#### Order 116/08 Directive 19 Revisions to PCOSS08

The attached Electric Cost of Service schedules are filed to comply with Directive 19 in PUB Order 116/08 requiring Manitoba Hydro to re-file the results of the 2007/08 Prospective Cost of Service Study ("PCOSS08") with modifications as directed in that Order. Order 116/08 was issued subsequent to PUB Order 90/08 which dealt with Manitoba Hydro's 2008/09 General Rate Application. Order 116/08 provided further direction on a number significant matters including directing Manitoba Hydro to make some specific modifications to the Corporation's Cost of Service Study ("COSS") that had been filed as part of the 2008/09 GRA as compliant with earlier Cost of Service Order 117/06. Directed modifications are discussed below.

# a) Manitoba Hydro was directed to re-file the study using the methodology as defined by Order 117/06 (Directive 19(a)).

Manitoba Hydro has revised PCOSS08 to reflect the intention of the PUB as clarified in Order 116/08. Differences from the methodology used by Manitoba Hydro in preparing PCOSS08 as per order 117/06 and PCOSS08 as revised pursuant to the clarifications issued in Order 116/08 are discussed in the remainder of the document.

#### b) The PCOSS should incorporate diesel and exports in the same fashion as other domestic customer classes (Directive 19(b)).

As directed the Export and Diesel classes have been incorporated, and disclosed, in the study in the same fashion as other customer classes as shown in Schedules 5 and 6.

# c) Fifty percent of fixed and 100% variable thermal plant costs are to be directly assigned to the Export class. (Directive 19(c)).

In Order 117/06 Manitoba Hydro was directed to allocate costs to the export customer class in a manner that reflected cost causation, and in particular, costs assigned to the Export class were to include thermal plant costs.

In PCOSS08 filed to support the 2008/09 GRA, Manitoba Hydro assigned the thermal fuel costs to the export customers, while the remaining operating and maintenance, interest and depreciation expense were allocated as part of the generation pool. Manitoba Hydro believed this treatment was the closest cost-causal interpretation consistent with the directive. MIPUG provided support for Manitoba Hydro's interpretation and agreed that the treatment did not appear unreasonable.

In Order 116/08 the Board stated that while it understood the rationale that "thermal plants provide dispatchable energy, increase dependable energy for export, and enhance the reliability of domestic energy and, as such, all non-variable costs should be shared by both domestic and export classes", the approach "would reject the principles of cost causation and would be avoiding a proper allocation of costs" (Order 116/08, pp 270). The Directive from

Order 117/06 was modified in 116/08 to assign all fuel costs and 50% of the fixed costs to the Export class.

Manitoba Hydro continues to believe that it is inconsistent with cost causation, and therefore inappropriate to directly assign fixed thermal plant costs to the Export class, or to assign any fixed cost at all to opportunity export sales. However, as directed, 100% of the fuel costs of \$23.2 million have been directly assigned to the Export class in the revised study. The remaining fixed operating and maintenance costs (\$20.5M), interest (\$20.3M) and depreciation (\$17.5) are split evenly between exports and the generation pool. The \$52.4 million in thermal plant fixed and variable costs assigned to exports implies a cost of  $8.92\phi/kWh$  for the 587 GW.h of thermal energy forecast in PCOSS08. The remaining costs are assigned to the generation pool for allocation to the domestic and Export classes, with the export share reduced for sales deemed served by thermal generation and power purchases.

## d) Assign DSM cost directly to export class and add DSM energy savings to domestic load for Generation cost-sharing purposes (Directive 19(d)).

Order 117/06 directed Manitoba Hydro to directly assign the cost of domestic DSM to export customers, but did not provide a specific treatment for DSM energy. In PCOSS08 Manitoba Hydro interpreted the directive to mean that the associated DSM energy savings should also be assumed to serve the export market. The PUB clarified their intent in 116/08, and stated that while the costs of DSM are to be directly assigned to the export class, exports should not to be deemed to receive the benefit from the associated energy savings.

As directed Manitoba Hydro has assigned the costs of domestic DSM programs to the Export class, and added the DSM energy and capacity savings into the domestic load in this revised PCOSS. No reduction was made to the Export class energy or demand for cumulative DSM savings.

Energy savings from DSM programs are included in the PCOSS in two ways. Energy savings from programs undertaken in the past are implicitly and inextricably included in the forecast energy consumption for the class. Additional energy savings from new DSM planned for the two forecast years included in the PCOSS are then explicitly assigned to reduce forecast consumption for each class. This treatment of the DSM energy savings is consistent with PCOSS prepared prior to the issuance of 117/06.

In this revision to PCOSS08, once forecast class loads (including savings from DSM undertaken in the two forecast years) are calculated, the forecast cumulative DSM savings of 1,350 GW.h (actual to 2005/06 plus forecast for 2006/07 and 2007/08) are added back to the domestic classes in accordance with Directive 19(d). The determination of class energy including cumulative DSM is illustrated in Schedule 1. The DSM savings are assumed to have the same distribution between the twelve time periods as the forecast class energy when determining the weighted energy allocator for Generation cost-sharing purposes. The determination of marginal cost weighted class energy including cumulative DSM is illustrated in Schedule 2.

While forecast DSM savings are allocated to individual classes for rate design and use in the PCOSS, the DSM cumulative savings have only been tracked on an aggregate basis by sector, and are not available broken down by customer class. The sector aggregations can be directly matched to a specific class in the case of Residential programs, but in the cases of Industrial and Commercial programs participants belong to multiple classes. To estimate the savings on a class level, cumulative DSM savings aggregated by sector have been split using the forecast for DSM as used in the PCOSS (See Table 1). For example, if General Service Medium class was expected to provide 36% of the forecast savings from the Commercial DSM programs, then 36% of the 539 GW.h savings projected from Commercial programs to the end of 2007/08 would be added to the GSM load.

The class share of forecast sector savings from a sample of past studies (PCOSS from 1995, 1999, 2004 and 2008) has been averaged to recognize the evolution in the Power Smart programs as technologies change, existing opportunities are exhausted and new ones identified. Table 2 shows the average class share of forecast savings for the Commercial and Industrial sector programs in the sampled studies. As a PCOSS is not prepared each year, and due to the considerable effort required to produce the data, a complete analysis incorporating all years is neither practical nor even possible.

Unlike other classes that benefit from ongoing DSM programs, the Streetlighting and Sentinel conversion was completed in a single program spanning several years in the early 1990's and accordingly are not represented in Power Smart program forecasts since that time. The programs were significant, but would not be recognized in the revised PCOSS without a specific adjustment to the methodology used to estimate class share of DSM savings. A post-conversion review of the Streetlighting and Sentinel programs identified the savings realized from the conversion. As these savings are directly attributable to the lighting class, they are removed from the Commercial sector savings before allocating the remaining savings between classes.

While Manitoba Hydro believes this method of estimating class share of DSM savings is the most reasonable given the lack of historical data at the detailed level, it should be stressed that these results may vary considerably from actual class-by-class savings had they been tracked in that manner since the Power Smart program's inception.

<u>Table 1 – Cumulative DSM Energy Savings Forecast to 2007/08 (GW.h @ Generation)</u>

|  | Program<br>Savings<br>by | Codes &<br>Standards<br>Savings<br>Attributed | Total<br>Savings by |
|--|--------------------------|---|---------------------|
| Sector   | Sector                   | to Sectors                                    | Sector              |
| Residential (including Customer Service Initiatives) | 113.0                    | 279.9   | 392.9               |
| Industrial   | 349.0                    | 27.5  | 376.6               |
| Commercial (less A&R Lighting)                       | 386.5                    | 151.4   | 538.0               |
| A&R Lighting   | 42.6                     | -   | 42.6                |
| Total Energy Savings                                 | 891.1                    | 458.9   | 1,350.0             |

Table 2 – Average Class Share of Forecast Sector Savings in PCOSS

| Sector     | Res  | A&R<br>Lighting | GSS<br>ND | GSS<br>Demand | GSM   | GSL<br>0-30 | GSL<br>30-100 | GSL<br>>100 | Total |
|------------|------|-----------------|-----------|---------------|-------|-------------|---------------|-------------|-------|
| Industrial | 0.0% | 0.0%            | 2.5%      | 2.5%          | 17.3% | 17.7%       | 6.3%          | 53.8%       | 100%  |
| Commercial | 0.5% | 0.0%            | 25.8%     | 27.4%         | 36.0% | 8.4%        | 1.1%          | 0.7%        | 100%  |

Table 3 – Sector Energy Savings Assigned to Classes (GW.h @ Gen)

|               |       | A&R      | GSS   | GSS    |       | GSL   | GSL    | GSL   |         |
|---------------|-------|----------|-------|--------|-------|-------|--------|-------|---------|
| Sector        | Res   | Lighting | ND    | Demand | GSM   | 0-30  | 30-100 | >100  | Total   |
| Residential   | 392.9 |          |       |        |       |       |        |       | 392.9   |
| Industrial    | -     |          | 9.4   | 9.4    | 65.0  | 66.7  | 23.5   | 202.5 | 376.6   |
| Commercial    | 2.9   |          | 138.6 | 147.4  | 193.9 | 45.4  | 6.1    | 3.6   | 538.0   |
| A&R           |       |          |       |        |       |       |        |       |         |
| Lighting      |       | 42.6     |       |        |       |       |        |       | 42.6    |
| Total Savings | 395.8 | 42.6     | 148.0 | 156.8  | 258.9 | 112.1 | 29.6   | 206.1 | 1,350.0 |

Both Coincident Peak (CP) and class Non-Coincident Peak (NCP) demand allocators for Transmission, Subtransmission and Distribution incorporate the cumulative DSM capacity savings into the forecast class demand in a similar manner. Cumulative winter and summer demand savings by sector, excluding rate programs, have been broken down to the class level on the same basis as energy savings and added to the forecast seasonal demands used to calculate the seasonal demand (2 CP) allocator for Transmission. The determination of the seasonal demand allocator is illustrated in Schedule 3. Cumulative savings forecast to 2007/08 are 294.5 MW at Generation at winter peak, and 249.5 MW at summer peak, excluding rate programs

Demand for curtailable customers was calculated in previous PCOSS as if the customers were not curtailed at the time of the system peak. There were no curtailments in the top fifty hours, summer or winter, in the 2005/06 Load Research results used in PCOSS08 so the adjustment did not change calculated demand in the study. This adjustment to customer demand allocators, and the possible resulting increase in demand allocated costs, was offset in prior studies by crediting the affected classes with a cost reduction equal to the value of the curtailable load. However, as the demand allocators for all customer classes have now been increased by the amount of their cumulative DSM demand savings, this trade-off for the curtailable incentive is no longer applicable. As such, there is no assignment of a curtailable credit to the curtailable classes in this revised version.

The increase in class Non-Coincident Peak is estimated using the increase in winter CP and the class diversity factor, and results in an increase to total NCP load of 340.6 MW at Generation. The determination of the NCP demand allocator is illustrated in Schedule 1.

Manitoba Hydro is of the view that the treatment of DSM savings and costs, as described above, is unnecessarily cumbersome, requires significant analytical effort, provides only a rough allocation of DSM energy and demand to classes, and does not improve the results of the PCOSS. Manitoba Hydro recommends that DSM be incorporated into the PCOSS by allocating ongoing costs and benefits both to the domestic classes.

#### e) Use the most recent actual [not forecast] export prices to establish export revenue in the COSS (Directive 19(e)).

The 7,707 GWh of forecast export sales in PCOSS08 had an average price 6.362¢/kWh, while the actual average price for Market and Bilateral sales in 2005/06 (the most recent actual year at the time PCOSS08 was prepared) was 5.194¢/kWh. The actual average sales price has been adjusted for forecast CPI in 2006/07 and 2007/08 (2.0% per year) to calculate the inflation adjusted price used in the PCOSS of 5.404¢/kWh. For comparison purposes the actual average price received for export sales for the first three quarters of 2007/08 was 4.942¢/kWh.

Export revenue in the study also included \$42.5 million in Merchant or Off System sales that are made only when there are arbitrage opportunities to allow such sales to be made profitably. These price-sensitive sales are directly linked to an offsetting import purchase, the cost of which (\$35.2 million) is directly assigned to the export class as part of power purchases. There is no energy associated with these transactions in the PCOSS.

As a proxy for restating using actual export prices, total merchant sales revenue has been adjusted while purchases are held constant, to yield the same ratio of sales to purchases as realized in 2005/06. In 2005/06 the ratio of actual sales revenue to purchases was 114.4% for these transactions, compared to the 120.8% forecast for 2007/08.

Table 4 – Calculation of Revised System Merchant Sales Revenue

| 2005/06 System Merchant Sales (\$/MWh)                | 68.49  |
|---|--------|
| 2005/06 System Merchant Purchase (\$/MWh)             | 59.87  |
| Ratio of Sales:Purchase                               | 114.4% |
| Forecast System Merchant Purchases in PCOSS08 (000\$) | 35,213 |
| Adjusted System Merchant Sales in PCOSS08 (000\$)     | 40,283 |

Export revenue includes items such as MISO Transmission Credits and other export related revenues that are not related to energy sales. These items have not been adjusted in the revised PCOSS. Revised export revenue of \$475.4 million is \$76 million less than in the prior version of PCOSS08.

Table 5 – Calculation of Revised Export Revenue

|  | (000 \$) |
|--|----------|
| Export Sales at Forecast Price (7,707 GW.h @ 6.362¢/kWh)           | 490,314  |
| Adjust Export Sales to use Actual Price (5.404¢/kWh vs 6.362¢/kWh) | (73,840) |
| Merchant Sales at Forecast Price                                   | 42,538   |
| Adjust Merchant Sales to 114.4% of Forecast Merchant Purchases     | (2,255)  |
| Miscellaneous Revenue  | 18,662   |
| Revised Export Revenue   | 475,419  |

Adjusting the revenue side of the transaction requires a corresponding adjustment to the cost of the supply that is subject to many of the same market forces and conditions. The 2,028 GW.h in forecast Power Purchases included in the PCOSS have been restated to use the CPI adjusted actual price of purchased power for 2005/06 of 3.939¢/kWh, resulting in the power purchase costs directly assigned to the Export class increasing by \$5.8 million. Power Purchases also include Merchant Purchases, PSO Transmission Charges and Financial Transmission Rights. These items have not been adjusted in the revised PCOSS.

Table 6 – Calculation of Revised Power Purchases

|  | (000 \$) |
|--|----------|
| Power Purchases at Forecast Price (2,028 GW.h @ 3.652¢/kWh)            | 74,065   |
| Adjust Power Purchases to use Actual Price (3.939¢/kWh vs. 3.652¢/kWh) | 5,817    |
| Merchant Purchases at Forecast Price                                   | 35,213   |
| PSO Transmission and FTR Charges                                       | 25,181   |
| Revised Power Purchases  | 140,276  |

The net change in Manitoba Hydro revenue due to the \$76.1 million reduction in export revenue and \$5.8 million increase in Purchased Power costs is matched on the cost side by making a \$81.9 million reduction in Contribution to Reserves (a component of Interest costs included in the PCOSS) so costs continue to equal revenue in the study.

The intervenor, COALITION, has raised concerns that this would result in revenues and net costs in the PCOSS that will not match Manitoba Hydro's projected revenue requirement as per the Integrated Financial Forecast (IFF). Manitoba Hydro does not believe that the fact that PCOSS revenues do not match Manitoba Hydro's projected revenue requirement necessarily reduces the usefulness of the PCOSS results. There is already a precedent for a mismatch between the PCOSS and the IFF revenue requirement with the addition of the Uniform Rate Adjustment (URA) which increased revenue in the PCOSS without, by definition, a similar increase to the revenue requirement.

The purpose of the COSS is to determine a fair sharing of revenue requirement among the customer classes and with minor changes in export revenue the apportionment of the revenue requirement is still valid, regardless of the precise amount of revenue required. The risk is that a dramatic reduction in export revenue requires adjustments to the PCOSS that imply a considerably lower cost for Manitoba Hydro's plant, even though the Corporation's revenue requirement as identified in the IFF does not change.

Revenue Cost Coverage (RCC) ratios for the domestic classes are utilized post allocation of net export credit and the change will not be material for most classes as a result of the change in gross export revenues. There are some classes that are more sensitive to these changes than others, and could see significant changes in their RCC with dramatic changes to export revenues. The accompanying change in interest costs has the greatest impact on plant-intensive functions such as Generation and Transmission, while the reduction in net export has a uniform effect on the net cost of all functions. As a result the net cost of Generation and Transmission after allocation of exports is reduced more than other functions due to this change. Similarly, directly assigned interest costs will change, but are not offset by net export revenues in the approved methodology. Classes with a relatively higher proportion of direct costs or Generation and Transmission related costs are liable to see greater changes than average with the directed change to export revenue.

## f) Use actual [eight year] energy [SEP] prices and energy use profiles in Generation energy weighting process (Directive 19(f)).

In the version of the PCOSS08 filed during the 2008/09 GRA the energy consumption patterns from the last actual year are used to distribute forecast energy consumption into the twelve time periods, which are then weighted by the relative value of SEP energy in each period. The distribution of export energy among the twelve periods in the actual years previous to the PCOSS06 and PCOSS08 were quite different due to different water conditions in 2003/04 versus 2005/06.

The season and time of day that export sales are made by Manitoba Hydro are logically affected by changing water conditions. The pattern of domestic energy use does not share the same connection to water conditions, but is likely affected by variations in weather and other factors from year to year. Manitoba Hydro agrees that using averages improves data quality for the export customers, and to a lesser degree for the domestic classes.

Load Research data is not available to provide domestic consumption profiles over the required twelve periods for years prior to 2002/03. The revised study has used energy use profiles for the four year period from 2002/03 to the 2005/06 base year of PCOSS08. Future PCOSS will use the full eight year average as data becomes available. As expected the use of average weightings from a number of years affects the Export class distribution more than any domestic class.

Table 7 – Energy Profile Using Average of 2002/03 to 2005/06 Actual Consumptions

|             |      | Spring   |      | Summer |          |       | Fall |          |      | Winter |          |       |

|             | •    | Spring   | •    | Summer |          |       | Fall |          |      | Winter |          |       |
|-------------|------|----------|------|--------|----------|-------|------|----------|------|--------|----------|-------|
|             | On   | Shoulder | Off  | On     | Shoulder | Off   | On   | Shoulder | Off  | On     | Shoulder | Off   |
| Residential | 3.2% | 5.9%     | 4.1% | 6.4%   | 12.0%    | 6.4%  | 4.2% | 7.6%     | 5.2% | 11.2%  | 20.3%    | 13.4% |
| GSS         | 3.9% | 6.7%     | 4.0% | 8.5%   | 12.8%    | 7.5%  | 4.4% | 7.6%     | 4.6% | 10.4%  | 17.9%    | 11.5% |
| GSM         | 4.0% | 7.0%     | 4.2% | 8.7%   | 14.3%    | 8.4%  | 4.3% | 7.7%     | 4.6% | 9.6%   | 16.5%    | 10.7% |
| GSL         | 3.9% | 7.1%     | 5.4% | 7.7%   | 13.8%    | 10.5% | 3.9% | 7.3%     | 5.5% | 8.3%   | 15.2%    | 11.5% |
| Exports     | 4.0% | 7.8%     | 5.6% | 9.2%   | 17.3%    | 11.7% | 3.6% | 7.6%     | 5.5% | 6.5%   | 12.8%    | 8.4%  |

Table 9 compares the ratio of class weighted energy to their un-weighted energy under both consumption profiles, and illustrates the effect of using an averaged consumption profile versus a single year. The use of a multi-year consumption profile instead of just a single year has essentially no effect on the aggregate weighting applied to the domestic classes energy consumption, and only moderately increases the weighting applied to the export energy sales. While it is reasonable to assume that the aggregate weighting for the domestic class will not change significantly once the full eight year sample is available, it is difficult to predict the impact the additional data will have on the export aggregate weighting.

<u>Table 9 – Comparison of Aggregate Weightings of Single vs. Multi-Year Energy Profile</u>

|             | Aggregate Weight using 2002/03 to 2005/06 Profiles | Aggregate Weight using 2005/06 Profile | Increase Due to<br>Multi-Year Profile |
|-------------|--|--|---------------------------------------|
| Residential | 2.25   | 2.25                                   | 0.3%                                  |
| GSS         | 2.26   | 2.26                                   | 0.1%                                  |

#### **Revised Results of PCOSS08**

Manitoba Hydro has modeled the results of the Prospective Cost of Service Study for 2007/08 to reflect the modifications directed in Order 116/08 as discussed above. Other than the changes previously mentioned, costs and revenues in PCOSS08 have not been updated or changed in order to allow comparison between versions, and allow the effects of Order 116/08 revisions to be studied in isolation. A variance analysis illustrating the effect of incorporating these directions is included as Schedule 7. The changes were implemented on a cumulative basis in the variance analysis, and it should be noted that the impact attributed to any individual modification may be different if they had been implemented in a different sequence.

The assignment and allocation of costs as directed in Order 116/08 results in net export revenue of \$48.7 million remaining to be allocated to domestic customers, considerably lower than the \$165 million in the study prior to incorporating the 116/08 directives.

As shown in Table 12, application of Order 116/08 directives yields results similar to those from studies before the review and revision of Manitoba Hydro's Cost of Service methodology began. With the reduction of net export to only \$49 million, the distorting effects of exports on class RCC's remain. Although the study no longer explicitly allocates net export credits as an offset to Generation and Transmission costs, the assignment of sufficient Generation and Transmission expenses to the Export class to largely eliminate the net export credit has simply shifted the appearance of the allocation but not its results.

The changes perpetuate the distorting effects of export revenues that caused concern for Manitoba Hydro and some of the parties in the first place. Using the methodology from 116/08 results in four classes falling within the 0.95 - 1.05 zone of reasonableness (ZOR), three classes above the ZOR, and one below the ZOR.

The greatest impact on class RCC is from the assignment of DSM costs directly to the Export class, and the addition of DSM savings back to the domestic class load. Unfortunately the lack of detailed historic data on realized savings requires a number of assumptions and allocations to disaggregate savings to the class level, and yields an estimate for which the level of confidence is disproportionate to its impact on the results of the study.

<sup>[1]</sup>Changes to PCOSS methodology are cumulative, and the impact attributed to a specific change may vary depending on the sequence in which the steps are performed.

<sup>&</sup>lt;sup>[2]</sup> Version of PCOSS submitted during the 2008/09 GRA prepared as directed in PUB Order 117/06

<sup>[3]</sup> Above with 50% of fixed and 100% of variable Thermal costs assigned to the export class

Above with energy split between the 12 TOU periods based on the average distribution over the past four years

<sup>&</sup>lt;sup>[5]</sup> Above with DSM costs assigned to Export class, and DSM energy and capacity savings added to domestic class load

<sup>&</sup>lt;sup>[6]</sup> Above with most recent actual export/import prices used to establish export revenue and power purchases. PCOSS includes all changes directed in Order 116/08.
