.

Manitoba Hydro's leadership role and continued commitment to DSM has been recognized by independent organizations including:

- In 2014, Manitoba Hydro won E Source's inaugural DSM Achievement Award for the Most Energy Savings per Customer for a gas utility. E Source benchmarked savings for portfolios from across North America and highlighted the best performing utilities in four categories.

- Manitoba Hydro's Power Smart financing programs were highlighted in a case study in the State and Local Energy Efficiency (SEE Action) Network "Financing Energy Improvements on Utility Bills: Market Updates and Key Program Design Considerations for Policymakers and Administrators" published May 22, 2014. This report, prepared by energy efficiency financing experts at the Lawrence Berkeley National Laboratory, examined best practices regarding structure and implementation of on-bill energy efficiency financing programs. Manitoba Hydro's inclusion in this report was highlighted as the company has achieved significant market penetration; having been adopted by 17 per cent of Manitoban households and representing $350 million in financing since program inception, this is the highest penetration of all 30 of the programs included in the report.

- Manitoba Hydro was asked to present their Affordable Energy Program (formally known as the Lower Income Energy Efficiency Program) at the Chartwell's Best Practices Summit on Serving Low-Income Customers in April 2009.

- The Canadian Energy Efficiency Alliance (CEEA), a leading non-government energy efficiency advocate, awarded Manitoba an "A+"; the highest rating awarded to any province of territory in its most recent (2009) National Report Card on Energy Efficiency. Manitoba Hydro was the key contributor to achieving this rating. This was the fourth consecutive report card covering eight years where Manitoba had either led or tied for first place in the national rating. CEEA no longer conducts these reviews.

- Manitoba Hydro's leadership and success in promoting energy efficiency in compressed air and other processes is well recognized by other utilities such as BC Hydro, Toronto Hydro and others from across North America who have contracted Manitoba Hydro to facilitate training for their industrial customers and local suppliers.

Figures 8.1 and 8.2 depict the energy and demand savings realized through to 2012/13.

Power Smart Plan

2014 to 2017

SUPPLEMENTAL REPORT:
15yr (2014 to 2029)

Manitoba Hydro
POWER SMART

EXECUTIVE SUMMARY

Manitoba Hydro's 2014-2017 Power Smart Plan - 15 year supplemental report outlines the Corporation's demand side management program over the next 15 years, with some programs formally approved and placeholders used for those programs requiring further review and analysis. The Plan was developed through an intensive planning process which builds on the Corporation's experience and continuous involvement in demand side management since 1989. This plan builds upon and is consistent with the 2014-2017 three year Power Smart Plan which was prepared in consultation with the Minister responsible for Manitoba Hydro. The 15 year plan is required to accommodate the Corporation's overall longer term business planning requirements, including developing an integrated resource plan.

This supplemental report outlines the 15 year forecast of energy and demand savings, investments and cost effectiveness metrics to the benchmark year of 2028/29 which will be achieved through electricity and natural gas Power Smart Programs. The plan sets out to realize electricity savings of 1,136 MW and 3,978 GW.h, natural gas savings of 108 million cubic meters and combined global greenhouse gas emission reductions of 2.9 million tonnes by 2028/29. This activity represents 12.7% of the estimated electric load forecast offsetting 66% of projected load growth during this period and 5.3% of the estimated natural gas volume forecast by 2028/29, further reducing natural gas consumption in Manitoba. The total cost of achieving the energy savings is $978 million; $818 million of the costs are funded through the Corporation's Power Smart electricity budget, $130 million from the Power Smart natural gas budget, $11 million from the Affordable Energy Fund and $19 million from the Furnace Replacement budget for targeting furnace replacement.

Combined with energy savings achieved to date, total electrical savings of 1,635 MW and 6,286 GW.h and total natural gas savings of 211 million cubic meters will be realized by 2028/29. These combined energy savings are expected to result in an overall reduction of greenhouse gas emissions of 4.6 million tonnes by 2028/29. This activity represents 20.1% of the estimated electric load forecast and 10.2% of the estimated natural gas volume forecast by 2028/29. It is expected that by 2028/29, a cumulative investment of achieving the energy savings will have been $1.6 billion dollars, $1.3 billion of the costs are funded through the Corporation's Power Smart electricity budget, $232 million from the Power Smart natural gas budget, $37 million from the Affordable Energy Fund, $27 million from the Furnace Replacement budget for targeting furnace replacement.

By reducing electricity and natural gas consumption through innovative products, participating customers can expect to save $191 million in 2028/29 and $1.7 billion cumulatively by 2028/29. When combined with bill reductions to date, Power Smart programs are expected to save participating customers $277 million in 2028/29 and over $4.3 billion dollars cumulatively by 2028/29.

The overall Societal Cost (SC) and Total Resource Cost (TRC) metrics for the electric and natural gas Power Smart portfolio is 2.2 and 2.0, respectively. The electric Power Smart portfolio has an overall TRC of 2.2, RIM of 1.0 and an overall levelized utility cost of 1.8 cents per kilowatt-hour. The natural gas Power Smart portfolio has an overall TRC of 1.1, RIM of 0.5 and an overall levelized utility cost of 18.6 cents per cubic meter. Excluding the Affordable Energy Program, the natural gas Power Smart portfolio has an overall levelized utility cost of 13.5 cents per cubic meter.

Program Categories
Economic Effectiveness Metrics
Other DSM Program Assumptions

1 THE 2014-2017 POWER SMART PLAN

1.1 Introduction

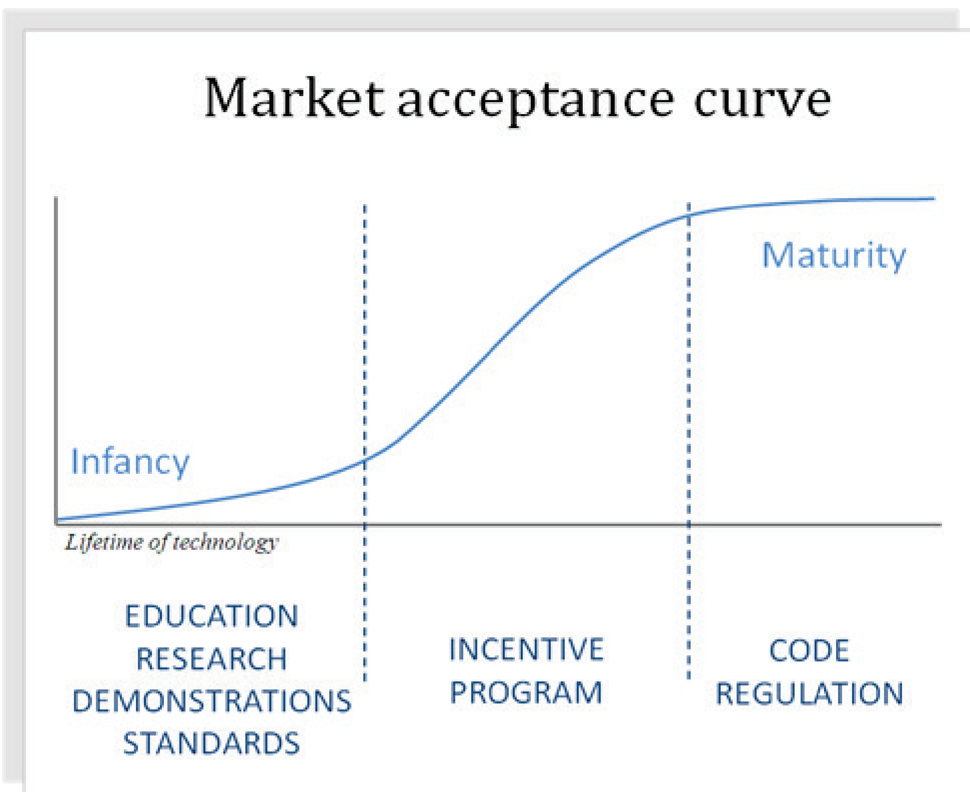
Manitoba Hydro's 2014-2017 Power Smart Plan – 15 year supplemental report outlines the Corporation's demand side management program over the next 15 years, with some programs formally approved and placeholders used for those programs requiring further review and analysis. The Plan was developed through an intensive planning process which builds on the Corporation's experience and continuous involvement in demand side management since 1989. This plan builds upon and is consistent with the 2014-2017 three year Power Smart Plan which was prepared in consultation with the Minister responsible for Manitoba in accordance with the Energy Savings Act. The 15 year plan is required to accommodate the Corporation's overall longer term business planning requirements, including developing an integrated resource plan.

Manitoba Hydro's DSM plan is an input to the development of the Corporation's Integrated Power Resource Plan. To support this process, the Corporation prepares a 15 year forecast which is reviewed and updated annually to reflect current market information and trends. This supplemental report outlines the 15 year forecast underpinning the approved 2014 – 2017 Power Smart Plan and includes the long term forecasts of energy and demand savings, budgets and cost effectiveness metrics.

1.2 DSM Market Transformation Strategy

Manitoba Hydro's DSM strategy is to aggressively pursue all cost effective energy efficiency opportunities and continually monitor the market to identify emerging trends and opportunities which may become viable and cost effective DSM initiatives within the planning horizon with the end goal of creating a sustainable market change where the energy efficient technology or practice ("EE measure") becomes the market standard.

To accomplish this in a manner that ensures permanent market transformation to the EE measure is achieved, a long term and comprehensive approach is used that involves different market intervention strategies at the various stages of the EE measure's adoption into the market. These strategies are researched and designed using a collaborative approach considering the input and expertise of the entire delivery channel for the EE measure including designers, suppliers, retailers and target customers.



Infancy

When an EE measure is first introduced to the market, it is typically received with skepticism on the part of installers, facility owners and consumers. The market is also often characterized by limited availability of the product, higher costs and, in many cases, unverified or untested energy performance claims. These conditions make it difficult to develop and increase market acceptance for the product. Lack of informed suppliers or experienced installers is also an issue with some EE measures, as many industry participants prefer to retain their own "tried and true" supply chain and installation methods.

It is of utmost importance in this phase that these barriers are addressed otherwise the EE measure will face difficulty with achieving market penetration and may fail to enter the growth stage.

Market Intervention Strategies:

Research and Development including possible demonstrations project showcasing the EE technology are important to demonstrate the performance claims for the measure and possibly to even highlight areas where the EE measure can be improved. For technologies related to space and water heating in particular, local field demonstration experience can be critical to increasing acceptance, due to Manitoba's climate differences from typical laboratory or field testing. Demonstrations also have additional benefits through the ability to become showcases for the purpose of education and a future basis for communications that incorporate "real world" experiences that installers and customers can identify with operational performance.

If the energy performance of the EE technology is already known or has been verified through research and demonstration, communication strategies focusing on education to the market are critical to building awareness of the EE measure and its benefits.

Policy relating to energy efficiency is a very powerful strategy for EE measures in the infancy stages as it encourages government stakeholders to be to become leaders with energy efficiency and be the early adopters of the new technology. Early adopters are critical to the successful launch of new EE measures as they help to build the base industry infrastructure by creating initial demand.

Growth

Once the barriers of the Infancy stage have been identified and a strategy to address the barriers has been successfully implemented for the EE measure, market penetration begins to rise, whether voluntarily or through a policy strategy. In the early stages of growth, there needs to be a balanced approach to creating demand for the measure while ensuring that the market has developed qualified and knowledgeable providers in order to meet the emerging demand. EE measures in early growth can face irreparable damage if the early majority adopters lose confidence in the measure due to performance that does not meet expectations.

At this stage, the product efficiency performance is established with energy benefits to the customer quantified and the non-energy benefits have been identified. However, there will still be a lack of knowledge in the market as to the optimum methods of realizing these benefits.

During later periods of the growth stage, installers and suppliers become more plentiful, there may be customers with years of successfully implementing the EE measure, and there is increased awareness of the existence of the product.

Through the majority of the growth phase, a first cost premium typically remains associated with the EE measure.

Power Smart can have a significant impact on the rate at which a product is adopted in the market regardless of the form of the program or support offered due to the immense trust that industry and consumers have in Manitoba Hydro's expertise in matters pertaining to energy efficiency.

Market Intervention Strategies:

The strategies that are employed during this phase are dependent upon the characteristics of the market the technology is directed toward, the magnitude and significance of the additional cost to the market, and the breadth of accommodation that must be made in order to effectively utilize the technology. Strategies can vary drastically not only by market segment but also by specific technology. A thorough understanding of the market, both overall characteristics and drivers and detractors to the EE measure, is essential to ensure that the program design is addressing the proper target market and contains the tools and strategies that will address the barriers present.

Marketing and communication strategies focus on comprehensive messaging that includes both the efficiency benefits and the non-energy benefits that have been attributed to the measure, and that have a perceived value to the intended target market, in order to maximize the market adoption.

With first cost still a barrier, many programs will utilize financial tools such as incentives and/or financing to encourage customer adoption of the measure. The specific tool used or the extent to which the program covers the incremental cost of the measure will vary by technology and by target market and, once again, involves consultation with the channel participants to determine the optimal contribution by Power Smart.

Equally as important to the more visible customer directed strategies are capacity building initiatives. These strategies can be especially important for those EE measures that rely on professional consultants or installers for implementation and include training, education, and certification of groups such as homebuilders, equipment installers, engineers, architects, retailers, and distributors.

In assessing options for pursing a Power Smart program to support an EE measure, Manitoba Hydro uses a number of metrics as guidelines to assess the opportunities. These metrics assist in determining whether to pursue an opportunity, how aggressive an opportunity will be pursued, the effectiveness of program design options and the relative investment sharing between ratepayers and participating customers.

Maturity

At the maturity phase of the EE measure's life cycle, the measure's use has become the preferred installation for the majority of the installers and customers in the market. At this stage volumes have increased to the point that prices are reduced to the same level as the technology that is being replaced, or the price of the technology is in alignment with the value perceived by the customer. With these conditions, program participants often are qualified as "free riders"; in other words, they would have adopted the measure even in the absence of a program so the incentive they received was not responsible for achieving their energy savings.

Market Intervention Strategies:

During this phase, Manitoba Hydro's strategy involves pursuing the remaining opportunities through the adoption of codes and regulations. A code or a regulation ensures permanent market transformation for the specific energy efficiency opportunity since a potential always exists that the market could revert back to the non-efficient option once Power Smart has reduced or eliminated its program support.

Manitoba Hydro is heavily engaged in both Federal level and Provincial level committees that work to establish ongoing updates to minimum energy performance standards for technologies and to determine the appropriateness of their adoption into a code or a regulation. The assessment of the most appropriate exit strategy for a technology is strategized as early as at the infancy phase of the adoption life cycle of the EE measure where possible.

1.3 Power Smart Programs

The following table provides program durations and cumulative participation for incentive based and financial loan programs over the 15 year planning horizon. For program descriptions, please refer to the current approved DSM plan (2014-2017 Power Smart Plan). For programs not approved but where placeholders are used, detail program descriptions are not available at this time.

Program Duration and Cumulative Participation
2014/15 - 2028/29

Programs	Program Category	Electric	Natural Gas	Program Launch Date	Particpation Definition	Cumulative Participation by 2028/29
Residential						
New Home Program	Incentive Based	√	√	Apr-2017	No. of houses	1,772
Home Insulation Program	Incentive Based	√	√	May-2004	No. of houses	25,220
Water and Energy Saver Program	Incentive Based	√	√	Sep-2010	No. of houses	335,484
Affordable Energy Program	Incentive Based	√	√	Dec-2007	No. of retrofits	24,025

Customer Sited Load Displacement	Incentive Based	√		Apr-2014	No. of customers	61

** Participation recurs annually*

1.4 Economic Assumptions

Marginal Costs

The 2014–17 Power Smart Plan – 15 year supplemental report incorporated the following forecasts to estimate the marginal benefits for energy savings resulting from the revenue realized from conserved electricity being sold in the export market, the avoided costs of new transmission and the supply of natural gas:

- Electric – The electric marginal cost forecast was prepared and compiled by the Resource Planning and Market Analysis Department. Marginal values were provided for savings at the distribution level, transmission level, generation level and for the value of curtailable load. For the 2014-2017 Power Smart Plan - 15 year supplemental report, the following assumptions were applied:
    - Marginal costs were based on a uniform supply with a 100% capacity factor
    - Distribution Level Programs used a loss factor of 14% to translate back to generation
    - General Service Large Programs used a loss factor of 10% to translate back to generation
    - Generation Level Programs used a loss factor of 14% to translate to distribution level
    - US/Cdn Exchange Rates and Escalation Factors were derived from the Corporation's G911 corporate policy document issued August 13th, 2013
    - Transmission & distribution marginal costs were updated using SPD 2010/02

- Natural Gas – The marginal cost forecast for natural gas was prepared based on the natural gas price forecast which was provided by the Economic Analysis Department. Unlike the price forecast, it does not include distribution costs. The benefits of avoided greenhouse gas emissions were included in the natural gas marginal benefits used to calculate the Societal Cost (SC) and Total Resource Cost (TRC) metric. A greenhouse gas cost forecast was provided by the Energy Policy & Analysis Department.

- In addition, water benefits were calculated based on 2014 City of Winnipeg Water and Sewer rates effective April 1st, 2014.

Customer Rates

The following forecasts were used to determine the impact of customer bill reductions resulting from their Power Smart energy savings:

- Electric – The Electric Rates & Regulatory Department provided the rate forecast for electricity. Commercial and industrial program rates were determined by a weighted average based on the forecast participation by each of the Corporations' billing classes. Residential rates were consistent for all residential programs. For the 2014-2017 Power Smart Plan - 15 year supplemental report, the weighted rates were based on the approved May 1st, 2013 rate forecast which assumed the 2014/15 real rates would increase by 1.9% and thereafter by 1.9% per year. This was based on the projected rate increase of 3.95% for 2014/15 and the long term rate increase of 3.95% per year (as per IFF-12) less the 2014/15 escalation rate of 2.0 % and the long term escalation rate of 2.0% (2012 Economic Outlook), (represented in 2014 $).

- Natural Gas – The natural gas price forecast was prepared by the Economic Analysis Department with input from the Energy Price Outlook. For the 2014-2017 Power Smart Plan - 15 year supplemental report, the following assumptions were applied:
  - Forecast starting point was the February 1st, 2013 rate
  - Commodity price changes into the future were based on the forecast of natural gas prices contained in the Energy Price Outlook which represented a consensus view of futures markets and a suite of five independent forecasting organizations
  - Non-commodity (monthly charge, transportation, distribution) price changes were based on IFF-12 assumptions on general rate increases and the Economic Outlook assumptions on Manitoba inflation. Non-commodity price changes in the post-IFF period were based on historical trends

Economic Variables

For the 2014-2017 Power Smart Plan - 15 year supplemental report, the Projected Escalation, Interest, & Exchange Rates – G911 corporate policy document issued August 13th, 2013 was used to discount all forward-looking savings and costs. The real weighted average cost of capital of 5.4% was used to discount real dollar cash flows and energy savings. Rates for all historical benefits, costs, and energy savings used actual economic results for each year.

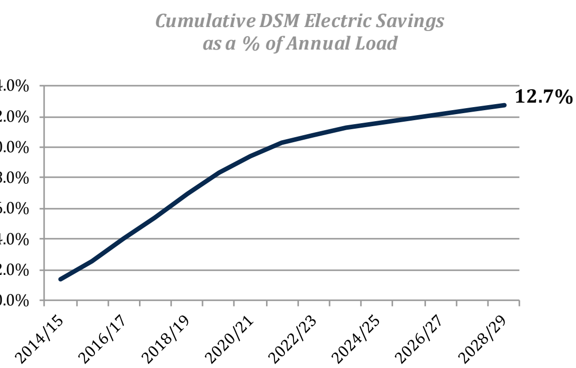
2 DEMAND SIDE MANAGEMENT

2.1 DSM Targets

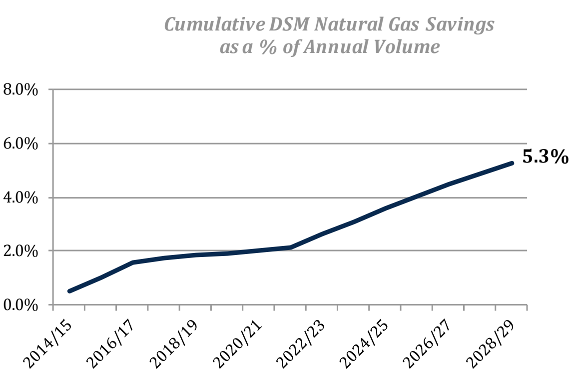
2.1.1 Electric and Natural Gas DSM Savings

In summary, the plan sets out to realize electricity savings of 1,136 MW and 3,978 GW.h, natural gas savings of 108 million cubic meters and combined global greenhouse gas emission reductions of 2.9 million tonnes by 2028/29.

This demand side management plan represents 12.7% of the estimated electric load forecast offsetting 66% of projected load growth during this period and 5.3% of the estimated natural gas volume forecast by 2028/29, further reducing natural gas consumption in Manitoba.



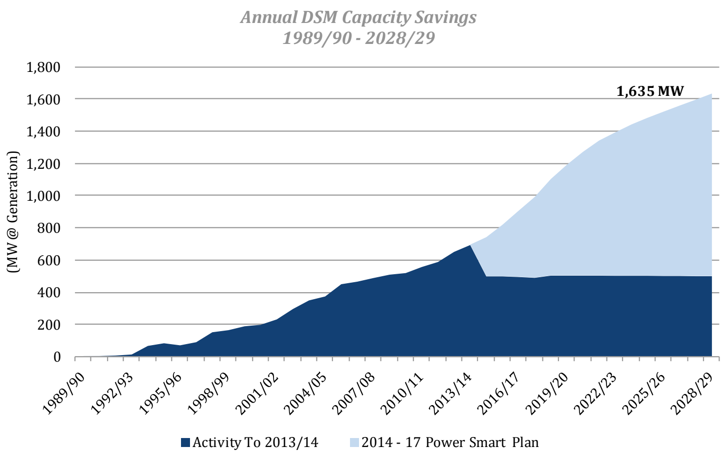
Note: Total DSM Electric savings per the above graph includes forecast savings from program impacts and savings from Codes, Standards and Regulations.
Source of Load Forecast: 2013 Electric Load Forecast

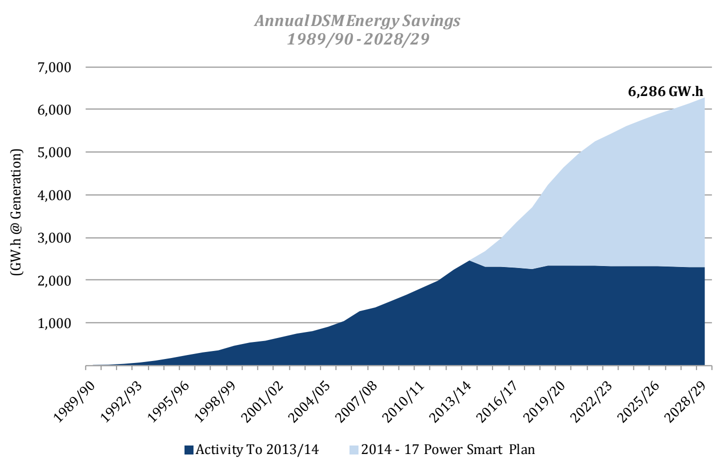


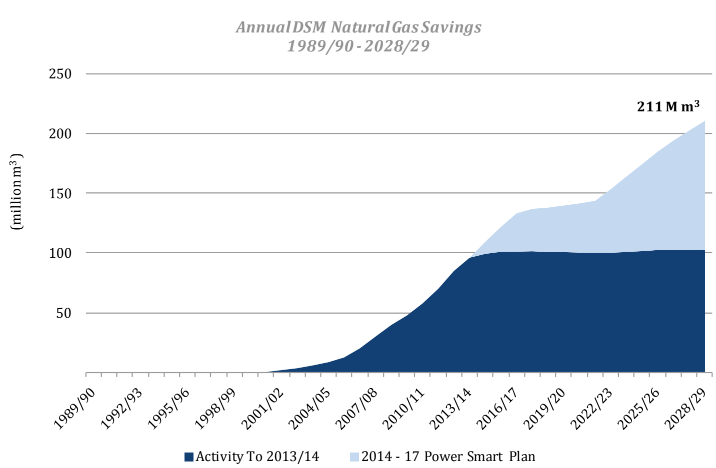
Note: Total DSM Natural Gas savings per the above graph includes forecast savings from program impacts and Codes, Standards and Regulations
Source of Natural Gas Volume Forecast: 2013 Natural Gas Volume Forecast

Combined with energy savings achieved to date, total electrical savings of 1,635 MW and 6,286 GW.h and total natural gas savings of 211 million cubic meters will be realized by 2028/29. These combined energy savings are expected to result in an overall reduction of greenhouse gas emissions of 4.6 million tonnes by 2028/29. This activity represents 20.1% of the estimated electric load forecast and 10.2% of the estimated natural gas volume forecast by 2028/29.

The following charts graphically represent the capacity, electric energy and natural gas energy savings achieved to date and the savings anticipated from future DSM activity for the 2014-2017 Power Smart Plan - 15 year supplemental report:







The following table shows detailed DSM savings associated with the 2014-2017 Power Smart Plan - 15 year supplemental report by sector to 2028/29.

Electric and Natural Gas DSM Savings
2014/15 - 2028/29

	Annual Capacity (MW)		Annual Energy (GW.h)		Annual Energy (million m^3)

2.1.2 Other Fuel Savings

Through funding from the Affordable Energy Fund, residential customers using heating sources other than natural gas and electricity are eligible to participate in the Home Insulation, Water & Energy Saver and Oil & Propane Furnace Replacement programs. The following table provides the oil and propane fuel savings estimated to be achieved through this funding.

It is estimated that savings of 399,400 litres of fuel oil and 180,700 litres of propane will be achieved from 2014/15 to 2028/29.

Affordable Energy Fund Other Fuel Savings
2014/15 - 2028/29
(000s, litres)

	2014/15	2015/16	2016/17 - 2028/29
Fuel Oil Savings			
Home Insulation Program	6.0	6.0	54.4
Water & Energy Saver Program	4.6	4.6	4.6
Oil & Propane Furnace Replacement	46.0	46.0	227.1
Annual Fuel Oil Savings	56.6	56.6	286.1

Annual Propane Savings	22.9	22.9	134.9
Cumulative Propane Savings, 2014/15 - 2028/29	22.9	45.9	180.7

2.1.3 Energy Efficient Codes, Standards & Regulation Savings

Many Canadian and U.S. electric utilities, including Manitoba Hydro, have been engaged in DSM activities for more than two decades. In addition to utility specific DSM programs, Manitoba Hydro's strategy to affect change in codes and standards involves being an aggressive and active participant and, in many cases, a driving force on a number of provincial and national energy efficiency codes and standards committees. These codes and standards are subsequently referenced in national and provincial regulations that mandate minimum energy performance levels for a variety of appliances, buildings and other energy consuming measures. The focus of Manitoba Hydro's efforts on these committees is to advance the progress of product efficiency improvements through the development of test methodologies that facilitate measurement and comparison of energy performance and provide for minimum energy performance levels that reasonably represent performance improvements available from commercially viable product advancements, which are then incorporated into Manitoba Power Smart programs, and subsequent energy efficiency regulations and building codes proposed by national and provincial regulators.

Not all codes and standards are regulated, with some codes and standards being developed for the purpose of supporting good business practices that assist customers in quantifying and comparing the energy performance of measures being considered for implementation. In these instances, Manitoba Hydro supports the adoption of such non-regulated codes and standards within its Power Smart programs.

Manitoba Hydro annually prepares a forecast of the expected influence of both regulated and non-regulated codes and standards, and since 1995 this forecast has been used to adjust Manitoba Hydro's system load forecast.

Strategic Steering Committee on Performance, Energy Efficiency and Renewables

Manitoba Hydro is a leading contributor on the Canadian Standards Association's Strategic Steering Committee on Performance, Energy Efficiency and Renewables (SCOPEER). This Canadian Standards Association committee, with participation from federal and provincial authorities, electric utilities, industry associations and equipment suppliers, provides oversight and governance for the process used to develop energy performance standards and establish minimum energy performance levels for energy consuming measures across most residential, commercial and industrial sectors. SCOPEER includes Technical Committees responsible for specific end-use technology areas, including Heating, Ventilation, Air Conditioning and Refrigeration Equipment (TC 401), Industrial Equipment (TC 402), Residential Equipment (TC 403), Lighting Equipment (TC 419), Solar Equipment (TC 420) and Energy Management (TC 422). Individual Technical Subcommittees operating within each of the Technical Committees are responsible for the development of specific standards related to the energy performance of end-use measures that are vetted and approved by the SCOPEER committee for adoption. Electric utilities, equipment suppliers and consumer reference these standards within their programs and specific areas of activity, while regulatory agencies at the national and provincial level adopt these standards and their associated minimum energy performance levels into energy efficiency regulations.

Energy Savings from Codes & Standards

In many markets, the most effective and permanent form of market transformation for energy efficient technologies and practices is the regulation of energy efficient codes and standards as such regulations ensures that customers do not revert to less efficient technologies/practices once the incentives and/or promotional activities are discontinued. Consequently, the process of achieving these changes is complex and lengthy as it involves many stakeholders, varying environmental and market conditions and market acceptance to ensure successful implementation.

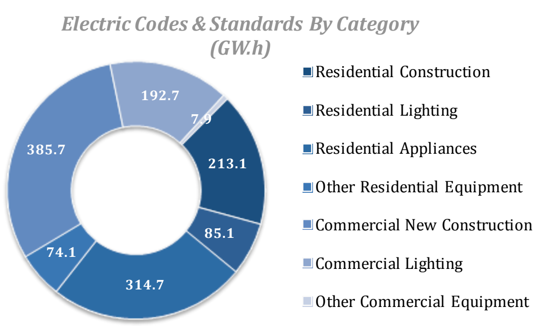
Efforts to achieve energy savings through Energy Efficient Codes and Standards initiatives are forecasted in the 2014-2017 Power Smart Plan - 15 year supplemental report to achieve capacity savings of 419 MW, energy savings of 1273 GW.h and 84 million cubic meters of natural gas annually by 2028/29. As a result of these savings, a greenhouse gas emissions reduction of 1.0 million tonnes is expected by 2028/29.

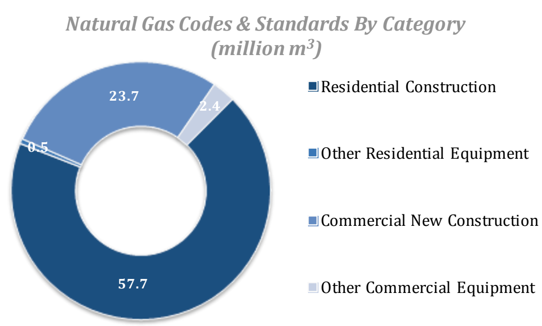
The following table and charts provide a summary of the planned energy savings in 2028/29 from codes and standards that currently implemented in energy efficiency regulation at the provincial and national level. Future DSM plans will provide updated forecasts of savings from codes and standards based on new information, such as the pending proposals being put forward by Natural Resources Canada for Amendments 13 and 14, which include both new or enhanced energy efficiency regulations for a variety of energy consuming measures.

Energy Savings from Codes & Standards
2014/15 - 2028/29

Code Category	Components	Energy and Demand Savings Winter MW	Annual GW.h	Natural Gas Annual millions m³	CO2 Reductions Annual Tonnes
Residential Construction	Insulation, Windows, Pilot Light Gas Fire Place, Furnance, Heat Recovery Ventilation, Showerhead	106.5	213.1	57.7	253,601
Residential Lighting	General Service Lamps	20.3	85.1	0.0	57,418
Residential Appliances	Dishwashers, Clothes Washers, Clothes Dryers, Refrigerators, Freezers, Ranges, Stoves, Cooktops	54.1	314.7	0.0	212,453
Other Residential Equipment	Electric Hot Water Tank, Central Air Conditioning, Residential Furnace	3.1	74.1	0.5	51,023
Commercial New Construction	Various Building Code Amendments	170.9	385.7	23.7	305,407
Commercial Lighting	General Service Lamps, Exit Signs, Fluorescent Lamp Ballasts	53.6	192.7	0.0	130,105
Other Commercial Equipment	Commercial Furnace, Boiler and Spray Valves	10.6	7.9	2.4	9,897
Total @ Generation		419	1273	84	1,019,905

** Totals per above include savings attributed to specific Power Smart programs and thus differ from Codes and Standards savings reported in Appendices A.1, A.3 and C.1*





Status of Codes and Standards

The following table summarizes the status of changes to provincially and nationally regulated codes and standards included in the 2014-2017 Power Smart Plan - 15 year supplemental report, including actual or expected dates for implementation.

For electricity, changes that account for 67% of total energy savings have been enacted and 33% are planned.

For natural gas, changes that account for 64% of total energy savings have been enacted and 36% are planned.

Status of Changes to Codes and Standards

Code Category	Components	Energy Annual GW.h	Natural Gas Annual million m^3	Level of Government	Enacted	Expected Effective Date Announced	Expected Effective Date Planned
Residential Construction	Building Code - Insulation	38.4	6.0	MB	2008

Total (million m^3)			84		54	0.2	30
					64%	0%	36%

Code, Standard & Regulation Descriptions

The following section describes each of the codes and standards listed in the Summary Table noted in Section 2.1.3 that have been taken into consideration when developing a forecast for projected savings.

Residential Construction

Building Code
Manitoba Building Code, amendment (PROVINCIAL)
Regulation 4/2008
Registered: January 11, 2008
Effective date: October 1, 2008

Manitoba Hydro has been offering the Power Smart New Home program to customers across the province since 2004. The New Home program promoted and offered incentives to customers for the installation of energy efficient technologies and building practices within the New Home construction industry. Manitoba Hydro worked closely with industry stakeholders like the Manitoba Home Builders' Association when developing requirements for the program. Specifically, the Power Smart New Home program has required and been promoting a minimum requirement for R20 insulation in the foundation walls of new homes since 2004.

Changes to Table 9.25.5.2. (Minimum Thermal Resistance for the Building Envelope) of the Manitoba Building Code (Regulation 127/2006) came into effect on October1, 2008. The changes related to the minimum requirement for insulation R-value for the interior and exterior foundation walls of new homes. The code change increased the minimum required insulation value from R12 to R20.

Building Code
Manitoba Building Code, amendment (PROVINCIAL)
Regulation 142/2010
Registered: October 4, 2010
Effective date: December 1, 2010

Manitoba Hydro has promoted energy efficient technologies and building practices within the residential new construction segment through delivery of the Power Smart New Home Program. When developing program requirements, Manitoba Hydro worked closely with industry stakeholders like the Manitoba Home Builders Association.

Through the delivery of the Power Smart Gold Home offering, Manitoba Hydro planned to aid the advancement of future building code by promoting and offering incentives to customers to build their home with Power Smart recommended technologies and construction practices. The Gold standard announced in 2007 required the use of heat recovery ventilators (HRV), 94 % AFUE furnaces, electronic ignition for natural gas fireplaces, R50 attic insulation, water efficient fixtures and many other building envelope improvements.

Effective December 1st, 2010, Manitoba implemented changes to the building and plumbing codes that increased energy and water efficiencies. These changes were the result of extensive consultations by the Office of the Fire Commissioner involving new homebuilders, contractors and technical experts. The new efficiencies incorporated into new construction and homes undergoing extensive renovations included:

- specifying minimum energy-efficiency requirements for windows,
- eliminating the pilot light in gas fireplaces,
- increasing the required level of attic insulation to R50,
- requiring a minimum 94 per cent fuel-efficiency rating for furnaces,
- specifying a mid-efficient heat-recovery ventilator, and
- introducing energy-modeling software that will allow builders to model alternatives to the code requirements.
- Requiring a maximum flow rate for primary showerheads to 1.75 GPM

Through its close working relations with key industry stakeholders and the Power Smart New Home Program offering, Manitoba Hydro succeeded in advancing these changes to the Manitoba Building code. In fact, a majority of the technologies adopted by the Manitoba Building Code for the December 1, 2010 update were part of the aforementioned Power Smart Gold Home standard requirements. Without the program providing information, education, training, and incentives for these technologies and building practices, the industry would have been less likely to adopt these technologies and transform the market. The program created demand for these technologies, provided builders an opportunity to gain experience using them, and provided trades and contractors training opportunities to advance their expertise and knowledge of the technologies.

<u>Building Code</u>
Manitoba Building Code, amendment (PROVINCIAL)
Regulation (Proposed)
Effective date: 2020

Manitoba Hydro is currently assessing the Power Smart New Home program. The program will promote and offer incentives to customers for the installation of energy efficient technologies and building practices within the New Home construction industry. Manitoba Hydro will work closely with industry stakeholders with the aim to build market acceptance of Power Smart New Home technologies for ease of adoption in the Manitoba Building Code in 2020.

Residential Lighting

General Service Lamps
National Resources Canada (FEDERAL)
Amendment 12B to Energy Efficiency Regulations
Published: January 15, 2014 (Canada Gazette Part II)
Effective date(s): January 1st, 2014 - 75 to 100 watt equivalent lamps
December 31st, 2014 - 40 to 60 watt equivalent lamps

The Government of Canada announced in Amendment 12B to the Energy Efficiency Regulations, published on January 15, 2014 that they would introduce Minimum Energy Performance Standards (MEPS) for general service lamps in 2012. The consequent Regulations came into force in December 2013 and applied to 100 and 75 W bulbs manufactured on or after January 1, 2014, and to 60 and 40 W bulbs manufactured on or after December 31, 2014. The Regulations prohibit the importation and interprovincial shipment of non-compliant products. The Regulations provide for a number of alternatives to inefficient bulbs. Where no alternatives exist, exemptions are made.

Residential Appliances

Manitoba Hydro is a key player on the Canadian Standards Association's Strategic Steering Committee on Performance, Energy Efficiency and Renewables (SCOPEER). This committee is responsible for changes to provincial and national performance standards and legislation which have resulted in the improvement of energy utilization of numerous appliances such as dishwashers, clothes washers & dryers, refrigerators and freezers, and ranges/stoves/cooktops.

Other Residential Equipment

Hot Water Tank Standby Losses
National Resources Canada (FEDERAL)
Amendment 8 to Energy Efficiency Regulations
Test Standard: CAN/CSA-C191-00
Published: September 22, 2004 (Canada Gazette Part II)
Effective date(s): July 1, 2004

Standby heat loss is the heat lost and energy wasted by heating water and storing it in a tank such as the case with traditional tank hot water heaters. That is, heat leaches from the tank to the surrounding air, causing the heater to heat up the water again Storage water heater models with heavily insulated tanks can significantly reduce heat loss.

In 2004, the CSA published a standard (C191-00) which specified requirements related to delivery, minimum standby performance, heater element ratings, and marking of electric storage tank water heaters. For standards, standby heat loss savings are based on the water heated for use by dishwashers and clothes washers.

Central Air Conditioning
National Resources Canada (FEDERAL)
Amendment 9 to Energy Efficiency Regulations
Test Standard: CAN/CSA-C656-05
Published: November 15, 2006 (Canada Gazette Part II)
Effective date(s): November 15, 2006

In November 2006, the CSA published a standard (C656-05) which specified mandatory MEPS applied to permanently installed 'air-source' air-conditioner and heat pumps. Equipment types include air conditioners and heat pumps that are single package and split system, single and three-phase, with rated capacity of less than 19 kW (65,000 Btu/h). For air conditioners, a minimum SEER rating of 13 was mandated.

Manitoba Hydro provides a fixed interest finance plan that may be used for renovations including central air, mid-efficient natural gas/electric furnaces and water heaters, direct vent natural gas fireplaces, security lights and fixtures under the Energy Finance Plan. Pre 2005, a minimum SEER rating of 10 for Air Conditioners was required for eligibility for financing under the plan. In order to comply with the forthcoming national standard, Manitoba Hydro raised the minimum SEER to 13 for eligibility of financing in October, 2005; approximately one year earlier.

<u>Residential High Efficiency Furnace</u>
National Resources Canada (FEDERAL)
Amendment 10 to Energy Efficiency Regulations
Published: December 24, 2008 (Canada Gazette Part II)
Effective date: December 31, 2009

On December 12, 2008 the Federal Government amended the Energy Act to require increased efficiency requirements for replacement gas (natural gas and propane) furnaces and boilers. Effective December 31, 2009 replacement furnaces up to 225 000 Btu/h sold in Canada are required to have a minimum AFUE of 90%.

Manitoba Hydro played a material role in the amendment of the Federal Energy Act. Manitoba Hydro staff assisted the Federal Government by providing technical and market data regarding the heating market in Manitoba and comments to the proposed Amendment during the consultation process. Power Smart Programs such as the Residential Loan and the High Efficiency Furnace and Boiler Rebate influenced the Manitoba market to the point that 80% of all equipment installed in 2009 was high efficiency products, thus making the Amendment acceptable to the industry and to consumers.

The Energy Act (PROVINCIAL)
Regulation 181/2009
Published: November 12, 2009
Effective date: December 30, 2009

On November 12, 2009 the Manitoba Government passed a regulation under the Energy Act to require increased efficiency requirements for replacement gas (natural gas and propane) furnaces and boilers. Effective December 30, 2009 replacement furnaces up to 225 000 Btu/h sold in Manitoba are required to have a minimum AFUE of 92%.

Manitoba Hydro played a major role in the development of the Provincial Regulation. Manitoba Hydro staff assisted the Province by providing technical and market data regarding the heating market, hosting an industry consultation with contractors and other interested parties, preparing a formal market impact study, and providing general guidance to regulatory staff. Power Smart Programs such as the Residential Loan and the High Efficiency Furnace and Boiler Rebate influenced the market to the point that 80% of all equipment installed in 2009 was high efficiency products, thus making regulation acceptable to the industry.

Commercial New Construction

Building Code

The national commitment to update the 1997 National Energy Code for Buildings (NECB) was initiated in Manitoba by the Energy Code Advisory Committee (ECAC) which was led by Manitoba Hydro. Manitoba Hydro also chaired the national Building Energy Code Collaborative (BECC), which was formed in response to the recommendations provided by ECAC. As a result of the work done by BECC, formal support was provided by jurisdictions across Canada to undertake the work to update the 1997 NECB and a national working group was formed to conduct the detailed work for updating the code. Manitoba's Minister of Labour provided formal support that signaled Manitoba's intention to adopt the document once published, however the Province still moved forward with their own energy strategy and convened a sub-committee of the Building Standards Board of Manitoba to recommend Manitoba-based energy and water efficiency recommendations that could be implemented in advance of the release of the 1997 NECB.

In January 2011, the energy efficiency amendments developed for the Manitoba building code were approved by the Building Standards Board of Manitoba and the Minister of Labour. However, with the NECB already through its public consultation phase and targeting a release date of Fall 2011, it was decided to hold back on regulating the specific Manitoba amendments so that a review and implementation of the NECB could be implemented. The sub-committee that developed the Manitoba amendments was reconvened in fall of 2012 with the task of reviewing the NECB and determining its applicability to the Manitoba market. Once again, Manitoba Hydro played a key role with several Power Smart staff contributing to this process. The sub-committee provided a recommendation that was formally adopted with minor adjustments in the December of 2013 for implementation and enforcement in December of 2014.

Manitoba Hydro staff continues to contribute to the national process for the development of the 2015 edition of the NECB and several Customer Engineering Services staff members formally attend regular code development meetings to ensure Manitoba Hydro objectives are met. Manitoba Hydro staff are also members of the Manitoba Building Standards Board Sub-Committee on Energy and Water Efficiency, which is responsible for recommending that the Province adopt the 2011 NECB and creation of additional recommendations specific to Manitoba that will be incorporated as amendments.

Commercial Lighting

Since 1992, Manitoba Hydro has been actively promoting energy efficient lighting technologies for commercial applications. Activities involved in developing lighting standards include:

- Collaboration with other utilities, identify necessary research
- Work with Canadian Electrical Association
- Liaise with manufacturers to encourage the development and improvement of energy efficient lighting
- Product testing
- Liaise with National Research Council
- Participation on the CSA Standards Setting Committee
- Participation on the Canadian Lighting Industry Collaborative

<u>General Service Lamps</u>
National Resources Canada (FEDERAL)
Amendment 12B to Energy Efficiency Regulations
Published: January 15, 2014 (Canada Gazette Part II)
Effective date(s): January 1st, 2014 - 75 to 100 watt equivalent lamps
December 31st, 2014 - 40 to 60 watt equivalent lamps

The Government of Canada announced in Amendment 12B to the Energy Efficiency Regulations, published on January 15, 2014 that they would introduce Minimum Energy Performance Standards (MEPS) for general service lamps in 2012. The consequent Regulations came into force in December 2013 and applied to 100 and 75 W bulbs manufactured on or after January 1, 2014, and to 60 and 40 W bulbs manufactured on or after December 31, 2014. The Regulations prohibit the importation and interprovincial shipment of non-compliant products. The Regulations provide for a number of alternatives to inefficient bulbs. Where no alternatives exist, exemptions are made.

<u>Exit Signs</u>
National Resources Canada (FEDERAL)
Amendment 8 to Energy Efficiency Regulations
Test Standard: CAN/CSA-C860-01
Published: September 22, 2004 (Canada Gazette Part II)
Effective date: November 1, 2004

In September of 2004, Natural Resources Canada's (NRCan's) Office of Energy Efficiency (OEE) amended Canada's Energy Efficiency Regulations (the Regulations) in order to strengthen the minimum energy performance standard for internally lighted exit signs with the publication of Amendment 8 in Canada Gazette Part II. This standard contains voluntary minimum performance standards of 22 watts for signs 120 V or less, and 27 watts for signs greater than 120 V. These levels were harmonized with the National Building Code of Canada. The standard also addresses the visibility performance of the exit sign. To meet these standards, typically requires that LED technology be employed. In the area of LED lighting, the program supported these minimum efficiency levels for new exit signs with signs set at a level that only LED exit signs could meet.

<u>Fluorescent lamp ballasts</u>
National Resources Canada (FEDERAL)
Amendment 9 to Energy Efficiency Regulations
Test Standard: CAN/CSA-C654-M91
Published: November 15, 2006 (Canada Gazette Part II)
Effective date(s): November 15th, 2006 (New Construction Market)
April 1st, 2010 (Renovation Market)

In November of 2006, Natural Resources Canada's (NRCan's) Office of Energy Efficiency (OEE) amended Canada's Energy Efficiency Regulations (the Regulations) in order to strengthen the minimum energy performance standard for florescent lamp ballasts with the publication of Amendment 9 in Canada Gazette Part II. Manitoba Hydro's lighting initiative helped support this Federal code change that required fluorescent lamp ballasts meet a prescribed minimum energy performance standard in the new construction market in 2006 and the renovation market in 2010.

Other Commercial Equipment

<u>Commercial High Efficiency Furnace</u>
National Resources Canada (FEDERAL)
Amendment 10 to Energy Efficiency Regulations
Published: December 24, 2008 (Canada Gazette Part II)
Effective date: December 31, 2009

On December 12, 2008 the Federal Government amended the Energy Act to require increased efficiency requirements for replacement gas (natural gas and propane) furnaces and boilers. Effective December 31, 2009 replacement furnaces up to 225 000 Btu/h sold in Canada are required to have a minimum AFUE of 90%.

Manitoba Hydro played a material role in the amendment of Canada's Energy Efficiency Act. Manitoba Hydro staff assisted the Federal Government by providing technical and market data regarding the furnace market in Manitoba and comments to the proposed Amendment during the consultation process. Power Smart programs such as the Power Smart Residential Loan, the Residential High Efficiency Furnace and Boiler Rebate, and the Commercial HVAC Program - High Efficiency Furnace incentive all influenced market adoption; increasing market penetration of high efficiency furnaces in Manitoba commercial buildings from the pre-program average of 30% to 75% at program termination. Manitoba Hydro's involvement has expedited market transformation and thus facilitated the adoption of the federal efficiency regulation.

The Energy Act (PROVINCIAL)
Regulation 181/2009
Published: November 12, 2009
Effective date: December 30, 2009

On November 12, 2009 the Manitoba Government passed a regulation under the Energy Act to require increased efficiency requirements for replacement gas (natural gas and propane) furnaces and boilers. Effective December 30, 2009 replacement furnaces up to 225 000 Btu/h sold in Manitoba are required to have a minimum AFUE of 92%.

Manitoba Hydro played a material role in the development of the provincial efficiency regulation. Manitoba Hydro staff assisted the Manitoba Government by providing technical and market data, hosting an industry consultation with contractors and other interested parties, preparing a formal market impact study, and providing general guidance to regulatory staff. Power Smart programs such as the Residential Loan, the Residential High Efficiency Furnace and Boiler Rebate, and the Commercial HVAC Program - High Efficiency Furnace incentive all helped to expedite market adoption of high efficiency furnaces in Manitoba commercial buildings from the pre-program average of 30% to 75% at program termination. Manitoba Hydro's active involvement had expedited market transformation, and thus facilitated the adoption of the provincial efficiency regulation.

<u>Commercial Boilers</u>
National Resources Canada (FEDERAL)
Bulletin published: August 2010
Test Standard: HI BTS 2000, Rev 06.07 Method to Determine Efficiency of Commercial Space Heating Boilers
Proposed Effective date(s): March, 2015 (90% Min Efficiency Rating - New Construction Market)
March, 2015 (85% Min Efficiency Rating - Existing Buildings Market)

In August of 2010, Natural Resources Canada's (NRCan's) Office of Energy Efficiency (OEE) Natural Resources Canada (NRCan) proposed to amend Canada's ENERGY EFFICIENCY REGULATIONS (the Regulations) to require dealers to comply with minimum energy performance standards (MEPS) for commercial gas and oil-fired boilers, imported or shipped inter-provincially, for sale or lease in Canada. NRCan proposes that commercial packaged boilers meet minimum efficiency ratings of 90% for the New Construction mark and 85% for the Replacement Market, effective March, 2015.

Manitoba Hydro proposes that the Provincial Government enact regulations under The Energy Act, requiring a minimum performance level for all natural gas boilers sold to new Manitoba buildings. By April 1 2013, Manitoba Hydro proposes that all commercial boilers be condensing, with a minimum efficiency rating of 90%. This regulation is equivalent to the proposed federal regulation, but will be enacted two years earlier.

Manitoba Hydro will play a material role in the development of a provincial efficiency regulation for commercial natural gas boilers. Manitoba Hydro staff will assist the Manitoba Government by providing technical and market data, hosting an industry consultation with contractors and other interested parties, preparing a formal market impact study, and providing general guidance to regulatory staff. The Commercial HVAC Program will continue to expedite market adoption of high efficiency boilers in all commercial buildings from it pre-program average of 30% to an estimated 72% by April 2013, thus facilitating the adoption of a provincial performance standard two years earlier than the rest of Canada.

Manitoba Hydro proposes that the Provincial Government enact regulations under The Energy Act, requiring a minimum performance level for all natural gas boilers sold to existing Manitoba buildings. By March 2015, Manitoba Hydro proposes that all commercial boilers be condensing, with a minimum efficiency rating of 90%. This is approximately 5% higher than the proposed federal regulation requiring all boilers sold to be at least 85% efficient (near-condensing).

Manitoba Hydro will play a material role in the development of a provincial efficiency regulation for commercial natural gas boilers. Manitoba Hydro staff will assist the Manitoba Government by providing technical and market data, hosting an industry consultation with contractors and other interested parties, preparing a formal market impact study, and providing general guidance to regulatory staff. The Commercial HVAC Program will continue to expedite market adoption of high efficiency boilers in all commercial buildings from it pre-program average of 30% to an estimated 75% by March 2015, thus facilitating the adoption of a higher performance standard in Manitoba.

<u>Commercial Pre Rinse Spray Valve</u>
Manitoba Plumbing Code
Regulation 32/2011
Adoption of National Plumbing Code of Canada 2010
Published: March 28, 2011 The Buildings and Mobile Homes Act (C.C.S.M. c. B93)
Effective date: April 1, 2011

On April 1, 2011 the Manitoba Government repealed the Manitoba Plumbing Code, Manitoba Regulation 128/2006 and adopted the National Plumbing Code of Canada 2010 issued by the Canadian Commission on Buildings and Fire Codes, National Research Council Canada. The code states that the maximum flow rate for a pre-rinse spray valve not exceed 6.1 litres per minute (1.60 gallons per minute). The Power Smart Rinse & Save Program influenced market adoption; converting the Manitoba market to pre-rinse spray valves with equal or higher energy efficiency than the code. Manitoba Hydro's involvement has expedited market transformation and thus facilitated the adoption of the code.

At an Industrial level, Manitoba Hydro undertakes codes and standards development work with the following organizations:

- Natural Resources Canada (NRCAN)
- Province of Manitoba
- Canadian Standards Association (CSA), including BC Hydro, Hydro Quebec, Ontario Power Authority, Ontario Ministry of Energy, etc)
- Centre for Energy Advancement through Technological Innovation (CEATI)
- US Department of Energy (DOE)
- Institute of Electronic and Electrical Engineers (IEEE)
- International Electrotechnical Commission (IEC)
- American Council for an Energy-Efficient Economy (ACEEE)
- Electric Power Research Institute (EPRI)
- Energy Solutions Center (ESC)
- American Society of Heating, Refrigeration and Air-Conditioning Engineers (ASHRAE)
- Canadian Gas Association (CGA)

This work pertains primarily to industrial and commercial equipment that incorporates or applies to electric motors, variable speed drives, air compressors, compressed air systems, fans, pumps, transformers, power quality systems, battery charges, uninterruptible power supplies, lighting systems, refrigeration, heating, ventilation and air conditioning systems, and building envelope incorporating both natural gas and electric supply.

Areas of involvement include, test methods for determination of energy efficiency, performance standards, application guides for efficiency test methods and performance standards and repair standards (to maintain efficiency). Industrial codes and standards are often developed as non-regulated mechanisms designed to support good practices in the selection, operation and maintenance of energy consuming measures. As such, these codes and standards are incorporated into Manitoba Hydro's Industrial Power Smart programs supporting the savings objectives of these programs.

2.2 DSM Utility Investment

2.2.1 Internal Sources

The following table provides the cumulative electric and natural gas internal DSM investment totals to 2028/29 broken down by market sector and cost basis. Including other internal DSM investments, it is expected that by 2028/29, an additional cumulative investment amount of $978 million dollars will have been spent on Power Smart programs and initiatives. Including investments to date, it is expected that by 2028/29, a cumulative investment of achieving the energy savings will have been $1.6 billion dollars.

Internal DSM Utility Investment
2014/15 - 2028/29

	Electric Cumulative Utility Costs (Millions 2014$)		Natural Gas Cumulative Utility Costs (Millions 2014$)		Total Cumulative Utility Costs (Millions 2014$)		
Residential							
New Home Program	$2.3		$0.1		$2.4		
Home Insulation Program	$16.6		$15.4		$32.0		
Water and Energy Saver Program	$5.0		$3.2		$8.2		
Affordable Energy Program							
Affordable Energy Program - Insulation	$16.7		$35.6		$52.4		**
Affordable Energy Program - Furnace	n/a		$19.3		$19.3		**
Affordable Energy Program - Total	$16.7		$54.9		$71.7		**
Refrigerator Retirement Program	$6.6		$0.0		$6.6		
Residential LED Lighting Program	$1.9		$0.0		$1.9		
Community Geothermal Program	$21.1		$0.0		$21.1		
Opower (Behavioral)	$0.0		$0.0		$0.0		
Residential Programs Total	$70.1	10%	$73.7	61%	$143.8	17%	
Commercial							
Commercial Lighting Program	$92.3		$0.0		$92.3		
LED Roadway Lighting Conversion Program	$40.4		$0.0		$40.4		
Commercial Building Envelope - Windows Program	$11.8		$6.7		$18.5		
Commercial Building Envelope - Insulation Program	$12.6		$20.9		$33.5		
Commercial Geothermal Program	$47.6		$0.0		$47.6		
Commercial HVAC Program - Boilers	n/a		$2.4		$2.4		
Commercial HVAC Program - Chillers	$2.0		$0.0		$2.0
